She is a married woman; her husband is in Cochín China; and she is in love with the husband of her intimate friend. Because she is in love with him, she flirts with all the world as a distraction; and because she is reproached for flirting with all the world, she promises a Scotchman to run away with him to Italy and to the East; and because her secret love, Henri de Savigny, forbids her to run away to Italy and to the East, she avows her love to him—to Savigny himself—and decides to stop. But stopping, there are open to her the usual "three courses." She may abandon herself to the current of her love for Savigny, but to do so she must be deliberately bad, because she is without the temptation of very strong passion on his side. She may rejoin her husband in Cochín China—he is a non-entity to the public, but he is no doubt a reality to her. Or, middle course, and best course under the circumstances, she may contrive to see little or nothing of the man she loves with wildness and inconsequence, and of the friend whom she is

now very near to wronging. She chooses the first of these courses, and that must needs be the fatal one. Berthe, her friend, who has made every effort to save her from the Scotchman who would fain have taken her to Italy, now knows why it is that she would have gone, in a moment of mixed impulse, half noble, half degrading; and she remembers with mercy that Savigny had waited, and Blanche had plotted and planned, before at last love came to be avowed by both of them. So Berthe endures, and in making her endure, M. Feuille is true, let it be granted, to the highest type of woman. For it is only up to a given point that she endures. She ignores all, as long as all may be ignored; but when her rival, suspecting all to be known, charges her with the possession of the secret, then she endures no longer, but tells her rival to go. "And are you very sure," asks Blanche, who is now defiant—and as one writes the words, one sees Croizette suddenly rise, white and firm, mistress of all her means, from head to foot—"And are you very sure that if I went, it would be alone?" To which, in the midst of stillness, Berthe answers very quietly and slowly, "Mon malheur ne serait pas plus grand—il serait plus digne." After that, Blanche declines to go, and Berthe insists, and Blanche still declines. Then Berthe makes as if she would summon Blanche's guardian, the admiral—a fierce man, who will spurn her in a moment—but that is a revenge Berthe cannot take; all thought of revenge with her is quickly gone. All the world knows by this time, and I need not tell it in my story—that Blanche has carried whimsically a potent poison in her finger-ring. She will not endure exposure, and now the poison is her resource. But Berthe, her rival, is struck down with excitement and emotion. She calls for water, and here is the poisoned glass. With one strong look of Mdle. Croizette's, you see what thought has flashed into her mind—flashed into it and then been banished. She takes the glass herself, sips it, tastes it a little grimly; then speaks to Berthe that all will yet be well; says that with a cold and dead deliberation; and then is passionate for a moment, and kisses the other, who is still powerless and amazed; and then falters and grows pale, and clutches with nervous fingers at chair and table and dress; and gives a gasp for air, and tears the gown violently open, downwards, from the throat; and falls back, and that is the end of it.

The death-scene, while played with extreme force and apparent—I am sure not *actual*, self-abandonment, does not approach the death scenes of Mr. Irving in the presentation of physical horror. It was carried further, it is said, on the earlier nights; and if so, has been wisely stopped at the point at which we now see it. Readers who witness the performance of Mme. Favart at the Princess's will, from much that they have read before, imagine it to be less shocking, less striking, less sensational, than the death scene with Mdle. Croizette. But that is not at all likely. Those, therefore, who come to Paris with the morbid desire to see a new horror, will not see what they want; and this I wish to insist upon. Croizette's death-scene is an exhibition of true instinct, and of restrained art; but as for its being a work of genius or a crude *étude* from hospital experience—it is neither the one nor the other.

But Mdle. Croizette's performance is from end to end remarkable for its vigour. Vigour, mental and bodily, is her chief characteristic. Her physical force and nervous energy seem equal to any call that it is within the power of any piece to make upon them. One has heard of actors having baths to restore them after their performances; or remaining prostrate for an hour on the dressing-room sofa. But unless appearances are deceptive, Croizette does not know fatigue. Still it should be remembered that though the piece is long the scenes are short. A brief dramatic passage, and then an exit—no lengthened strain upon the attention and the faculties, until the last

scene of all. In facial expression Mdle. Croizette is rich, but not fertile. Her face can speak plainly, and perhaps only plainly, and without any special abundance of variety; no half thought is told by it, no shifting phase of feeling very subtly revealed. An enthusiast for Desclée has said that there were whole histories in her eyes. But in Croizette's eyes he would be able to read nothing but the news of the moment. Perhaps her special expression is in her gestures, whether marked or slight. You never saw such swiftness of movement still remaining graceful. For *aplomb*, firmness, decision—one may almost say command—she has certainly no rival on the French or English stage. Her voice is neither harsh, on the one hand, nor sympathetic on the other. It is a good voice, fairly modulated, and capable of the expression of overpowering impulse and great self-abandonment. When Henri de Savigny meets Blanche in the park, as Blanche is going to her rendezvous with Lord Astley, and asks her if she knows what it is that she is doing, Mdle. Croizette catches what is precisely the most expressive of accents and intonations, in her brief word of reply, "Je vais me perdre!" She has not yet got some people's power of charging quiet moments with subtle meaning. She can be more boisterous than Fargueil, but not as brilliant—she has nothing of that joyful humour which makes a witty thing seem twice as witty. Nor, of course, is it possible that to her own peculiar qualities she could join the quite opposite qualities of Mdle. Sarah Bernhardt. With the somewhat obstreperous vigour of the one, how join the pensive refinement of the other? With the very quintessence of firmness, how join the gentleness of pathos? And it is just because she is not what others have been and are, that her ability, as it has now developed itself, is to the resources of the Théâtre Français a great and peculiar addition.

Mdle. Sarah Bernhardt's performance of Berthe shows a greater range than she has yet exhibited, and does undoubtedly remove her from the ranks of those who can do one thing perfectly, and nothing else, to the ranks of those, and they are very few, who can do one thing perfectly, and many well. In a word, Mdle. Bernhardt is now a fine *comédienne*. She grasps entirely the part she has to play, and is as much at home in its subdued force and passionate appeal, and in its one moment of radiant satisfaction, as in its tenderness and dreamy regret. Her performance of the scene in which Lord Astley has the audacity to hint to Berthe what are the relations between her husband and her friend, is less remarkable for occasional great merit than for its entire faultlessness. At the beginning of this scene it is so very true to the character, that many, not considering the character, would pronounce it to be tame. Before she knows what Lord Astley has come to talk about, her air is wholly distracted, though polite—why should this man's smooth chatter come in between herself and her sorrow? She listens carelessly. And then, as he goes on, she listens keenly, and then there is a fight in her mind as to what she shall do or say. But he notices nothing, for from head to foot she is still immovable; only the corner of the cushion gets crushed a little in the palm of her hand, and then a dreamy brooding gives place to the mental struggle. She knows the situation now, and has accepted it, and has made no sign that her informant can see. And earlier than that—when she has heard the first avowal of her friend's love for her husband—an avowal accompanied by Blanche's wild cry, that she wishes she were dead, she restrains herself before her husband when he appears, and only when he goes says, with a rush of weariness and sorrow, "Ah! c'est moi, plutôt, qui voudrais mourir!" These things are perfectly appreciated and delicately done, and it is no less to the acting of Mdle. Bernhardt than to the acting of Mdle. Croizette, that the *Sphinx* owes its attractive power for the best theatrical public in the world.

It is often Delaunay's misfortune to play uninteresting characters: feeble characters: men with a wavering disposition to be loveable: men who would be saints if they lived only with Wesleys, but, living with the common world, turn out, much to their genuine regret, to be something entirely different. Sometimes they have a little love-making to do, and then Delaunay does it for them very softly and beseechingly, and as his sentimentality is always triumphant, I take it that his presence is a standing protest against the commonly accepted doctrine that a lover to be successful has need to be audacious. From this point of view the thing may be justifiable—nay, even instructive, if you will—but for my own part I confess myself a little weary of seeing so intelligent an actor in so poor a class of character. One remembers him in *Le Menteur* of Corneille, and wishes him back in it again.

It has been said that certain of the secondary characters are very real, and this is specially true of one of Madame Blanche de Chelles's many admirers—a cousin by marriage, Arthur Lajardie, who lives in mortal fear of all the consequences that would result from provoking Blanche's guardian. He is a guest at the Admiral's house: the Admiral is his uncle; and he likes the Admiral well enough, and likes Blanche, too, but would never have dreamt of marrying her. "Elle est trop dans le mouvement." Lajardie, though appreciative, desires greater repose. Then, too, the young man must needs tell everybody the story of his uncle's prowess. The Admiral's first wife had been false to him, and he had killed her, or rather he would have done so if he had not missed his aim—it all came to the same thing: he had meant to kill her, and had taken the means into his own hands, which one supposes was the best thing he could do just then—nowadays he would have gone to Alexandre Dumas for instruction, but "Tue-la" was then only revenge, and had not become a philosophy. The Admiral himself, played by Maubant, does not suggest the dread with which he inspired his nephew. But even Lajardie, happy in an easy conscience, can at times be at rest from the fear of him, and one of those times is the moment in which we first make his acquaintance. The actor—Journard—enters with his *demi-tasse* in his hand, and sits down on an ottoman, and his tongue is loosened, and he is everybody's friend. "On dine bien, chez mon oncle!" he begins, and he is rather stupid and perfectly content. It is a touch of Nature, better seen than described—this serene fulness of the discreet young man. But it is the acting of M. Journard that gives this individuality: he fills in, very cleverly, where M. Feuillet's outline was slight indeed. Another instance of the way in which careful and finished acting may improve second-rate work, is to be met with in the part of Ulric Dieudonné, an ecstatic musician, said to be a Pole, but more like a German—with thick smooth masses of long hair: hair of the flat and dull light-brown that has no character in it. The ecstatic musician adores Blanche. If she uses him as a messenger to fetch her other admirers, he is enchanted with this commission. If she is weary, he plays her his last *berceuse*, with eyes that are raised to the ceiling when not on the keys of the piano, and so when she goes away his soul is much in his *berceuse*, and not till the end does he look round with utter surprise to find that the portly Admiral is indifferently dozing in her place. Most English low comedians would overdo this part. They would look at the gallery, and would not quite forget the boxes. But Coquelin *cadet* is not ridiculous for the public. He is simply giving life to such material as Feuillet has supplied him with. As for Lord Astley, Febvre represents him with the greatest care and discretion; that is, he unites, very admirably, politeness and good breeding with stiffness, coldness, and reserve; but I do not know that he is quite sure—at all events, he is determined that the public shall not be quite sure—whether Lord Astley is a hard man, radically bad,

or a man under whose coldness there does lie some genuine feeling, however misplaced the feeling may be. The truth is, the character is an enigma, and inasmuch as it is a purposeless enigma, it is one of the several imperfections which make it impossible for the *Sphinx* ever to take high place as work of literary art, however high be the place in popular favour which it may take and keep in France as long as the members of the Comédie Française shall continue to do their best for it.

FREDERICK WEDMORE.

Mdlle. FAVART appeared at the Princess's Theatre on Monday night in M. Octave Feuillet's play, *Le Sphinx*. The drama having been fully reviewed from Paris, it only remains to speak of the performance of the actress, which was not unworthy of her reputation. As portrayed by her, Blanche de Chelles is an evil and a turbulent woman, violent in her passions as Cleopatra, and not less coarse. Even in the first act, while she toys with her lovers, and is seized with moods of feverish gaiety, there is a wild look in her eyes that bodes no good to the dignified moralist, Henri de Savigny, whom she loves. Her struggle to escape from the terrors of *ennui* and from herself, her effrontery when the love-letters fall into the hands of her father-in-law, and the triumphant smile with which she thanks De Savigny for claiming the letters as his own, and so drawing himself into her toils, are depicted by Mdlle. Favart with wonderful power. The Blanche of M. Feuillet might be at heart either a fribble or a courtesan: the Blanche of Mdlle. Favart is wholly the latter. After the unnatural calm of the first act, the storm gathers force in the second. Listening to De Savigny's protestations to his wife with impassive features, but with the glare of a roused wild beast, Blanche resolves to elope with the English nobleman, growing harder every instant as her friend Berthe grows warmer in imploring her to stay, but finally moved to momentary tenderness by the thought of the husband and home she is leaving, and crying with a gesture of supreme misery, "Pauvre créature que je suis!" This was the artist's best scene, and in it her mastery over the emotions of the audience was abundantly manifest. The melodramatic episode in the woods was not rendered in so artistic a spirit; but the moments of despair when Blanche has finally resolved to use the sphinx-ring, and the dull and moody stare with which she mutters that she will not leave the house to avoid exposure, are terrible beyond description. Mdlle. Favart's performance concludes, according to tradition, with imitations of the agony of a poisoned woman—imitations which are no doubt sufficiently death-like, but which are as unnecessary to the play as to histrionic art.

Calypso, an extravaganza by Mr. Alfred Thompson, has been produced at the Court Theatre. Mr. Thompson's fancy is always graceful, but his humorous conceits are less happy. The piece is bright with colour, is enlivened with French songs, and its exponents are for the most part young ladies of prepossessing appearance. But harmony of tints, merry tunes, pretty faces and vignettes are not of themselves sufficient to constitute even a "fantastic idyll."

MR. CHARLES MATHEWS appeared at the Gaiety Theatre on Wednesday night as Mopius in the comedy *Married for Money*, and in the two characters of Puff and Sir Fretful Plagiary in the *Critic*. Mr. Mathews' performance is of the well-seasoned kind that needs no advertisement, especially the advertisement which, in the language of his own part, "delights to draw forth concealed merit with a most disinterested assiduity, and sometimes wears a countenance of smiling censure and tender reproach," and which is known as the "puff oblique."

THE Royalty Theatre will represent this evening a new comedy by Mr. Burnand, adapted from the novel of Mrs. Edwardes called *Archie Lovell*.

THE Alhambra Theatre produces on Monday evening an English version, by Mr. H. J. Byron, of Offenbach's last operetta *La Jolie Parfumeuse*, performed in Paris at the Renaissance Theatre, the version being "considerably altered from the original." The work of MM. Crémieux and Blum will admit of very considerable alteration, being concerned with the adventures during a single evening of a pretty girl who sells perfumeries, and who on the night of her marriage is escorted to her husband's house by one Lacocardière, her husband's uncle. Mdlle. Théo formerly represented the bride, Mdlle. Grivot the bridegroom.

It is said that M. Hervé has composed a "grand lyric drama" on the subject of the Ashantee war, which will be produced at one of the London theatres.

Tabarin, a play by M. Paul Ferrier, is in rehearsal at the Théâtre Français. A comedy in four acts, by MM. Saint-Georges and Jules Sandeau, called *Vaillance*, has been read to the artists of the Vaudeville Theatre. Also, at the same theatre, a play by M. Théodore Barrière has been received, named *Le Chemin de Damas*.

M. GOR appears at the Princess's Theatre on Thursday, May 28, and will act for three nights in Balzac's comedy *Mercadet le Faiseur*, and for three nights in *Le Gendre de M. Poirier*, by MM. Augier and Sandeau.

A VERSION of *Les deux Orphelines*, by Mr. John Oxenford, will be produced at the Olympic Theatre, when Mr. Tom Taylor's play *Clancarty* is withdrawn.

La Belle Paule is the name of a one-act drama, in verse, produced at the Théâtre Français on Tuesday night.

ON Monday evening, Sardou's *Les Ganaches* was revived at the Paris Vaudeville, which has come to depend a good deal upon revivals for its support—it has only produced one very successful piece (we mean M. Sardou's *Rabagas*) during the last three or four years. The cast of *Les Ganaches* is not a very strong one, but it is good enough to keep the piece a little time before the public. The great Vaudeville actress, Mdlle. Fargueil, is not included in it. The second Vaudeville actress, Mdlle. Antonine, is on loan, so to say, at the Odéon. She is playing the Duc d'Anjou, in *La Jeunesse de Louis Quatorze*, which has now attained its hundredth representation, and is still every night filling a theatre which at many seasons is accustomed to be half empty.

THEY have just revived *L'Ami des Femmes* at the Gymnase Theatre. The chief parts are played by M. F. Achard and Mdlle. Pierson, and as it is a typical work of the younger Dumas's, it will probably receive further notice in our columns next week.

Le Pour et le Contre, a witty one-act comedy or proverb, written by M. Octave Feuillet at one of his happiest times, has served this week for *lever de rideau* to his more notable work, *Le Sphinx*. It has but two characters—husband and wife—and these are played very competently on the whole by M. Garraud and Mdlle. Edile Riquier; but at the moment of the *dénouement*, M. Garraud—who has until then performed with much *finesse* and delicate appreciation—appears suddenly to fall short.

Giroflé-Girofla is still played successfully at the Théâtre de l'Alcazar, at Brussels; and special arrangements are made to enable the merchants of Ghent and of Bruges to get back again after a performance in which all Belgium seems to be interested.

At the Théâtre des Galeries Saint Hubert, Brussels, they are playing the three most recent productions of the Palais Royal. Last week there was a benefit performance there for Mdlle. Achille, who retired from the stage that night after a meritorious career of half a century, of which five and twenty years had been given to the Brussels public.

THE little theatre in the park at Brussels—a sort of “Folies Marigny” for the capital of Belgium, as far as its situation is concerned—is still the scene of M^{me}. Chaumont's successes; and on Saturday last that actress appeared there in a new part which within the next few weeks she will probably bring to London.

THE Russian journals announce that a new theatre is to be built at Odessa, which is to give accommodation for from 1,800 to 2,000 spectators, and is to cost from 80,000 to 130,000 roubles. The municipal authorities of Odessa invite home and foreign architects to tender plans and estimates for the intended building by or before November 1 of the present year.

MUSIC.

WAGNER SOCIETY.

THE present series of the concerts of this society was brought to a close on Wednesday evening last, when a programme was brought forward very similar in its general features to those of preceding evenings, but with a sufficient infusion of novelty to excite the interest of even the most regular frequenters of these concerts.

Berlioz's overture to *Benvenuto Cellini*, which opened the performance, has been several times heard at the Crystal Palace. Though by no means one of its composer's best works, it is not without interest, especially in the instrumentation—Berlioz's strong point. Far more attractive musically was the number which followed, “L'Adieu des Bergers à la Sainte Famille,” from the short oratorio, *L'Enfance du Christ*. This movement is a most graceful pastoral chorus, distinguished above most of its composer's works by its great clearness of form and its easy and natural flow of melody. Expression and deep feeling are nearly always to be found in the music of Berlioz; but too often these are accompanied with so much vagueness and obscurity, that the feeling produced is rather an indistinct impression of its power than an absolutely pleasurable emotion. It is not often we meet with so spontaneous a vein of melody as in this little chorus, which, it must be added, was well sung and much applauded. The rest of the programme consisted of selections from Wagner's works. First came the Introduction to the third act of the *Meistersinger*, an exquisite tone-picture which is by this time tolerably familiar to the frequenters of these concerts, and of which we have spoken on previous occasions. It was encored, and on its repetition was given with even more finish and delicacy than the first time. The quintett “Selig wie die Sonne,” from the same opera, was given for the first time; but its performance was hardly so satisfactory as could have been desired, the three (amateur) gentlemen who took part in it being altogether overweighted by the powerful voice and forcible delivery of M^{me}. Otto-Alvsleben, who took the part of Eva; the gentlemen, moreover, sang their by no means easy parts with a certain hesitancy betokening want of familiarity with the music. The splendid *entr'acte* from *Lohengrin*, another old favourite at these concerts, was excellently played, and obtained an irresistible encore. The charming bridal chorus from the same work succeeded, and was also well given. The same may be said of Elsa's speech to Ortrud, “Du ärmste kannst wohl nie erlassen,” a lovely melody, less suited, however, than many other pieces for separation from its context. The “Spinning-wheel Chorus,” from *Der Fliegende Holländer*, seems to be peculiarly unfortunate at these concerts. On a previous occasion its effect was marred by a false start in the voices; and though no such *contretemps* occurred on Wednesday, it was given in a spiritless, undecided manner, which failed to make the impression which the charming music deserved. We regret also that we must speak unfavourably of the rendering of the following piece—the mag-

nificent prelude to *Tristan und Isolde*. The opening passages lost much of their effect by being played by only two violoncellos, instead of the whole mass, as indicated by Wagner; and it is difficult to understand why Mr. Dannreuther should have made the alteration. But a more serious mishap arose from the fact that the gentleman who was playing the *coro inglese* (one of our best orchestral players, by the way, whose name we forbear mentioning) lost himself completely at the very beginning of the piece; not one single note of the important part given to that instrument could we hear through the whole of the prelude—the result in places being simply disastrous. On the other hand, the finale of the same work was splendidly given. Madame Otto-Alvsleben declaimed the very exacting solo part with great dramatic force, and was admirably supported by the orchestra, through which in Wagner's wonderful music the waves of passion seem to roll like the long swell of the Atlantic. The brilliant “Kaisermarsch” brought the concert to a close.

In looking back upon the series now concluded, the warmest thanks of musicians must be offered to Mr. Dannreuther for the opportunities afforded of hearing so much new music as has been given at these concerts. It is quite true, as we have previously had occasion to remark, that it is impossible to judge of Wagner from any isolated fragments of his works; but, on the principle that “half a loaf is better than no bread,” we may be thankful for even an imperfect acquaintance with him, as it is certainly preparing our concert-goers for the reception of his works, when the time shall come, as it surely will sooner or later, for their production on the stage. We trust that the success of the past series of concerts will ensure their continuance next winter.

EBENEZER PROUT.

MR. RIDLEY PRENTICE, whose efforts to popularise good music in the south of London, by his excellent monthly Popular Concerts at Brixton, deserve every recognition, gave a piano recital on Wednesday at St. George's Hall. The programme comprised Bach's Prelude and Fugue in B minor, transcribed by Liszt, Beethoven's Sonata in E flat (Op. 31, No. 3), a selection from Mendelssohn's *Lieder ohne Worte*, Bennett's Three Sketches, “The Lake, the Millstream, and the Fountain,” and smaller pieces by Weber, Chopin, and the concert-giver.

THE death is announced, at Milan, of Signor Mongini, the well-known *tenore robusto*. Possessed of a magnificent voice, he was at the same time one of the most uncertain of singers. Nothing could be finer than such performances as his Arnold in *Guillaume Tell*, or Raoul in the *Huguenots*, on one of his “good” nights; but there were other, and not unfrequent, occasions when he was most unsatisfactory. His death creates a vacancy on the operatic stage which will not be easily filled.

WE have also to mention this week the death of Amédée Méreaux, a distinguished French musician, at Rouen. Besides being a voluminous writer for the piano, Méreaux edited a collection of the works of writers for the clavecin from 1639 to 1790, arranged in chronological order.

AT a concert recently given at Berlin, Frau Joachim, the wife of the great violinist, and one of the first living contralto singers, revived a Church-Cantata by Sebastian Bach, *Geist und Seele wird verwirret*, for alto solo with orchestra and organ obbligato. The example is one which deserves to be followed; for there are many of these fine works which are quite worthy of performance.

WE are glad to learn from the German musical papers that Dr. von Bülow has so far recovered from his recent illness as to be able to travel. He recently passed through Leipzig on his way from

Russia to Italy, where he intends for the sake of his health to remain some months, especially at Milan and Florence.

A NEW “Singspiel” (play with music), entitled *Die Monkgüter*, composed by Robert Radecke, the conductor of the Royal Opera House at Berlin, has been produced on that stage with good success.

THE one-act opera *Gille et Gillotin*, a youthful production of Ambroise Thomas, the well-known composer of *Mignon* and *Hamlet*, was produced for the first time, on April 22, at the Opéra Comique, at Paris. The composer protested to the last against the production, but no choice was left to the directors, as they were compelled by legal proceedings taken by the librettist, Th. Sauvage, to bring it out. The pleasing, if not very original, work was received by a well-filled house with demonstrative applause, as if to show the composer that he was wrong in objecting to its performance.

THE young Neapolitan pianist, Alfonso Rendano, who, it will be remembered, was heard in London last season, has lately been giving concerts with great success in Rome.

MADAME ERARD, the widow of the great pianoforte maker, has presented two magnificent grand pianos to the Conservatoire at Lyons.

FROM the *Signale* we learn that the real author of the libretto of Verdi's last opera, *Aida*, is not Antonio Ghislanzoni, as officially announced, but the Viceroy of Egypt himself. After the Khedive's European tour in 1867, he had already laid out the plot and sketched the text, when he desired Verdi to write the music to an opera the scene of which was to be laid in Ancient Egypt. The sketch of the Khedive was then given to Signor Ghislanzoni, who from the groundwork thus supplied to him filled in the details. The arrangement of the scenes, it is said, is for the most part the work of the Viceroy himself.

THE Riedelsche Verein, at Leipzig—a society for the performance of large choral works, conducted by Carl Riedel—will celebrate to-morrow the twentieth anniversary of its foundation by a performance of Bach's great Mass in B minor in the Thomaskirche.

THE last number of the *Musikalisches Wochenblatt* gives a detailed account of a recent performance at Düsseldorf of Beethoven's Pastoral Symphony, with pictorial and pantomimic illustrations. The experiment has, we believe, been tried before, but, naturally enough, without success. While speaking favourably of the illustrations themselves, the writer clearly points out that such an attempt to combine music with the imitative arts is an artistic mistake, and must result in failure.

THE Berlin *Börsencourier* says that the opening of a bazaar under aristocratic patronage, in aid of Wagner's Bayreuth undertaking, has been postponed to the autumn of this year, in consequence of many artists who take an active interest in it having promised to contribute pictures which cannot be ready earlier.

It is stated that Liszt intends to pass the coming summer at Rome, and will occupy himself with the composition of a new oratorio, *Der Heilige Stanislaus*.

THE Musical Festival at Zurich, mentioned in our notes of May 2, is fixed for July 11 to 14. Among the works to be performed are Handel's *Joshua*, Beethoven's Choral Symphony, Schumann's *Faust* and his B flat symphony, Brahms's “Triumphlied,” and the prize cantata composed for the occasion by Rauchenecker.

WE learn that M^{me}. Adelina Patti is going to give a concert in London for the benefit of the “Mozarteum” at Salzburg, at the request of Dr. Oscar Berggrün, treasurer of the Vienna branch of the Salzburg Mozarteum.

POSTSCRIPT.

DR. ASHER, of Leipzig, writes to us to correct a reference to a passage of Schopenhauer in a recent article on Lord Lytton's *Fables in Song*. "Virtue," says the philosopher, "awaits its reward in the next world; Ability hopes for it in this; Genius, as being its own reward, in neither." Our reviewer had inadvertently quoted the first part of the passage, "Virtue has its reward in the next world," which involves a more definite belief in individual immortality than Schopenhauer would appear to have entertained, although, as Dr. Asher points out, he speaks in the *Parerga*, i. p. 505 (collected edition), of a future world where sin shall meet its punishment.

We are glad to find that Dr. Alexander Schmidt has followed our suggestion to change the proposed title of his forthcoming book, *The English of Shakespeare*, to that which the book really is, a *Shakespeare-Lexicon*. A complete Dictionary of all the English Words, Phrases, and Constructions in the Works of the Poet. Volume I., A-L, will be published soon, in imperial octavo, at a moderate price, and Messrs. Williams and Norgate are now circulating prospectuses, soliciting subscriptions for the book.

THE Working Women's College, which has been steadily doing good work at 29 Queen's Square, Bloomsbury, since 1864, when it was founded by the Messrs. Malleon and their friends, is next October to be thrown open for the joint education of men and women. This joint education has always been the aim of Messrs. Malleon, and after ten years' trial of the sole system, they are more than ever convinced of the need of the joint one. Some of the less liberal of their old supporters have, we hear, seceded from the old council, and resolved to open a new College for women alone in another quarter. The two institutions may well exist together; and the new sole College may but prepare the way for another joint one, after its own first ten years of life. Meanwhile, more women will be helped in their studies and friendships, and so the present steps are every way a gain.

HODDER & STOUGHTON'S PUBLICATIONS.

Completion of Dr. Stoughton's Ecclesiastical History.

Now ready, in 8vo, price 12s.

THE CHURCH OF THE REVOLUTION.

By JOHN STOUGHTON, D.D.

The preceding Volumes may also be had as follows:—

THE CHURCH OF THE CIVIL WARS AND THE COMMONWEALTH.

2 vols. 8vo, 28s.

THE CHURCH OF THE RESTORATION.

2 vols. 8vo, 28s.

"A remarkably fair, charitable, large-minded, and honestly written history."—*Guardian*.

IMPORTANT NEW WORK BY DR. VAN OOSTERZEE. Now ready, in 1 large Volume, royal 8vo, pp. 840, price 21s. handsomely bound in cloth. CHRISTIAN DOGMATICS: a Text-Book for Academic Instruction and Private Study. By J. J. VAN OOSTERZEE, D.D., Professor of Theology in the University of Utrecht. Author of "The Theology of the New Testament." Translated by the Rev. J. WATSON WATSON, B.A., Vicar of Newburgh, Lancashire, and Rev. MAURICE J. EVANS, B.A., Stratford-upon-Avon.

NEW WORK BY THE AUTHOR OF "THE PURGATORY OF SUICIDES."

This day, in 1 vol. crown 8vo, price 6s.

OLD-FASHIONED STORIES. By Thomas COOPER. Author of "The Purgatory of Suicides," "The Paradise of Martyrs," "The Baron's Yule Feast," "Alderman Ralph," "The Family Feud," "The Bridge of History," &c.

THE REVOLT OF THE FIELD: a Sketch of

The Rise and Progress of the Movement among the Agricultural Labourers. With a Reprint of the Correspondence to the *Daily News* during a Tour through Canada with Mr. Arch. By ARTHUR CLAYDEN. Crown 8vo, 3s. 6d.

"A very interesting account. . . Both graphic and full of information."—*Examiner*. "Abounds in excellent suggestions."—*Standard*. "The book is admirable, both in matter and manner."—*Observer*. "A very full and interesting sketch."—*Daily News*. "Curiously full of interest and instruction."—*Echo*.

THE EAST AFRICAN SLAVE TRADE.—SEE MR. NEW'S LIFE, WANDERINGS, and LABOURS IN

EASTERN AFRICA. A Second Edition of which is now ready price 10s. 6d. With Map, Portrait of the Author, and Illustrations.

"The book is one of sterling value and great interest."—*British Quarterly Review*. "We can cordially recommend the book to all persons interested in Africa and the Africans."—*Examiner*.

This day, a New and Cheaper Edition of

The LIFE OF the Rev. ALFRED COOKMAN, of the Methodist Episcopal Church of America: with an Account of his Father, the Rev. G. G. COOKMAN. By the Rev. H. B. RIDGWAY, D.D. With an Introduction by Rev. W. MORLEY PUNSHON, LL.D., and Fine Portrait. Crown 8vo, cloth, 5s.

Just published, crown 8vo, price 2s. 6d.

PROTESTANTISM: its Ultimate Principle. By R. W. DALE, M.A., Birmingham.

Just ready, crown 8vo, price 3s. 6d.

DISPUTED QUESTIONS OF BELIEF.

Being Lectures to Young Men, delivered at the English Presbyterian College. Edited by the Rev. OSWALD DYKES, D.D.

At NIGHTFALL and MIDNIGHT:

Musings after Dark. By FRANCIS JACOB, B.A., Author of "Aspects of Authorship," &c. Crown 8vo, cloth, 3s. 6d.

"Those who are fond of choice extracts and curious anecdotes, will find an almost boundless treasury in a book called 'At Nightfall and Midnight.' They are woven together by the artist's skill into one continuous web, so that the effect produced is very much that of listening to a conversation, or rather to a monologue, of a lively stored mind pouring out its wealth in a strong flowing and spontaneous stream."—*Guardian*.

NEW COMMENTARY.—Now publishing, A POPULAR COMMENTARY on the NEW TESTAMENT. By D. D. WHEDON, D.D., LL.D., of the Methodist Episcopal Church, U.S. Vol. I. is now ready, containing Matthew and Mark, comprising the Text, with Marginal References, copious Explanatory Notes, and numerous Plans and Engravings; forming a handy volume of 422 pages, crown 8vo, price 6s. handsomely bound in cloth. To be completed in Five Volumes.

"The chief features which have most commended themselves to our admiration are the concise and helpful introduction, the historical synopsis of the Gospels, the excellent maps and illustrations, and the remarkable terseness and fullness of information, at once apt and accurate, which characterizes the annotations. . . . It is an excellent Commentary, which we feel it a duty to recommend."—*Standard*.

London: HODDER & STOUGHTON, 27 and 31, Paternoster-row.

EVERY SATURDAY, and to be had, by Order of all Booksellers and Newsmen.

PRICE FOURPENCE.

THE

A C A D E M Y

A WEEKLY REVIEW OF

LITERATURE, SCIENCE, ART, MUSIC, AND THE STAGE,

Will contain:

REVIEWS and NOTICES of all important New Books, English and Foreign.

REPORTS of TRAVEL, EXPLORING EXPEDITIONS, &c.

ENGLISH LANGUAGE, ANTIQUITIES and FOLKLORE.

NEWS LETTERS from Foreign Countries.

CORRESPONDENCE between Literary Men.

PUBLISHERS' ANNOUNCEMENTS.

NOTES on the PROGRESS of SCIENTIFIC DISCOVERY in all branches.

CRITICISMS of the PICTURE GALLERIES, of the STAGE, and of MUSIC.

OPINIONS OF THE PRESS.

"The ACADEMY may fairly claim the first place among literary journals as the representative of the ripest and soundest English scholarship; and its criticisms of art, literature, music, and the drama are informing, incisive, and trustworthy. . . . It is hardly possible in a few words to give an idea of the excellence of this old journal in its new form, but every subject with which it deals (and it deals with many untouched by other papers) is entrusted to the hands of men who know what they are writing about, and the result is a freshness and fulness of information and an accuracy of judgment which commands confidence, and ministers to the intellectual satisfaction and pleasure of the reader. . . . The accomplished and scholarly dramatic critic of the ACADEMY, Mr. Frederick Wedmore, the novelist, whose theatrical notices are perhaps the best in style and the most trustworthy now appearing in any London journal."—*Manchester City News*.

"Our contemporary the ACADEMY has suddenly sprung into a great literary position, and is full of instructive and interesting matter."—*Spectator*.

"The ACADEMY, in its new and enlarged form, has a promising look. Its size is that of the *Athenaeum*, and the general arrangement of its contents does not differ much from that of its venerable and not too enterprising contemporary. The great distinction between the two is that the articles of the ACADEMY are signed. . . . It will be seen that there is no lack of strong names. But strong names will not of themselves float a new paper. The editing, the general tone, the make-up of it are more important, and of these too a good report can be given. . . . Altogether, the ACADEMY is very readable, and bids fair to be a formidable rival to the *Athenaeum*, which, for that matter, it might speedily and easily surpass in certain respects."—*New York Tribune*.

"We can confidently recommend the ACADEMY to our readers. Its price is fourpence, and all its papers and reviews are signed by their writers, whose names have a high position in literature and art."—*London Figaro*.

THE ACADEMY will pursue the purely practical aim of being a guide and source of information to all educated persons.

PUBLISHED BY

WM. GREIG SMITH, 43 Wellington Street, Strand.

BICKERS & SON'S LIST

NEW BOOKS AND NEW EDITIONS.

Just published, Fourth Edition, enlarged to 1,000 pages, with most important Additions, royal 8vo, cloth, 42s.

MARKS and MONOGRAMS on POTTERY and PORCELAIN. With Historical Notices of each Manufactory. By WILLIAM CHAFFERS, Author of "The Ceramic Gallery," "Hall Marks on Plate," &c. Fourth Edition, containing a vast amount of additional information on the Foreign Potteries, and a general Revision of the Work, as well as important Historical Accounts of the principal Potteries of Europe and Asia, from the Earliest Times to the Present. The Staffordshire and other English Manufactories have been more fully described; and in connexion with the subject generally, the Author's aim has been to ascertain correctly Facts, Names, and Dates. The number of Pottery Marks and Illustrations are in this Edition increased to 3,000, many of which are hitherto unpublished.

In a few days.

1 vol. crown 8vo, limp cloth, 6s. post free.

THE COLLECTOR'S HANDBOOK of MARKS and MONOGRAMS on POTTERY and PORCELAIN of the RENAISSANCE and MODERN PERIODS. Selected from the above Work. By WILLIAM CHAFFERS.

* * * This will form a most complete and comprehensive Guide to the knowledge of all the varieties of the Ceramic Art, a veritable *mutuum in parvo*.

Ready this day, 2 vols. royal 8vo, elegantly bound in cloth, gilt sides and gilt edges, 2l. 2s.

"THE BOYDELL SHAKESPEARE."—COWDEN CLARKE'S EDITION of SHAKESPEARE, complete, with Life and Glossary. Illustrated with 67 Pictures, selected from the "Boydell Gallery," Reproduced in permanent Photographs from the Original Copper-plate Engravings after Reynolds, Fuseli, Northcote, Ope, Stothard, &c.

* * * The success which attended the reproduction of the famous "Boydell Gallery" has induced the Publishers to select the choicest gems from that Work for the purpose of illustrating their handsome edition of Shakespeare, thereby supplying a want long felt for a handsome illustrated copy of our national poet at a moderate price.

Demy 8vo, wrapper, 1s.; cloth, 1s. 6d. post free.

A COMPLETE JURIES' BILL. With Notes by T. W. ERLE, Associate, Court of Common Pleas. Published by permission of Lord Coleridge, for whom, when Attorney-General, the Bill was prepared.

BICKERS & SON, 1 Leicester Square, W.C.

The HISTORY of ENGLAND from 1830 to 1874. By the Rev. WILLIAM NASSAU MOLESWORTH. Cheap Edition, in 3 vols. crown 8vo. Vol. II. price 6s. [This day.]

THOMAS CARLYLE'S WORKS. New Volume of People's Edition. **TRANSLATIONS from the GERMAN.** Vol. I. Crown 8vo, 2s.

The SEVEN AGES of a VILLAGE PAUPER. By G. C. T. BARTLEY, Author of "One Square Mile in the East End of London." Crown 8vo, price 5s.

Will be published immediately.

The CAUSE of the SO-CALLED PROPER MOTION of the FIXED STARS. With a Suggestion for a New Standard Measure of Time. By Lieutenant-Colonel DRAYSON, R.A., F.R.A.S.

CHAPMAN & HALL, 193 PICCADILLY.

Just published, crown 8vo, cloth, 5s.

THE FUTURE of INDIA—WATERWAYS or RAILWAYS; or, THE FUTURE of INDIA. What are we to do with the Hundred Millions? By Lieut.-Col. F. TYRRELL, M.R., J.A., Author of "Public Works," "Reform in India," &c.

Also, by the same Author,

THE ROYAL VICEROY. Price 1s. London: EDWARD STANFORD, 6, 7, and 8 Charing Cross.

Now ready, price Five Shillings.

ALGEBRA IDENTIFIED WITH GEOMETRY in Five Tracts:—1. Euclid's Conception of Ratio and Proportion.—2. "Carnot's Principle" for Limits.—3. Laws of Tensors, or the Algebra of Proportion.—4. Laws of Clinants, or the Algebra of Similar Triangles Lying on the Same Plane.—5. Stigmatic Geometry, or the Correspondence of Points in a Plane;—with one photolithographed Table of Figures. By ALEXANDER J. ELLIS, F.R.S., F.S.A.

C. F. HODGSON & SONS, 1 Gough Square, Fleet Street, E.C.

NEW BOOKS.

This day, in crown 8vo, price 6s.

The SONGS and BALLADS of SCOTLAND

in view of their INFLUENCE on the CHARACTER of the PEOPLE. By J. CLARK MURRAY, LL.D., Professor of Mental and Moral Philosophy in McGill College, Montreal.

RENDU'S THEORY of the GLACIERS of SAVOY.

Translated by ALFRED WILLS, Q.C., late President of the Alpine Club. To which are added the Original Memoir, and supplementary Articles by Professors TAIT and RUSKIN. Edited with Introductory Remarks by GEORGE FORBES, B.A., Professor of Natural Philosophy in the Andersonian University, Glasgow. 8vo, 7s. 6d. [This day.]

HORÆ HELLENICÆ. Essays and Discussions on some important Points of Greek Philology and Antiquity.

By JOHN STUART BLACKIE, F.R.S.E., Professor of Greek in the University of Edinburgh. 8vo, 12s. [Next week.]

ESSAYS and ADDRESSES by Professors and LECTURERS of OWENS COLLEGE, MANCHESTER.

Published in Commemoration of the Opening of the New College Buildings, October 7, 1873. 8vo, 14s. [Next week.]

WORTHIES of ALL SOULS: Four Centuries of English History illustrated from the College Archives.

By MONTAGU BURROWS, Chichele Professor of Modern History, Fellow of All Souls. 8vo, 14s. [This day.]

"A most amusing as well as a most instructive book. While it throws a flood of light, which the historical student will eagerly welcome, on some obscure passages and some famous personages, it is at the same time so lightly and smoothly written, that the general reader, if he once takes it up, will not find it easy to lay it down till he has finished it."—*Guardian*.

The APOSTOLICAL FATHERS: A Critical Account of their Genuine Writings and of their Doctrines.

By JAMES DONALDSON, LL.D. Crown 8vo, 7s. 6d. [This day.]

WILLIAM CARSTARES: a Character and Career of the Revolutionary Epoch (1649-1715).

By ROBERT H. STORY, Minister of Rosneath. With Portrait engraved by Joens. 8vo, 12s.

The ODES of HORACE in a METRICAL PARAPHRASE.

By R. M. HOVENDEN, B.A. Extra fcap. 8vo, 4s. 6d. [This day.]

ETRUSCAN RESEARCHES. By Isaac

TAYLOR, M.A. With Woodcuts. 8vo, 14s.

The *Times* says: "The learning and industry displayed in this volume deserve the most cordial recognition. The ultimate verdict of science we shall not attempt to anticipate; but we can safely say this, that it is a learned book, which the unlearned can enjoy, and that in the descriptions of the tomb-builders, as well as in the marvellous coincidences and unexpected analogies brought together by the author, readers of every grade may take delight as well as philosophers and scholars."

The PRINCIPLES of SCIENCE. By Professor

JEVONS, F.R.S. A Treatise on Logic and Scientific Method. 2 vols. 8vo, 25s.

"While disposed to be critical over some twenty or thirty pages of these two volumes, we feel bound to express our sense of the very great merits of the whole work. The chapters dealing with the quantitative developments of logic are of the highest value, and appear to constitute a real advance in logical science." *British Quarterly Review*.

MACMILLAN AND CO., LONDON.

TRÜBNER & CO.'S NEW PUBLICATIONS.

NOTICE.—The SECOND EDITION of Mr. GEORGE HENRY LEWES'S *PROBLEMS of LIFE and MIND, First Series, "The Foundations of a Creed," Vol. I., will be ready at all Booksellers and Libraries early next week.*

ON BEER. A Statistical Sketch. By M. VOGEL. Fcap. 8vo, pp. 88, cloth limp, 2s.

London: TRÜBNER & Co., 57 and 59 Ludgate Hill.

SATURDAY, MAY 23, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

AN UNPUBLISHED MEMOIR BY RICHELIEU.

"Si l'on veut ignorer Richelieu," says M. Michelet, "il faut lire ses Mémoires." And the reason is not hard to find for anyone who begins to compare any portion of the famous Memoirs with contemporary documents. Other statesmen have been anxious to show that the course which they had recommended was a wise one, and have taken pleasure in tracing failure to the rejection of advice which they had given. Richelieu cared more to establish a reputation for power than a reputation for wisdom. Whatever had been done must be shown to have proceeded from himself. Advice which had been set aside, or which had from any reason failed of success, however excellent it may have been, must be buried in silence.

Such a system is absolutely fatal to the true history of the earlier part of his ministry, when he was combating hostile influences at Court, which had a considerable hold upon the King's mind. It is therefore worth while to bring out the true Richelieu, whenever it is possible to do so, from under the concealment which he has so carefully woven with his own pen.

At the beginning of 1625 it is well known that Richelieu was urging the King to assist the enemies of Spain, if not to declare open war against that country. With that view he had given his approbation to the negotiations for the marriage between the future Charles I. and Henrietta Maria. But a sudden outbreak of the Huguenot leader Soubise, and the support given to him by the great seaport town of Rochelle, made it an anxious consideration with the French government, whether it was possible at the same time to resist Spain and to suppress the Huguenots. Richelieu, in his Memoirs, copies a long memoir which has since been printed by M. Avenel (*Lettres de Richelieu*, ii. 77), and which has been assigned by him to the beginning of May, 1625. In this paper Richelieu asserts the impossibility of fighting Spain and the Huguenots at once, and concludes for making peace with Spain and suppressing the Huguenots, though the conclusion is come to in a somewhat hesitating way.

In July, however, deputies arrived from the Huguenots to treat for peace. They asked that their leaders might be taken into the King's service, and that the Treaty of Montpellier, made in 1622, and shamefully violated ever since, might be better observed in future. By this treaty, amongst other things, Lewis XIII. had promised to raze Fort Louis, which he had built to command the entrance of the harbour of Rochelle, and which in spite of that promise had remained intact. In his Memoirs (ii. 439), Richelieu gives the following account of what took place:—

"Sa Majesté leur accorda la plupart de ce qu'ils demandaient, mais demeura ferme sur le refus du rasement du Fort-Louis, le Cardinal y insistant absolument, bien que le Duc de Guise fût ouvertement d'opinion contraire."

He then gives the substance of his argument, which is printed entire by M. Avenel, from a MS. probably in the Cardinal's hand, and which is to the effect, that though the Huguenot leaders Rohan and Soubise might be taken into the King's employment (*Avenel*, ii. 48):—

"Sa Majesté ne peut maintenant ny razer le fort, ny le permettre, ou en donner esperance pour sa reputation; tant à cause qu'il sembleroit qu'on extorqueroit par force cet avantage, qui doit estre reconnu de la pure bonté du Roy, que parce aussy que ceux qui en recevroient le fruit en sauroient le gré aux sieurs de Soubise et Rohan, qui par ce moyen feroient réussir les prétensions qu'ils ont toujours eues de se rendre chefs de party."

Some vague promise might be given of doing something for them in future. But that was all.

It will be observed that Richelieu places this memoir in July. M. Avenel, however, places it in the middle of June, and the want of all reference to any proposal actually made by the Deputies makes it extremely probable that he is right in so dating it.

I have now to call attention to the paper, of which I subjoin a translation.

I found it some years ago among the State Papers (*France*) at the Record Office, and was at once struck by its style. There is nothing on the paper itself to indicate the author, as it is simply indorsed "Discours sur les affaires fait à Fontainebleau." But I do not believe that any man except Richelieu was capable of writing it. I have since been informed that a copy has been discovered by M. Avenel in France since the publication of his great collection, in a handwriting similar to that of other MSS. of the Cardinal. But even if this be not the case, the internal evidence will, I think, be sufficient for most readers.

The paper is placed in the bundle with other papers of January, 1626, which is plainly a mistake. Its true date must have been, I suspect, just before the first audience of the Deputies, which took place on July 5:—

"Discourse upon present Affairs made at Fontainebleau.

"The King being obliged by all considerations of State to remain armed, as well to prevent the perilous aggrandisement of the domination of Spain which is irritated against France, as to dissipate the evil designs of the restless spirits who would embroil his kingdom, it may be said [*on peut dire*] that it is more fit for the King to employ his arms advantageously for his glory than to use them for the desolation of his states, the ruin of his subjects, and the confusion of his affairs.

"This is why, without losing much time by resolutions upon advices as they come in [*sur divers avis*], it seems that it is necessary that his Majesty resolve promptly upon three important points; to wit, either to make war against the Huguenots and the factions persons of his kingdom, or to continue war in Italy, or to carry entirely his arms into Germany, as much for the protection of his allies as to prevent those countries from falling absolutely under the entire domination of the House of Austria—the importance of each of the aforesaid points being of such consequence that they well deserve to be considered apart in order to render apparent the evil or the good

which may result therefrom. Beginning with the first, some will find that the faction of the Huguenots is intolerable, that differences of religion are dangerous in a State, that the advantage that the King has over them is very great, and, therefore, that his Majesty ought not to lose the opportunity of putting an end to and exterminating heresy. Towards this end minds of many orders are inclined, some by zeal, some by passion, some by faction, and many by ignorance. The wishes of the wise are also strongly inclined in the same direction. But the knowledge they have of the present juncture of affairs makes them moderate their desires from apprehension of the inconveniences which may arise from a design undertaken at an inopportune time, and in which so many kinds of factions may meet, capable of preventing the gathering of the fruits which his Majesty and all honest men would expect from so glorious an enterprise.

"Leaving, then, aside all consideration of the divers interests which many have to foment civil war in the kingdom, and to keep it there as long as they are able, it may be said that civil war comprises in itself so many kinds of inconvenience, and draws after it so many shameful miseries, that everyone of sound judgment will say with the proverb: 'It is better sometimes to leave your child's nose dirty than to cut it off.' So may it be said that it is better still to tolerate for some time the disobedience of the Protestants, and maintain peace with them, than to risk everything in the thought of hastening their ruin. So that whosoever will balance the utility that his Majesty may get out of an intestine war out of season, will find as a counterpoise an infinity of perilous accidents and very few assured profits, wherefore he will conclude that the King cannot but lose in all ways, and that our neighbours only would doubly profit therefrom.

"The pretext of Religion by means of which since the death of the late King, both Catholics and Protestants have been instigated to mutual annoyance, ought to be well considered before taking up arms once again to cut one another's throats upon this subject; this specious veil having always been put by foreigners before the eyes of Frenchmen rather to ruin them than to save them. This malice, moreover, being enveloped with so many cabals by reason, as it is said, of the divers interests of the great ones who foment them, it is sufficient to give a general notice of them rather than by entering into particulars to mention individual names.

"When the King and his Council consider the first motives of the troubles of the years 1621 and 1622, his Majesty will find that they proceeded from the foreigners' shop [*la boutique des étrangers*] at the same time that they usurped the Valtelline, invaded Germany, and put an end to the Truce of Holland. Also when the King shall wish to compare the profits that he obtained from this war with those of his neighbours, his Majesty will remark that the war desolated some of his own provinces, while the Spaniard conquered those which did not belong to him, and that the King has been compelled to burn entire cities, which are no more, while Spain has made conquest of several places of consequence which she still keeps; and that the effort of these foreigners to prolong the war in France is with no other design than to provide means to our enemies to finish what they have begun, and by ruining us at home to ruin also the reputation and the arms of the King abroad, in order that they may be able to cause all the forces of their new Monarchy to fall upon France after it has been weakened. And therefore we must conclude that his Majesty could not undertake at this season any war within his states which would be advantageous to him, nor make any peace with the Huguenots which should be disadvantageous, inasmuch as war makes them their own masters in rebellion, but peace retains them always to some extent

in obedience. So that if there are some who think that there is less shame in making concessions after having tried what war can do and when affairs are reduced to that miserable state which is often the result of the misfortunes of war, they may be told that there is more honour in granting these concessions by foresight, and in avoiding the miseries of a troublous time, than in refusing to yield till the State has been ruined and the blood of Frenchmen has been shed, as experience has shown us in the reigns of Henry II., Francis II., Charles IX. and Henry III. These apprenticeships have cost France so dear, that they ought to make us more circumspect in the management of the public peace.

"Peace then being absolutely necessary as much for his Majesty as for his State, we have still to consider the means of making it honourable and advantageous to the King. And although the thing seems difficult to some, it will be found nevertheless that nothing is easier, since it is in the King's hands, provided only that each one contributes out of his means to the completion of so good a work. For it is not more disgraceful or irreligious for the King of France to raze the fort of Rochelle, and to make peace with his subjects, than for the Emperor to have given up several villages to the Turk in order to come to terms with him, so that his arms might be the more easily employed in the designs that the House of Austria has in Germany.

"Nobody calls in question that the Huguenots owe obedience to his Majesty, and that the King owes to them his protection by his Edicts. It is necessary that they render duty to him to whom they are under obligation, and that his Majesty keep his word in that he has promised and will promise them. That being so, it is easy to allay the existing differences, provided that all designs to provoke and harass those of the Religion come to an end. Otherwise we should always have to begin over again, there being nothing more certain than that defiance is natural to those who are being continually informed that there is a wish to ruin them. In granting them royal security and in leaving their conversion to God, it cannot be doubted but that they will be brought back with kindness to the Palace, and in time to the Altar [*qu'on ne les ramène charitablement à l'hôtel, et avec le temps à l'autel*], and that the King will find as great fidelity among them as among the Catholics. Those who come to the conclusion that the honour of the King is at stake, if he agree to the supplications of the Huguenots, ought also to consider that the reputation of his Majesty, and the good of his service, is much more at stake if he abandons the protection of his Allies and his arms which are engaged in the Valtelline and in Italy, and that this cannot be done except to the detriment of his reputation, and even of his Crown. Posterity itself would be able to tax the Council with having in a cowardly way abandoned our external affairs to undertake frantically and out of season a civil war which is desired by our enemies, rather than consent to the demolition of four sorry bastions which his Majesty might easily reconstruct at all times, and whensoever he pleases.

"It may also be answered to those who say that it would be a reproach to the greatness of the King to direct the razing of the fort of Rochelle for the advancement of his affairs, that, as will clearly be seen after the event, there will be much greater laughter among foreigners if we sacrifice our State and our Allies to Spanish greatness, by turning our arms against our own fellow-citizens, who only ask for peace and liberty of conscience.

"To make peace with the Spaniards, as some propose, so as to turn all the forces of the King against the Huguenots, is again to fall back into the same inconveniences as before; and in effect to abandon external affairs to the discretion of the enemies of this state, and even to give them cause to laugh at us, with reason for our want of foresight. By which means we shall leave them

the power of establishing themselves everywhere without resistance, and more convenience to assist underhand the rebels of the kingdom, whom it must not be doubted they protect in accordance with maxims of state, and principally in this season when they believe themselves to have received from France an offence which they will never forgive. Wherefore the King imposing peace at home will be able to make use of all his subjects by employing them usefully abroad against the designs of the inveterate enemies of his Crown.

"That which seems the most difficult in all this is the form of treating of peace with the Huguenots, it being certain that a Prince ought to avoid treating with his subjects as much as he can. Therefore the best expedient would be not to listen to deputies for treating of any thing with them, but that they throw themselves publicly at the feet of his Majesty, supplicating him very humbly to receive them into his good favour, and to be willing to give them peace in general terms, without speaking of any particularity therein. After which it would be proper that the King should himself advise in his council how to terminate the affair in such a way, that discontent ceasing, peace might promptly spring out of it, there being no higher aim for a sovereign than by his prudence to cut up the roots of the troubles of his state, it being sometimes more expedient to tolerate an evil than to risk making it greater by opposing it too obstinately.

"Rochelle demands the demolition of the Fort, according to the Treaty of Montpellier; the Duke de Rohan, some money which has been promised to him and the Sieur de Soubise to pass the Straits [of Gibraltar] for the service of the King, in the vessels which he has taken. We must now consider whether it is not better worth while to raze the fort of St. Louis in order to have peace, to content the Duke of Rohan in order to avoid greater expenses, and to employ the said Sieur de Soubise in the wars in Italy, than to have the shame of not taking Genoa for want of assistance by sea, and to embark ourselves in ruining the provinces of this kingdom because we refuse to make the said payment. No right-minded person can gainsay this, inasmuch as, the honour of the King being safe without, his Majesty will always be able to chastise the Dukes of Rohan and Soubise if they do not fulfil their duty; and to rebuild new forts at Rochelle if that town turns rebel to her prince. If, however, the King engages in a civil war, he can assure himself that from that time his affairs will go very badly, within as well as without; and that his conduct will give rise to so many factions in his State that it is to be feared they will be worse than those of the League of the time of Henry III.

"There is yet another very important consideration, which is, that from the moment that our allies shall see France embarked in a war of religion, they will infer that they will not be able to expect any further assistance from France, and will seek the means of coming to an agreement with Spain. This will especially be the case with the King of England, who is interested in the recovery of the Palatinate, and will possibly be the first to renew a friendship with the Spaniard, after which he and our other allies will revenge themselves together upon us.

"All these reasons ought to make the King's subjects desire peace, and assist his Majesty in making it such as to be durable. Otherwise the kingdom will be filled with factions and the provinces with desolation.

"The design which seems to have been formed to try and ruin the Huguenots has become so apparent and their distrust so fomented by the punctilios which are used towards them every day, that no one need be astonished if their alarms last as long as that treatment shall last, and that the State finds itself always embarrassed so long as the door is kept open to such cabals. When they cease, and when an order is established under

which every one can live in the repose of his conscience, it is certain that the kingdom will simultaneously enjoy public tranquillity, as it did in the reign of Henry IV., and during the regency of the Queen mother of the King, which is the point to which we must reduce affairs if we desire to preserve peace for France, his Majesty making the Catholics clearly understand that he wills liberty of conscience, and from the Huguenots entire obedience.

"It should here be observed that to make peace it must be concluded secretly and promptly, inasmuch as if it is long upon the *tapis* it will receive so much opposition from the artifices of those who desire war, that it will never be concluded; but if it is not known till it has been already made, no one will dare to cry out against it. And the wicked will find themselves quite ashamed to see themselves outstripped by an action so useful and so necessary to the good of this State.

"And in case that the Huguenots should be obstinate in demanding more than the razing of the said Fort, the King will then be able to have brought and read in his presence the Treaty of Peace of Montpellier, and upon the complaints of the infractions of the abovesaid, his Majesty ought to cast the blame upon the late Chancellor and his brother the Commander, who, one at Rome and the other in France, wished to keep a hold upon both Catholics and Huguenots, giving hopes to the one of a war of religion, and to the other of pacification. And thus having spoilt everything, their memory should bear the blame of it, and by this means put what has gone wrong under cover of all that has passed, so that by one of these two ways, either simply to settle the business in the Council, or to take up the Treaty of Montpellier, his Majesty can make peace without it being necessary to treat anew with his subjects.

"As to the war with Italy, experience has shown us that our arms have never been successful there, and that all those who have carried and drawn us into it have only done so for their own private interests, which having been satisfied, they have afterwards always abandoned us to our confusion; that nation being too doubled-faced, too deceitful and artful for us to meddle with, and for us to make use of for our affairs. And although we must not engage ourselves too far in the war of Italy, we nevertheless must not abandon all at once the Duke of Savoy, but help him as much as will be possible for us to do, with the view of making an advantageous peace. And to effect this we should send the vessels through the Straits [*faire passer les vaisseaux*], as well as those of the Sieur de Soubise, for which the expense is already incurred, and thus we might unexpectedly appear together on the coast of Genoa in order to attempt afterwards to treat advantageously and to retire gloriously.

"Let us now return to Germany, to the interests of which it seems France ought to be so sensitive that we may say she cannot abandon them without abandoning herself. Forasmuch as, besides its neighbourhood to us, the loss of this country, which is so great, so populous, and so filled with powerful cities, will render the House of Austria so redoubtable, together with the intelligences and alliances which she has with Spain, that it will be impossible for France to be able to subsist in the midst of two so powerful monarchies, enemies of this State.

"Again, it must be considered that this nation is simple, easy to gain, and that the greater part of the Princes who are in it are allies of this crown, and have even taken our Kings for Protectors of their liberty, a title which his Majesty ought to be jealous of keeping if he desire to preserve his reputation and his honour; since this is to some extent to obtain a share of the Imperial dignity. There is not a prudent man but will see the importance of the loss of the countries of Cleves, Juliers, the Upper and Lower Palatinate, and who does not tax France with her forgetfulness or with her blindness. And this all

the more as it was easy for the King not only to have prevented the loss, but even to have preserved them for himself. The same can be said at the present time of the rest of Germany, if France is so careless of herself as to abandon her, as Germany can maintain herself in her liberty with the protection and assistance of the King as easily as she will fall under the Spanish yoke if his Majesty does not promptly assist her.

"Henry II. in the same conjuncture which affairs are now in (seeing that there was then as well as now a diversity of Religion in his Kingdom) nevertheless made no difficulty in raising a powerful army and marching himself at its head to protect his Allies, which the Emperor Charles V. was oppressing in the same way as the House of Austria is now doing; and as his march was as useful to himself as to his Allies, who will now prevent the King from doing the same? All things ought to incite his Majesty, and none to turn him from it, unless it be those who will be jealous of his glory and of the advantages which he may derive from it. The King's arms cannot but be very honourable and very profitable in Germany, honourable in that they prevent the ruin of so many Princes and Republics who cannot be overwhelmed but to the detriment of France, and in that his Majesty will preserve to himself the Title of Protector which this nation has given to our Kings; and profitable in that in this protection the King will find the means to accommodate himself [*s'accommoder*] with several countries in the neighbourhood of his Kingdom. Even as Henry II. did at Toul, Verdun, and Metz, of which last Bishopric there are still several places, boroughs, and villages in Germany which depend thereon, which his Majesty may easily seize, besides that which may be done in Alsace and along the Rhine, on the which it is all important to France to have a passage, which will be acquired very easily by undertaking this design, there being even Princes who will willingly surrender it in order to be delivered from the oppression they are under.

"Moreover the King is obliged, both by reasons of state and by consideration of the alliance with England, to procure the re-establishment of the Prince Palatine in his countries and dignities, and it is in vain to think of committing the execution of this to the Comte de Mansfeld, if his Majesty does not join in it in good earnest—the Princes of the Protestant League and all the Hanse Towns being so cast down that they will never dare to undertake anything if they do not see a Royal army to animate them. But if they see such an army in the field, it cannot be doubted but that all unanimously would make a grand Corps d'Armée, and that they would rise with renewed vigour. By such means his Majesty will overthrow the usurpations of the House of Austria, will wrest the Palatinate from the Spaniard, will acquit himself towards England by giving actually the assistance promised, and will yet find the opportunity to extend the limits of his State; which advantages he will find neither in war with Italy nor in a war with the Huguenots. Furthermore, it is to be considered that the King undertaking war in Germany, he strikes (as they say) two blows with one stone, inasmuch as he obliges England and thwarts Spain. For he can give trouble to Spain through the King of Great Britain; and when France attacks Germany, she will ruin the Emperor. This will burn the House of Austria at both ends without any one being able to say that the King declares war against the King of Spain [*rompre la guerre avec le roi d'Espagne*]. All that is above written is feasible, and ought to be done, if only the interests of the King are thought of; and if by a false step his Majesty is brought to resolutions to leave external affairs to themselves, in order to make war within, he will infallibly cast his kingdom into desolation, whatever good success he may have, and will lose the fruits of the alliance with England, with the chance of having that King for an enemy. Besides

that, whatever peace is made with Spain, France cannot rely upon her promises, nor upon having her hereafter for a better friend."

If this document was Richelieu's, the question at once arises, How came Richelieu to change his mind? The answer probably is, That the two discourses point to a different state of circumstances. In the first, given in the Memoirs, Richelieu refuses to advise the razing of the fort because it will give credit to Rohan and Soubise. In the second, he does not mention this, but speaks of a humble submission of the Deputies as a possible thing. I therefore suspect that he already fancied that the Deputies were coming in a humble frame of mind, if he had not already conversed with them, and he was, therefore, able to give vent to his best sentiments without any further difficulty.

Everything, too, which we know from the despatches of Lorkin, the English agent in France, points this way. On June 28, Gondomar, who visited the French Court on his way to Brussels, took his leave without venturing to address the King on political subjects. On July 5, the Deputies humbly threw themselves at the King's feet, and in a letter of July 8, Lorkin speaks of a most encouraging interview with Richelieu, in which the Cardinal said to him, "*La paix se fera : assurez vous de cela.*" But in spite of this the negotiation dragged on, and on the 20th the Deputies were so far in despair, that they talked of returning home. On the 21st they took leave, but asked to be heard in council. The King was present, and talked of razing the fort within six months or a year, though he refused to do all that was asked of him on other points. Upon this, however, the negotiation was resumed, and, on the 24th, an agreement was made subject to the approval of those by whom the Deputies had been sent.

The following is a translation of the draft of the engagement which the King promised to make if the conduct of the Deputies was approved of by those who sent them, a blank being left for the subsequent insertion of the date. (*State Papers, France.*)

"To-day, on the _____ of the month of July, 1625, the King being at Fontainebleau, on the assurances which have been given him of the fidelity and obedience of the inhabitants of the city of Rochelle by their deputies, his Majesty, after having received their submissions, wishing to believe that they will in future comport themselves as good and loyal subjects—and that they will, by their actions, render themselves worthy of his grace and favour—his said Majesty wills that the declaration of Montpellier, of October 20, 1622, be executed according to its form and tenor, and, in consequence of his declaration of the 24th of the said month, has promised and accorded that Fort Louis be razed and demolished in one year at the longest. In witness whereof his Majesty has commanded me to prepare the present declaration, which he has signed with his hand, and caused to be countersigned by me, his Counsellor of State, and secretary at his commandments. PHILIPPAUX."

It may be remarked that the complete concurrence of the line adopted with the course advised by Richelieu gives an additional reason for accepting the anonymous discourse as his, whilst the fact that nothing is said in the Memoirs about this important concession makes it impossible to found any argument upon the silence with which the

discourse is there passed over. It may be added that the recommendation to take up the war with Spain vigorously was also adopted, and that Lorkin's despatches of the end of July and the beginning of August are full of notices of military preparations. Why then did Richelieu say nothing about it all? Simply, I believe, because his high attempt at a noble policy failed through no fault of his own. From Lorkin's despatch of August 21, we learn how Toiras, the French commander, set on, it was thought at Court, by the Prince of Condé, fell upon the reapers of Rochelle as they were gathering in their harvest, killed some of them, and set fire to their corn. The Huguenot spirit within the walls was all ablaze with indignation. The King's terms were rejected, and war was preferred to a base submission. Yet of all this Richelieu, in his Memoirs, says nothing. The agreement made at Fontainebleau, which only just escaped being the foundation of a permanent peace, is buried in as complete oblivion as his own advice upon which it was founded. The war with Rochelle took its course, and ended three years later in the triumphant entry of the King into the captured city. Richelieu, therefore, it may be supposed, whilst he took care to preserve a record of the advice which he had given tending to the continuance of the war, took care not to preserve the advice which he had given tending to the discontinuance of the war. The story thus revealed, it may be added, has an interest for students of English history as well as for the admirers of the great Cardinal. The peace thus apparently made was the motive which induced Charles I. to give up to the French government the English ships which had been promised for the siege of Rochelle, and we thus learn that there was no hypocrisy in Buckingham's declaration to the Parliament at Oxford that those ships would not be used against the Huguenots.

SAMUEL R. GARDINER.

Memoirs, Letters, and a Selection from the Poems and Prose Writings of Anna Laetitia Barbauld. By Grace A. Ellis. In Two Volumes. (Boston: J. R. Osgood, 1874.)

Memoirs of Mrs. Barbauld, including Letters and Notices of her Family and Friends. By her Great-Niece, Anna Laetitia Le Breton. (London: George Bell & Sons, 1874.)

As long ago as when the *Quarterly Review* was young and virulent, the name of Mrs. Barbauld suggested the thought of hymns in prose, shagreen spectacles and knitting needles. An anecdote given by Mrs. Le Breton will serve to correct this rather one-sided impression, and prepare us to do justice to a really respectable eighteenth century essayist, poet, and politician. She was the daughter of a dissenting minister and a lady who had, at the age of fifteen, inspired the Rev. Dr. Doddridge with a passion that is expressed with a comic, matter-of-fact earnestness in a letter printed in the Appendix. Dr. Aikin, the father, kept a school at Kibworth until his daughter Laetitia was fifteen, when he was appointed theological

tutor to the newly founded Nonconformist academy, or college, at Warrington. Hither a rich farmer followed the family and begged Dr. Aikin's consent to his suit for her hand. Lucy Aikin, Mrs. Barbauld's niece, must tell the rest of the story:—

"My grandfather answered that his daughter was then walking in the garden, and he might go and ask her himself. With what grace the farmer pleaded his cause I know not; but at length, out of all patience with his unwelcome importunities, she ran nimbly up a tree which grew by the garden wall, and let herself down into the lane beyond, leaving her suitor *planté là*."

This ready-witted, ready-limbed, unsentimental young lady had a mother with a keen sense of decorum and the peculiarly feminine proprieties; her father taught her Latin and a little Greek; her brother insisted on the publication of her poems, and of a prose volume of "Miscellaneous Pieces," in which his own share was not the most distinguished. Her success as an authoress was rapid and unequivocal. Fox praised her style; Johnson, whom she had presumed to imitate in a fragment, "On Romances," which has all the solemn merits of the original in addition to the wilful skill of parody—pronounced that, of all his imitators, she alone had succeeded in aping the sentiment as well as the diction. The female Johnson, the English (the very English) Sévigné, the arbiter of literary fashion, Mrs. Elizabeth Montague, begged her, with flowing compliments, to preside over an institution that was being talked of to regenerate the education of women. But Miss Aikin was by this time thirty-one, and had developed, together with a little romantic sensibility on her own account, some curiously severe views as to the conditions under which such moderate learning as her own might permissibly be acquired by others of her sex. She objected altogether to the plan of an academy or public school, as violating the tacit regulation, "like that of the ancient Spartans," according to which "such thefts of knowledge are only connived at while carefully concealed," and concludes an amusing dissertation on the feminine ideal by protesting that she herself is not qualified, by birth, breeding or education, to superintend the "genteel accomplishments" which are the most important part of the education of young ladies of rank. Her marriage to Mr. Barbauld, the son of a French refugee, is described by her niece as resulting from "the illusion of a romantic fancy, not of a tender heart;" and it is implied that the somewhat formal Puritanism of her home and academical surroundings made her too ready to see a St. Preux in the first demonstrative foreigner it was her fortune to meet; but this seems an unduly harsh account of a resolution in which she was fixed by the information that Mr. Barbauld had already suffered from an attack of insanity. "Then," she answered, "if I were now to disappoint him, he would certainly go mad." They were married accordingly, and set up a school for boys. Her *Early Lessons* and *Hymns in Prose* were written for the youngest class, which she used to teach herself, and for her nephew Charles, one of her brother's sons, whom she adopted. With the exception of

these popular little books and a memoir of Richardson, the novelist, prefixed to his correspondence, Mrs. Barbauld wrote little during her husband's lifetime: he became insane some time before his death in 1808. Her last publication was the poem called "Eighteen Hundred and Eleven," which is only remembered now because it is supposed to have contained the original suggestion for Macaulay's New Zealander, though the Quarterly Reviewer (in this case believed to be Southey) in 1812 thought its patriotic gloom and despairing aspirations after American liberty and glory sufficiently dangerous to the public mind to require severe and, as already intimated, personal denunciation of the elderly authoress. The poetical merits of the composition were prudently left undiscussed, for it would have been impossible to deny that, according to any ordinary standard of political verse, they were considerable, a few short-sighted auguries notwithstanding, as that Joanna Baillie's

"high-souled strains and Shakespeare's noble rage
Shall with alternate passion shake the [American]
stage;"

that the fame of Thomson as well as Milton will continue to be heard above the roar of Niagara; and that the Genius of Commerce, deserting England, was about to repair not only to the United States, but to South America as well.

Miss Ellis's *Life and Works of Mrs. Barbauld* must be taken as a sign that America is not ungrateful to its early champion; but, as a general principle, it may be observed that a biographer who incorporates the letters of his or her hero or heroine with the substance of the memoir should abstain from repeating before and after each letter the biographical details which are to be gathered therefrom. We could also have dispensed with the rather startling conjecture that Richardson owes most of his readers at the present day "to the excellence and attractive style" of his life by Mrs. Barbauld. Mrs. Le Breton's memoir is less detailed, and reproduces few of the letters published with her works by Lucy Aikin in 1825. On the other hand, it opens with an interesting chapter of family history, going back to the reign of Charles II. It supplies some details omitted by Miss Aikin on personal grounds, and contains letters from and to Miss Edgeworth and her father which have not apparently been printed before. The strong common-sense which was Mrs. Barbauld's chief characteristic shows to great advantage in her criticisms of Mr. Edgeworth's educational vagaries and versatile practical suggestions. One of his proposals was the foundation of a "lady's paper," to be supported by all the literary ladies of the day, to which she objects that Mrs. Hannah More would not publish with her, nor she and Miss Edgeworth with Mrs. Godwin. The other letters given by Miss Ellis are only noticeable for their comparative simplicity of style and occasional details made curious by their date. For instance, in 1804, describing a visit to Tunbridge Wells, she writes *donky*, and wonders whether the orthography is right; and in 1797 she asks her brother if he ever saw "*seguars*—leaf tobacco rolled up of the length of one's finger, which they

light and smoke without a pipe?"—the innovator being a Spanish pupil of Mr. Barbauld's.

The one poem of Mrs. Barbauld's that may be expected to live, her "Stanzas on Life," written at the age of eighty, is given by both biographers, with the story of how Wordsworth said to H. C. Robinson that, though he was not in the habit of envying other people their good things, he wished he had written the lines—

"Life we've been long together,
Through pleasant and through cloudy weather."

Some of her "Enigmas" are also well known, and are favourable specimens of a rather unprofitable kind of ingenuity; her "Address to Coleridge" offended its subject by the accent of a school-dame still seeming to linger in its flattering admonition; her hymns failed to come into congregational use, though one of them (the tenth) may have suggested the reply of the witty prelate who was asked to tell the shortest way to heaven: "Take the first turn to the right and keep straight on:" as a rule, her muse is most successful in serio-comic themes, such as the mysteries of "Washing Day," or in the "School Eclogue," which Miss Ellis has hardly done wisely to omit, as it contains some really happy bits of parody. Her prose fables and allegories, in the fashion of the *Spectator* and its imitators, are constructed mechanically, and have neither the imagination nor the eloquence needed to outlast the fashion; a dialogue, on the other hand, "Between Madame Cosmogonia and a Philosophical Enquirer of the eighteenth century, January 1, 1793," has enough lively irony to recall Leopardi's conversation between Atlas and Hercules, though certainly it suffers by the comparison. The short prose essays on "Monastic Institutions," "Against Inconsistency in our Expectations," on "Education," on "Those kinds of Distress which excite agreeable Sensations," and similar subjects, which caused her admirers to regret the waste of her powers in the composition of reading-books for the nursery, belong equally to an extinct class of writing, and have a right to be remembered as among the best specimens of the class. To clothe unexceptionable ideas in unexceptionable language is at least as lawful an object of ambition as to invent shades of thought and eccentricities of expression with the sole and questionable merit of novelty. Perfectly just and reasonable sentiments do not forfeit their claim to correct utterance because every one assents, with a readiness passing easily into unconcern, to their justice. Immortal commonplaces like Mrs. Barbauld's amplification of Epictetus ("Against Inconsistency in our Expectations") are redeemed from literary insignificance by a degree of finish in the style which no writer can be expected to bestow on an obviously ephemeral theme, whilst the absence of speculative depth, the essential triteness of the argument or exposition, cannot seriously be complained of when trite and immortal misconceptions are being assailed. The sense which is, or which ought to be common, excellent English and a fine masculine self-respect give the essays a degree of substance which fully justifies the esteem in which the writer was held by her contempo-

aries. Where she departs at all from the beaten track of her co-believers, it is generally, as in her estimate of "Monastic Institutions," in the direction of views since allowed to be rational and moderate.

EDITH SIMCOX.

Through Russia from St. Petersburg to Astrakhan and the Crimea. By Mrs. Guthrie. In Two Volumes. (London: Hurst & Blackett, 1874.)

MRS. GUTHRIE is evidently accustomed to travel. She has seen, we are given to understand, many lands, and has acquired the habit of "doing" them systematically. She displays all those qualities and capacities which are essentially necessary for the constitution of a good tourist: indomitable energy, vivacity, and cheerfulness under the most trying circumstances; in addition to this, she has that erudition which is but another form of power of reference, and possesses the cunning art of making a book on all she has heard, seen, and picked up from various sources. Mrs. Guthrie's book demonstrates all this; it also shows that she has derived much pleasure and benefit from her travels in Russia; that she has much quaint humour, common sense, and originality of idea; she forces many a smile from her reader by her reproduction of ridiculous and ludicrous explanations, and of pretended experiences of others, while she has doubtless her own misgivings as to their genuineness. And we cannot help laughing (if she will pardon our saying so) as much at her own blunders as at the nonsense which the Viscount de G. and other malicious people of that stamp were always ready to impose upon her and her companion. There is nothing in Mrs. Guthrie's first volume which is new except her own individuality, for it is not much more than a chatty edition of Murray's *Handbook*, toned down with the aid of some unnamed histories of, or works on, Russia. In many instances it would have been safer to stick to the Murray, as the modifications have led Mrs. Guthrie into numerous errors. But Murray diluted and refortified with "spirits," is, after all, not such bad stuff, and we are confident that this dose will be more successful than the camphor she administered to the gentleman "with the pain in his stomach."

Mrs. Guthrie perplexes us when she tells us that "Finn is properly the name of the Lapps belonging to Norway and the district of Finland, the natives of the Grand Duchy of Finland being called *Quains*." She does not tell us what she means by the "district of Finland," and we confess we are fairly puzzled by "*Quains*." The women in Sweden are all *quennor*, and the men *carlor*; it is probable that this may have misled the authoress. A little further on we are informed that Abo (not Abo, A is pronounced O; vide Murray's *Handbook*), lies "at the mouth of the Gulf of Bothnia," and that the course from Stockholm is *due east*. This should be taken notice of by the Royal Geographical Society. We fancy we begin to trace the malignant influence of that arch-deceiver, Monsieur de G., in the Gulf of Finland, which "would probably be interesting to a

geologist, for imbedded in the red granite were large patches of the purest white marble, which we at first imagined to be collections of sea-gulls." The patches in question are not very unlike groups of remarkably quiet sea-gulls when seen from a distance, but a nearer acquaintance has taught us that they are nothing more marvellous than large dabs of red and white paint on the rocks to indicate the channels.

The authoress is mistaken in her statement (p. 12) respecting the resemblance between the Finnish and Swedish tongues; there is neither affinity nor resemblance between the two. With respect to her statement to the effect that she saw hovels built of timber with the bark on, we are confident that her sight deceived her; for to say so is to imply that the Russians are ignorant of the first principles of the only form of architecture in which they are *facile principes*.

It is a pity that Miss Guthrie—who, we are given to understand, has a talent for sketching—did not embellish the work with some of her own drawings. Finnish and Russian scenery, it is true, present but rare attractions; but Monsieur de G.'s "strikingly handsome friend," for instance, might have afforded scope for artistic powers, or Monsieur de G. himself might have served for a picture, and he richly deserved to have his features made public for endeavouring to perpetrate a fresh hoax by attempting to explain "the difference between a serf and a peasant." The "*Beautiful*" (vol. i. p. 248) St. Basil would doubtless have been excellently portrayed even if Miss Guthrie had drawn him only from imagination, and aided by her mother with a correct reference to "*Murray*," the "*beatified*" expression might have been advantageously introduced. But Mrs. Guthrie's "*companion*" appears to have been sadly idle—not in the least, in respect to sketching, like Mrs. Guthrie herself, who was so "full of zeal." We find a mention of only one occasion on which the younger lady was "out with her pencil," although she did, indefatigably and bravely, explore some heights and excavations; the work is, consequently, adorned with frontispieces which are only copies of photographs.

At page 90 we are told that *bolsani* (Mrs. Guthrie should have written *bolvani*) means *idols*, and that it is considered in Russia a great honour for men to have statues, called *bolvani*, erected to their memory. The fact of these statues being called *bolvani* would prove the reverse of this statement, for *bolvan* means block, or dummy, such as a barber's block. No wonder then the country people are puzzled to see block-heads exalted on pedestals! We decidedly disagree with Mrs. Guthrie when she says the Russians possess a natural disposition for the acquirement of foreign tongues. They jabber foreign languages long before they know their own, and that they never do perfectly. Those whose tongues and ears have not been trained to foreign languages from earliest childhood speak French and English with an excruciatingly bad accent, and their foreign idioms are in all cases foreign to the country whose language they may be familiar with. De Custine observed this. Mrs. Guthrie indulges in many

misnomers, and revels in misprints, such as Zelagin for Yelagin, Kazumofski for Razumofski, Aivarofski for Aivazofski, &c.

Having dipped into Murchison Mrs. Guthrie should not have written Chorno Ziemē for Zenlia. We have never heard of *trescon* nor *trervan*, and a church dignitary is a Vladyka not a Vladka. We decidedly object to *grised* locks and to Mrs. Guthrie's "*lain down*." Some greater distinction, too, might have been made between *stehi* (which may be taken for Stikhi-rhymes) and *stehi*, the national potage.

Mrs. Guthrie will pardon us for saying that she is wrong in asserting that the water of the Neva is *turbid*, and what astonishes us more even than all the errors in Vāmbèri's descriptions of Samarkand and Bokhara is that she spans the Neva with more than one "*handsome bridge*" (p. 49). Her description of the merrymaking on the frozen Neva is entirely drawn from imagination—she has doubtless been favoured by that ubiquitous arch-deceiver Monsieur de G., for torches of pinewood never really blaze on the ice; mazurkas do not merrily go on; ice mountains are never built thereon, from the summit of which the people "delight to slip down;" for the only truly national amusement of skating, &c., is the special delight of the English and of other foreigners.

We would assure Mrs. Guthrie that the "*Kazan Tartars*" who came on board the steamer (vol. ii. p. 17) were not Tartars at all, but probably the Kalmuks whom she so longed to see. In the course of her reading she must surely have learned that the so-called Tartars are Mohammedans, and that as such they do not wear tresses, or long plaits of hair, but that they shave their crowns. It is surely cruel of Mrs. Guthrie to say, after having "admired the mate's honest pair of blue eyes, with which he looked every one straight in the face," that she and her companion were at last tired of their glare. We shall hope, however, that we are mistaken in her meaning, and that she is here alluding to the glare of the chimney or of the sun.

The Reverend Mr. Thomson, of St. Petersburg, will feel somewhat scandalised when he learns that it is said of him that he closes the Embassy Chapel on a Sunday. Monsieur de G. has again, we fear, misled Mrs. Guthrie by telling her that the service is usually performed at the house of the Ambassador at St. Petersburg. He seems to have done so with the maliciously selfish object of monopolising the English ladies' society on the day of rest.

Speaking of the Russian steppes, Mrs. Guthrie astonishes us as usual with the amount of information she has gained from learned books of every description. In most instances we detect a hidden authority; in one or two he is named. The late Sir Roderick Murchison has been pressed into her service, and he is actually named in support of the reason which the natives give for the utter nudity of their plains. Sir Roderick did really "disbelieve in the former existence of forests which have been destroyed," but he did not account for their absence solely by the want of dew. He refers to the

Tcherozem, or Black Earth zone of Russia, when he says that no vegetable fibre has been detected in the soil; and while he states that "by no efforts could any government produce forests in those districts, except in certain rocky and moist spots," he attributes the want of wood as much to climatic conditions as to the lack of dew. We are, however, inclined to dispute the theory. For we have ourselves seen gigantic trunks of trees in ancient river courses in the steppes, and in many a denuded steppe region east of the Volga trunks of similar leviathan proportions are to be found.

Describing the dress of the "peasants," as the Tartar hotel-keepers seem to be called in Russia, Mrs. Guthrie dexterously, and with great delicacy, avoids all allusion to the garment which outwardly distinguishes the male from the female. "Their summer dress is slight enough, consisting of a gingham shirt, generally pink, which is tucked into high wrinkled boots, and over this garment a sleeveless coat with a full skirt, which comes down to the knee." In this passage Mrs. Guthrie entirely eclipses the school-mistress of the story, who, to save appearances, draped the legs of the tables in her seminary. At page 3 of vol. ii. Mrs. Guthrie is again and equally discreet; for we find that the husband of the "stout and middle-aged woman," with crimson shirt, black cotton-velvet coat, immense wrinkled boots with red tops, which served as extra pockets, and a round cap, but without—may we say continuations? Wherefore this extreme reserve? For, if we may "fancy the British matron undressing upon an animated shore, and taking an airy dip in the Volga," and be horrified, we might as well be told that the Russian wears trousers, if only in order that we might be persuaded to fancy that Mrs. Guthrie was not aghast at the sight of a moujik without them. We are therefore inclined to think that, although Mrs. Guthrie and her companion "got rid of a prejudice" when they found they could dispense with their chemises after bathing in them (vol. ii. p. 181), they have preserved some other ones.

Had Mrs. Guthrie trusted to her own self entirely in St. Petersburg and Moscow, she would have produced a better first volume; but having wasted her energies over books of reference, she has gone astray, and having placed too much reliance on the statements of Monsieur de G., and thus given him encouragement, she has suffered the consequence, and her readers will suffer in proportion. But life is dull in Russia, and an occasional vivacious and amusing English lady who may fall in the way of an amiable and unoccupied French gentleman like M. de G., must necessarily be victimised.

In pronouncing this judgment on the first volume, we entirely exonerate Miss Guthrie from all blame, for it does not appear that she has had either part or parcel in the work, except on a single occasion when she aided and abetted in "jotting down notes from Murray."

We turn now with a lively satisfaction to the more agreeable and congenial task of pointing out the excellences of Mrs. Guthrie's work, which strongly reminds us of Pepys's quaint and amusing Diary. Taking

up the second volume, we follow Mrs. Guthrie down the Volga to Astrakhan, back again to the Don, and thence to the Crimea. All that she has to say here is said so well, so freshly, and so humorously, that the scenery and the incidents come home to us as though they were the impressions of yesterday. Mrs. Guthrie is here entirely herself, and is therefore powerfully attractive.

Her book is full of pretty passages. Her description of the scenery is given in plain good English, and borders even on the poetic; there is no exaggeration, no extravagance or vulgarity. The reader will be pleased with the passage on the spiders at the railway station at Tsaritsyn; but as an example of Mrs. Guthrie's pretty writing, we quote the following few words: she is on the river:—

"The scene itself was picturesque enough. The moon was nearly full, and appeared to swim in a luminous atmosphere, emitting a glorious light, which contrasted finely with the deep black shadows. Not a ripple stirred the calm surface of the water."

Or again:—

"Turning our steps towards our floating house, we discovered a road skirting the sea, which shone and sparkled in the brilliant moonlight. One half of our ship lay in the deepest shadow, but every rope and spar was as visible as if it had been broad daylight. The modern Temple of Theseus stood out majestically against the dark rock and looked lovely in the silvery light. We tried to picture to ourselves this craggy mountain ornamented with its temples, palaces, villas, gardens, and to imagine how beautiful it must have been on some such evening twenty centuries ago. Such thoughts were not untinged with melancholy, making as they did our span of life, our struggles, our desires, all seem so small and evanescent."

The headland of Mouna Kastele is admirably delineated at page 151; and who among us will not be moved on reading these heart-stirring lines on the sight of Balacava. The one word Balacava had been uttered on board the boat, and

"I hastened on deck thankful to be alone for a few moments. Unexpected tears rose to my eyes as I thought of our gallant army, of their hardships, their sufferings and their courage, and of many a mother's joy who lay quietly there under the green sward."

We could quote other passages, but as the book is full of such unaffected grace and pathos, we may safely leave it to recommend its own self to the reader. Those who have performed the same tour through Russia, and those who have not been to that country will be equally charmed with this work, which will certainly prove a success and establish for Mrs. Guthrie a well-earned fame.

ROBERT MICHELL.

Droll Stories from the Abbeys of Touraine.
Translated into English complete and unabridged. (London: Chatto & Windus, 1874.)

PEOPLE who reproduce recondite or obsolete literary garbage occupy a position which it is easy for them to defend, and which it is difficult to assail. To find fault with their wares is to advertise them, and to expose the reviewer to the easy charge of prudery. It often happens, too, that there is here and there a jewel hidden in the dunghills of the past, some pure song among the many base ones of Théophile Viau, some fact of historical value in the gossip of Mrs. Aphra Behn. It

is a pity that the student should not have such books always beside him; as if the poorest student had not easy access to them in public libraries. Still, there is this shadow of an excuse for many reprints of books which are meant to appeal only to prurient curiosity. And when they are produced with some care and costliness in type and paper, the chances are that they will not fall into the hands of readers whom they are likely to injure.

None of the excuses we have mentioned can be urged by the translator and the publishers of Balzac's *Contes Drolatiques*. The translator says in his preface:—

"In France the work has long been regarded as a classic—as a faithful picture of the last days of the *moyen âge*, when kings and princesses, brave gentlemen and haughty ladies, laughed openly at stories and jokes which are considered disgraceful by their more fastidious descendants. In England the difficulties of the language employed, and the quaintness and peculiarity of its style, have placed it beyond the reach of all but those thoroughly acquainted with the French of the sixteenth century. Taking into consideration the vast amount of historical information enshrined in its pages, the archaeological value it must always possess for the student, and the dramatic interest of its stories, the translator has thought that an English edition of Balzac's *chef d'œuvre* would be acceptable to many."

No doubt it would, and no doubt a translation of the Marquis de Sade's *chef-d'œuvres*, or of any other "scrofulous French novel," would be acceptable to many. But the translator, like everyone else, must be perfectly aware that the historical information of the book is absolutely worthless, that it has no archaeological value at all, except in the same sense as *Esmond* has archaeological value, that is, as an imitation of the style and manners of the past. And the style and language of the *Contes Drolatiques* are not nearly so successful in this direction as *Esmond* is. The old French is like no old French in particular, indeed, it resembles nothing so much as the bastard old English of lady novelists, who put y's for i's, and spell *the, ye*, and begin all the substantives with a capital letter. There is no philological instruction to be got from this kind of thing, and even if there were, it would be lost in a translation. To be sure, the translator does his best by using some fine old examples of well-known errors in English grammar, such as "the wise man would *lay* at full length in a ditch." To translate Balzac's *Contes Drolatiques* then is inexcusable on historical or antiquarian grounds. Even Beroalde de Verville has the value of being the exponent of the nastiness of a past age, but there is no historical value in a modern imitation of Beroalde de Verville. And even if the *Contes* were useful to the student, a student so advanced ought to be able to read them in the original French. Nor has the book the excuse of being published at a price beyond the humblest purse, or in a form meant to please the lover of beautiful typography. It is got up like the boys' books that are current at Christmas, and an illiterate but well-meaning grandmother might probably give it to a boy. Now, even the author would have objected to this: for when Balzac, in the preface to the first edition, defended his work as a work of art,

he also said that it was intended *pour les lecteurs choisis*. The present translation appeals to the public at large, to a public which has none of the education that would enable it to appreciate the art without taking harm from the grossness.

The *Contes Drolatiques* is a fair example of the baser work of the romantic school of 1830. It deals with mediæval themes, and the author thoroughly enters into the horror and the lust which inform the grotesque of the middle ages. In the voice and with a cracked imitation of the ringing laugh of Rabelais, he tells tales more filthy than any in the collection of the Curé of Meudon, and more hateful in their cruelty than most that disgrace the records of crime in the middle ages. These records are dreadful enough, but they are at least human in their earnestness: men were cruel because they were terrified. But it is scarcely human to take such themes for art. A gross age laughed grossly, but there is something apish in the imitative and affected ribaldry of a refined age. A cruel age acted with cruelty, but there is something of the tiger in the artist who in a humane age gloats over torture. Like all Balzac did, his *Contes Drolatiques* are works of patient art. Look at the story of *La Succube*, it is a masterpiece of the romantic school. The blind gropings of pedants in the mysteries of nature and of law are reproduced with the skill of Michelet; a glamour of Moorish colour, a savour of exotic fragrance hangs about the Vampire; but in place of the indignation of Michelet there is only a sound of mocking laughter. And everywhere in the book, in every page, we are reminded that this is the work of that Balzac after reading whom Sainte-Beuve said he felt like one unclean. The book is full of art, but to translate it for English people is to perpetrate another of the many crimes that are done in the name of art. In this *Sabbat* of satyrs, and obscene witches, among these foul scandals of monasteries, and shadows of nameless sins, there appears here and there the face of a woman that is not wholly vile, or of a knight that was not merely a lecher. But there is none of the tender poetry, the pure love that redeem the coarseness of Boccaccio. The romantic school has scarcely produced a more hideous work, or one so likely to do mischief in an English form. The volume is illustrated with Doré's famous woodcuts, now very worn and obscure. Mr. Hamerton and Mr. Ruskin did full justice to these drawings while they were still confined to a book that was not likely to find its way into school-rooms. It may be observed that the publishers have chosen to mutilate Mr. Ruskin's observations in their catalogue. He did not end when he had said: "Nothing more witty nor more inventively horrible has yet been produced," but went on thus: "in the evil literature or by the art of man, nor can I conceive it possible to go beyond either in their specialities of corruption." The honesty which mutilates criticisms for the purpose of advertisement is on a par with the sincerity which asserts that valuable historical and archaeological information may be found in an English version of *Les Contes Drolatiques*.

A. LANG.

CHRISTIAN OF BRUNSWICK.

Der Niedersächsische-Dänische Krieg. Von J. O. Opel. Erster Band. (Halle, 1872.)

THE history of the Thirty Years' War, and of the events which led to it, has of late engaged the attention of many eminent writers. Among the valuable works which have been produced, that of Herr Opel occupies a prominent position. He takes up the great historical drama at its second act. Before his story properly commences the forces of Protestantism, shattered in Bohemia in 1620, had gathered again under Mansfeld and Christian of Brunswick, only to meet with fresh ruin in the Palatinate in 1622. Passing lightly over the early scenes of the war, Herr Opel calls us in to witness defeats of the Protestants in the Palatinate, and their depression consequent upon these defeats. From the first, it is evident that the only hope of the Protestantism of Central Europe lay in the chance of a combination of the Continental Powers adverse to Spain and the Emperor. Yet neither France nor England seemed likely to obey the call. Only the new-born Dutch Republic, the very existence of which was bound up with Protestantism, stood firm, though, from fear lest the German branch of the House of Austria should be led to intervene actively in the Netherlands, they refrained from taking an active share in German affairs. It was then that Christian IV. of Denmark interfered, and the results of his interference will form the subject of future volumes. The first volume, which is now before us, is occupied mainly with the career of Christian of Brunswick, as an introduction to the Danish war that is to follow.

Christian of Brunswick is thus far the hero of the story. We see him in his boyish days, we accompany him as he steps forth into public life, to cut his way to the aid of the husband of his cousin Elizabeth of England. We are spectators of his disaster at Höchst, of his vigorous onslaught at Fleurus, of his crushing defeat at Stadlohn. Those who wish to know how a German prince of that period lived and fought, or to instruct themselves in the details of the social and political life in which he moved, cannot do better than follow Herr Opel's careful narrative. Sometimes, indeed, he misses a point. He has, for instance, entirely overlooked one of Ellis's Original Letters, which gives an account of Christian's visit to England. But in general details are given with almost too great profusion, so as to some extent to injure the artistic completeness of the picture. It is more important, however, to note that the author never disguises his sympathies; in no case does he allow them to interfere with his judgment.

For the proper understanding of this phase of the war, the most noteworthy fact was that this Christian of Brunswick, this born cavalry officer, who rode down armed soldiers and pillaged unarmed peasants, apparently with equal satisfaction to himself, was Administrator or Bishop of Halberstadt. The part which these North German bishoprics played in prolonging the war receives ample illustration in these pages. Ranke has pointed out what was the legal and political position of their holders, and has

argued that their maintenance would have been the maintenance of an elective lay aristocracy to share in the government of the Empire with the elective clerical aristocracy of the Catholic bishoprics and the hereditary lay aristocracy of the territorial princes. Herr Opel takes us behind the scenes and shows us what these administrators were in real life. He makes us understand what a gulf there was between the Protestant sinecure canons, with the Protestant sinecure administrator, and the industrious commercial populations of the episcopal cities, a gulf which must have been all the wider because the very names which these men bore reminded the world of clerical duties which they had no pretension to fulfil.

Herr Opel's account of the installation of the young man at Halberstadt is worthy of being studied by those who wish to understand why these so-called bishoprics were a thorn in the flesh to all devout Catholics of the day. After giving us details of Christian's entry into the city, he goes on as follows:—

"Here, with the assistance of the canons, he put on the episcopal dress, and reappeared in a cassock of red velvet and a square cap, ready to be led to the cathedral in a solemn procession. At its head were the clergy singing as they went the hymn, 'Justum deduxit Dominus,' the use of which had been handed down from ancient times. Next came an ambassador of Christian's brother, the Duke of Brunswick, bearing a golden sword, as a sign that his master held lands from the see, and then between the provost and the dean came the bishop, his train being held according to ancient custom by the provost of St. John's. Last in the procession were the knights settled on the lands of the see.

"In the cathedral the young prince was received with a *Te Deum* accompanied by the organ, and led up to the altar amidst a blaze of lighted candles and the bright colours of the tapestry hangings. When the procession reached the chancel, the four eldest canons placed him on the high altar for his installation. Then the choir sang '*Salvum fac Domine populum tuum*,' and the four canons took the bishop from the altar and knelt with him in the midst. The choir kept silence, while the bishop and those with him sung three times '*Salvum fac Domine servum tuum*.' The four canons placed him again on the altar, and the choir, with the accompaniment of the organ, raised a solemn hymn of praise. When it was ended, the bishop took his seat by his brother to hear the sermon."

If, however, Herr Opel gives us much which is of historical importance, there is also much in his account of the see of Halberstadt (236-76) which is only of local interest. He has, at all events, prepared himself for his work by tolerably extensive investigations in the German archives, and has visited Copenhagen, without, however, finding there so much information as might have been expected.

The policy of the King of Denmark was procrastinating and cautious. In many points it still needs explanation. It is possible that some light might be thrown on it by studies in the archives of the kingdom at the Hague—the domestic archives of the House of Orange give little information in this period—and from the same source something might be learnt on the relations between Christian of Brunswick and the States-General. The letters of Foppe van Aitzema, the Dutch Resident with the Hanse Towns, are still unexplored.

The materials already in print have been made use of by Herr Opel with no ordinary industry and knowledge. He, has, however, omitted to notice the great Dutch work, *Algemeene Geschiedenis des Vaderlands*, begun by Arend, and continued almost to 1648 by Ress and Brill—a tasteless compilation, but one which is very useful from the fulness of its information.

Herr Opel is conscientious enough to point out the portions of the story upon which even his industrious enquiry has been unable to throw light. But in cases where the truth might be found in sources which have not come under his notice, his conjectures are generally correct. It may be mentioned that the above-named work of Arend and Brill contains a full account of the Congress of Segeberg, taken from the papers of the Dutch diplomatist, Vosberghen, which would have filled up an important gap in Herr Opel's narrative, and have enabled him to place the figure of Christian IV. more plainly before the reader.

JAROSLAV GOLL.

NEW NOVELS.

Old Acquaintance. By Mrs. Brotherton. (London: Smith, Elder & Co., 1874.)

Roseteague. By Mrs. Bray. (London: Chapman & Hall, 1874.)

Making the Worst of It. By John Baker Hopkins. (London: Tinsley Bros., 1874.)

Prince Serebrenni. By Count A. Tolstoy. (London: Chapman & Hall, 1874.)

Geoffrey's Wife. By Stanley Hope. (London: Chapman & Hall, 1874.)

Waiting for Tidings. By the Author of "White and Black." (London: Henry S. King & Co., 1874.)

Esther Dudley's Woovers. By Mrs. Mackenzie-Daniel. (London: C. J. Skeet, 1874.)

Old Acquaintance is, as its title honestly enough indicates, a collection of reprinted pieces. These collections appear to be increasing in number out of all proportion to the increase in novels generally, though, to the best of our knowledge and experience, they are not popular with thorough-going novel readers. Readers, however, of another order may be not sorry for the increase. One often feels disposed enough to bestow twenty minutes on the fiction of one's country, and it is, as a rule, satisfactory to be able to finish the said fiction in that time. Moreover, there is, perhaps, as a rule, better work in these miscellanies than in the larger unities. The stories composing the first part of this volume (entitled "Contributions of the Rev. C. Freshe") are decidedly good of their kind, especially "Monsieur Babon." The chief point about them is the prominence of *couleur locale*, laid on rather thickly but not unskilfully. The second part consists of three stories, one of which, "The Dimplebury Scandal," is well plotted, and in the hands of an unprincipled person would assuredly have attained three-volume honours. But we cannot imagine what can have induced Mrs. Brotherton to insert the sketch called "D.W." and the articles composing the third part, unless it may perchance have been the dire necessity of padding. The last sixty pages are quite unworthy of the rest of the book, and, indeed,

are entirely out of keeping with it. Should *Old Acquaintance* reach a second edition, of which it is fully deserving, we strongly advise Mrs. Brotherton to cancel these unlucky additions. It is hardly fair that a guileless reader, in quest of harmless fiction, should be inveigled into perusing pieces of such exceedingly uncritical criticism as Mrs. Brotherton's remarks on French novels and English poets.

Roseteague adds yet another to the list of Mrs. Bray's west-country stories. It is written, as may be imagined, in a manner which is rather of our fathers' times than of our own, a manner of which *Brambletye House* is probably the best example. *Roseteague* is, however, unusually slight in construction and substance, even for this style; there is absolutely no attempt at delineation of personal character, and very little at historical or local colouring. A rightful heir—two rightful heirs indeed, who are domesticated in the house of the wrongful possessor—a portrait which falls down—an honest smuggler—an abortive Jacobite intrigue—this is all. The language is simple and good. But Mrs. Bray has made one little mistake which surprises us in so determined a Damnonian. She speaks of Dosmary pool as "along the coast." Now Dosmary pool has kept itself as much away from the coast as anything Cornish well can. It is, in fact, perched on the so-called "backbone" between Bodmin and Launceston. We can only account for the error by supposing that Mrs. Bray confused it for the moment with another *lacus fabulosus*—the Looe pool at Helston—which is on the coast, and, like Dosmary pool, is connected in legend with the demon Tregeagle.

It is not at all difficult to trace the antenatal history of *Making the Worst of It*. Mr. Hopkins has evidently devoted himself to the works of novelists like Mr. Wilkie Collins and Mr. Edmund Yates, until a natural but perhaps not laudable desire has come upon him to imitate those masterpieces. To this desire he has given place, and *Making the Worst of It* is the result of his labours. It would probably be quite in vain to remonstrate with him on the style he has chosen; there are people who like it, no doubt, and we shall not be at all surprised to see this book described as "of thrilling interest," and so forth. The plot, on which Mr. Hopkins wholly relies, is really a sufficiently complicated entanglement of the usual kind. An innocent felon who returns, having made his fortune, to his bereaved wife—a virtuous actress, who is accidentally separated from her husband and can neither find nor be found—and a wicked Irish Peer who tries to damage everybody, are the principal actors, relieved by the usual attendance of good-natured detectives, benignant coffee-house keepers, and the like. Unluckily Mr. Hopkins, not being to the manner born, has got tired of his plot, and instead of conducting it explicitly and duly to its end in three volumes, has huddled it up in two, leaving a raw and unfinished appearance which is not artistic. He has also written the first two chapters in a high-tragedy, Kotzebue-and-Lord-Lytton style, which, to do him justice, he does not often adopt, but which would induce many readers

to drop the book at once on coming, for instance, to such a passage as this: "There lay the long-parted husband and wife. He with his arms round her waist. She with her head pillowed on his broad chest. Soon the hubbub of busy life will awaken them. What an awakening! After ten years apart to see each other in the light of day." Mr. Hopkins is also given to the insertion of short disquisitions—*περί σου, περί έμου, περί πάντων πραγμάτων*. In one of these he has added one more article to the catalogue of British institutions which are "the wonder and envy of the nations." We always take a peculiar interest in these objects of envy and wonder, and enrol them with care in our memory. The last we discovered was "the English Sunday," which appeared in this character in a book published the other day. Mr. Hopkins has nearly equalled this. His paragon is "the English newspaper." We can, indeed, quite imagine the nations regarding the *Daily Telegraph* with wonder, but we cannot avoid feeling some little doubt as to the envy.

Prince Serebrenni is a tale of the Court of Ivan the Terrible, and represents it as an even more unpleasant place of sojourn than the ordinary reader's probably vague knowledge of Russian history would suggest. The story is melancholy enough, as nearly all the principal personages are killed and most of them are tortured, though there is no parade of disgusting details. The character of the Czar, with his strange delusions and half-religious ferocity, is well sketched, but might be more worked out. The object of the book, in which it succeeds well, is to exhibit the strange Russian character, with its mixture of sadness and gaiety, its almost frantic devotion, with the unreasoning and unwavering loyalty which regards not merely overt treason, but "not loving the Czar," as the most hideous of crimes, and, above all, with the patriotism which, unlike almost all other forms of that quality, seems to subsist neither by self-conceit nor by arrogance towards others, but to be mere and pure love of country for its own sake. The translation, which is by the Princess Galitzine, is, speaking from the English side, decidedly good.

It must be admitted that *Geoffrey's Wife* is a disappointing book. It begins with a frank avowal that the story is not going to be in accordance with "cold morality," and a protest against "an incapacity for the indulgence of strong emotions." After this the reader naturally settles himself in his chair, expecting something really serious in the analytic way, something before which *Mlle. Giraud ma Femme* and *La Fille aux Yeux d'Or* will have to pale their ineffectual fire. A passion for one's grandmother is about the least that can fairly be set before us after this preface. But nothing comes of it save a quite ordinary recognition on the part of the hero and his friend's wife that they were made for each other. The hero's conduct, too, in this predicament is exemplary. It is true that he once or twice has to confess, "I took her in my arms." But Mr. Wallace and Mr. Crookes have quite recently shown us that this is the accepted mode of welcoming a lady visitor from the spirit world; and consequently any evil construction which

may be at present put upon the practice ought to vanish from our less scrupulously particular sphere. Moreover, there is another justification; for the lady turns out not to be legally the friend's wife after all: and it is no doubt an unconscious recognition of this fact which induces the legal hero to venture so far. The story in a few words is as follows:—Cecil Holford, a lawyer, visits a client, Geoffrey Lumley, on business. He finds a rather singular *ménage*, including an unnecessary companion for the wife, a Miss Kean, and a very undesirable companion for the husband, Mr. Dick Cunnyngame. Holford becomes very intimate with Mrs. Lumley, who is rather neglected, and saves her life in a mysterious equestrian manner, gets returned for a neighbouring borough, and makes the usual speech which upsets a ministry. So much for the first volume; the second contains a due stirring-together of the materials provided by the first, with plenty of seasoning; which word seasoning now means, in a novel, bigamy and murder, as surely as in a cookery-book it means pepper and salt. There is no lack of power up to a certain point, and the plot is fairly ingenious. But, as happens so often in such cases, the ingenuity of the plot is not supported by any skill in the drawing of the characters. It is no use to tell us, after the manner of a stage direction, that A fell in love with B, and that C killed D. What we want is to see just cause for all this in the characters of these personages, so that we may fairly enter into the spirit of the thing. And this is just what Mr. Stanley Hope, and many other novelists, will not, or cannot, give us.

Waiting for Tidings supplies another excellent illustration of the remarks just made. It also affords a proof, if any were wanted, that in novels, as in life, it is much easier to get into a scrape than to get out of it again. The authoress has embroiled her plot with great care and considerable success; her success in disembroiling it, whatever may be the case with her care, has been by no means so great. Margaret Cressingham, an heiress and an orphan, comes at the age of fourteen into the guardianship of her uncle, John Halton, a selfish and apparently imbecile London merchant. Not wishing to be troubled with her, he leaves her to her own devices, at the lonely Lincolnshire village where her mother has died. After the lapse of some time a nominal governess is sent, but Margaret sets her at complete defiance, and ultimately gets rid of her, and returns to her state of nature. Meanwhile she falls in love with a nondescript retainer, half groom, half sailor, and ultimately, under pressure of a threat of sending her to school, and by ingenious management on the part of the nondescript's brother, marries her beloved. The brother also persuades the latter to forge Mr. Halton's name to an acceptance. The result of all this is, as is natural, a tremendous disturbance. The family appear on the scene, behave generally brutally, imprison Margaret in a Bedfordshire cottage, and frighten her husband into departing for America. This is the first part of the story, and despite three glaring improbabilities, the conduct of the guardian, that of the brother, and that of the Halton

family, it has its merits. For the way of settling the difficulties thus started, and of finally establishing Margaret as a respectable semi-British matron, the reader is referred to the book. It will hardly, we think, be denied by anyone who has read it, that there are grave faults in the last half—faults which are all included in the one capital error of insufficient character-study. In a properly organised constitution, all novel-writers ought to be forbidden to meddle with anything like plot until they have produced at least one simple but sufficient study of character.

Some such a study Mrs. Mackenzie-Daniel has attempted in *Esther Dudley's Wooers*, and if the attempt is not completely successful, it is, at any rate, commendably near to success. Indeed, as far as the heroine is concerned, the success is decided enough. Left an orphan at nineteen, with a portion hardly enough for bare subsistence, and no near relatives, she accepts an invitation from a cousin of her father's. This cousin, Mrs. Hartleton, is herself a good sketch, though her untiring notableness and philanthropy, and her remarkable theory that singing hymns to a harmonium is a sufficient restorative after working from five a.m. to ten p.m., are perhaps insisted upon a little too strongly. Esther's uprising from her first morbid and ungracious condition is well outlined. Her wooers are not so good. One, Paul Thackwell (a gentleman of property who takes to overlooking a mine, made to drown his sorrows and expend his superfluous philanthropic energy), though not actively offensive, reminds one perilously of Miss Wetherell's immaculate and intolerable heroes. The other, Mr. Carrington, with his maiden sisters, is too conventionally drawn to be true or artistic. But the goodness of the two principal characters, especially of Esther, is quite enough to atone for a little remissness as regards the subordinates. Mrs. Mackenzie-Daniel is evidently sound upon the main principles of the art: to be more than this is, we suppose, "the gift of fortune."

GEORGE SAINTSBURY.

NOTES AND NEWS.

MR. GLADSTONE has projected a Homeric work, which he will bring to completion at some near date, and which he entitles *Thesaurus Homerikos*, a Register of Matters noted from the Text of the *Iliad* and *Odyssey*. It will be published by Messrs. Macmillan.

Two special features in the edition of White's *Selborne*, which we mentioned a few weeks back as in preparation by the same publishers, will be the editing of the natural history portion by Mr. Frank Buckland, and a chapter by Lord Selborne on the British antiquities lately discovered in the place.

THE Autobiography of the late Mr. Macready will likewise be published by Messrs. Macmillan, with selections from the vast and varied materials he left in the shape of journals, &c., by Sir Frederick Pollock, under whose superintendence the whole book will be brought out.

THE noble gift of the Earl of Shaftesbury to the Public Record Office of the bulk of his family papers, which was first announced some three years ago, has more recently been greatly enhanced in value by the addition of other documents which have from time to time been found by his Lordship. These relate chiefly to the period of the

first and third Earls. Included in them is an interesting addition to the papers relating to John Locke, which form no inconsiderable portion of the entire collection—a letter addressed by Lord Chancellor Clarendon, from Berkshire House, Nov. 3, 1666, to Dr. John Fell, Dean of Christ Church, and Vice-Chancellor of the University of Oxford, to the effect that he is well assured that—"Mr. John Lock, a Master of Arts, and student of Xⁱ Church, has employed his time in the study of Phisic to so good purpose, that he is in all respects qualified for the degree of Dr. in that Faculty, for which he has also full time; But having not taken the Degree of Bachelor in Phisic he has desired that he may be dispensed with to accumulate that Degree, which appears to me a very modest and reasonable request, hee professing himself ready to performe the exercise for both Degrees. I therefore very willingly give my consent that a Dispensacion to that Purpose be propounded to him."

WE are glad to announce that the Duke of Sutherland has allowed his important series of family papers to be inspected by the Historical Manuscripts Commissioners. Mr. Alfred J. Horwood is now preparing a full and detailed report upon this valuable collection, which was originally brought before the notice of the Commissioners by Lord Ronald Gower.

THE Archaeological Congress in Stockholm, of which we have already spoken, will be attended by large numbers of foreign visitors. Nearly 600 members are already named, only half of whom are Swedes. More than 100 members are expected from England, and Mr. Franks, of the British Museum, is the agent of the committee here.

DR. GEORGE MACDONALD is giving a series of six lectures on the principal plays of Shakspeare, at Lady Ducie's house, 16 Portman Square. Tickets may be had from Lady Ducie, or the lecturer, at the Retreat, Hammersmith. Last Tuesday's lecture was on *Hamlet*; last Thursday's on *As You Like It*.

THE late Mr. William Ewing, of Glasgow, has left his fine collection of Bibles and his general library, including his set of black-letter ballads, to the University of Glasgow, together with the sum of 6,000*l.* for the foundation of three Tutorial Fellowships of 80*l.* each. To Anderson's University Mr. Ewing has left his musical library, and another sum of 6,000*l.*

MR. J. HAMMOND TRUMBULL has lately printed for private circulation a monograph on the Origin and Early Progress of Indian Missions in New England, with a list of books published in the Indian language at Cambridge and Boston from 1653 to 1721. It is curious to find Mr. Cotton in 1647 proving from the Apocalypse that the conversion of any heathen nation must not be expected until after the coming in of the Jews, and followed in this interpretation by his leading Puritan brethren. Roger Williams was the first who broke away from this comfortable doctrine, and gave practical proof of his interest in the welfare of the natives by devoting himself to their instruction and Christianisation. The first result of his labours was his *Key into the Language of America*, published in 1643. The work was taken up by John Eliot, and backed by the Government at home, in spite of the cold water thrown upon it by the "pious and godly" Commissioners of the General Court of Massachusetts. Eliot's exertions were immense, and he soon had the satisfaction of seeing the whole Bible translated into the Algonquin language, and printed at the expense of the London Corporation "for the promoting and propagating of the Gospel of Jesus Christ in New England," in 1661. A few years afterwards the Bible was thoroughly revised, and before his death, in 1690, at the age of eighty-six, Eliot had succeeded in translating himself a large number of books into the dialect of the Indians, and in seeing his example followed by others. Mr. Trumbull gives a

list of these works, with a minute description of each, many of them being of extreme rarity and value. It may be added that the last leaf of the Bible translation contained the rules of holy living, in the form of answers to two questions, the second of which asks "What a Christian should do to keep perfectly holy the Sabbath day?" This contradiction of St. Paul is highly characteristic.

AFTER mentioning that, in a catalogue of a coming sale of books, there figures a poem entitled *Charlemagne*, in twenty-four cantos, by Lucien Bonaparte, a French journal gives a list of the works of members of the Bonaparte family. Napoleon I. wrote a *History of Corsica*, in two volumes; a *Discourse on the Truths and Sentiments which it is of most consequence to know*; some little-known copies of verses, notably a fable entitled *The Dog, the Rabbit, and the Huntsman*, beside his letters, proclamations, and the *Memorial of Saint Helena*.

Napoleon's elder brother Joseph published a romance entitled *Moïna, or the Nun of Mont Genia*.

Lucien's works were *Charlemagne*; *la Cynéide*, a poem in twelve cantos; *Stelina, or the Indian Tribe*, afterwards reprinted under the title of *Les Tédénarcs*.

Louis published an *Essay on Versification*; a romance, *Mary, or the Penalties of Love*; *Historical Documents bearing on the Government of Holland*; and two or three plays, including *Lucrèce*, a tragedy in five acts, and Molière's *L'Avare* versified.

The Princess Yénaïde, daughter of Joseph and wife of the Prince of Canino, translated Schiller.

The eldest of the sons of Lucien was the author of a work on the *Birds of North America*; the second, Louis-Lucien, is well known, and highly esteemed in England as a writer on philological subjects; Pierre-Napoléon published a translation into French verse of Niccolino's *Nebuchadnezzar*, and a historical romance in Italian, the *Rose of Castro*. Mme. Rattazzi, grand-daughter of Lucien, has published several romances, beside contributing to a great number of periodicals. Of the two sons of Louis, the elder, who died in 1833, had published a translation of Tacitus' *Agriicola*, and a *History of Florence*; while the younger son, the late Emperor Napoleon III., occupied too prominent a position to render the enumeration of his works necessary here.

A SALE of autographs from M. de Saint-Germain's collection took place in Paris on the 18th instant. It included thirteen letters and forty-seven notes from the Duc d'Angoulême, dated from November 1815 to November 1816, and addressed to the Comte de Vaublanc. The duke had been commissioned by Louis XVIII. to travel through France, particularly the south, to ascertain the state of public feeling and to sound the views of the officials, and he here gives an account of all that he heard and saw. Another interesting item is the *procès-verbal* of the deposition of Pelletan before M. Pasquier, keeper of the seals, concerning the circumstances of the death of Louis XVII., and the opening of the body and removal of the heart by Pelletan, who preserved the heart in a jar and presented it to Louis XVIII.

M. ERNEST RENAN has commenced a course of lectures, at the College of France, on the Book of Job.

MR. WILLIAM AXON has published, in the *Manchester Guardian*, a short description of the marvellous memory possessed by the Rev. Thomas Threlkald, a Presbyterian minister at Rochdale towards the end of the last century. The facts he records are sufficiently well authenticated to be beyond all reasonable doubt, and are of a different order to the cases of vulgar prodigies occasionally heard of, who can repeat backwards an advertisement column of the *Times* after one glance through its contents. It is not much, per-

haps, that Mr. Threlkald as a boy knew the whole Bible by heart, and could give chapter and verse for any obscure quotation; it is noteworthy that he had a passion for collecting petty information on all subjects, the most important and the most trivial, and that he never forgot a fact or a date. He seems to have developed this peculiar taste by a conscious adherence to the laws of mental association, and to have treated his mind as if it were an orderly account-book, daily to be written up and reviewed. The degree to which he cultivated his talent of memory, and the use to which he applied it, suggest certain curious reflections. Might it not be better for us all if we so educated our minds as to be less dependent upon our books? And what might not that man achieve in the present condition of those of the physical sciences which depend most upon mere observation, who could implicitly trust an infallible memory to retain all those innumerable details which are now only stored up in many volumes?

ON Friday, the 22nd inst., the sale of the first part of the library of the late M. Lucien de Rosny was commenced in Paris. This magnificent library, besides containing a large number of valuable manuscripts and printed books, is peculiarly rich in every variety of binding, from the masterpieces of Bozerain, Derome, and Thouvenin down to specimens of cat's-skin. The hide of nearly every possible animal has been made into a covering for the books. Crocodiles, seals, wolves, tigers, panthers, foxes, and serpents have all had to supply a contingent.

THE best Icelandic newspaper, *Thjodolfr*, has passed into the hands of the young poet Sira Matthias Jochumsson. It is said that the needful capital will be supplied by a certain well-known religious society in England, and that the paper will become an ecclesiastico-aesthetic journal. It is probable that such a paper will exactly meet the requirements of the numerous and scattered clergy of Iceland. Jochumsson is one of the most gifted of modern Icelanders, and author, besides the best drama in the language, of an excellent translation of Tegnér's *Fritjofs saga*. That *Thjodolfr* will cease to be political is of no importance, for politics have always been its weakest side.

THE Italian Chamber of Deputies has authorised the removal of the remains of Carlo Batta, the Italian historian, to the church of Santa Croce, at Florence.

THE French Academy of Sciences, in its sitting of the 18th instant, elected M. Tchébychef a foreign associate, in the place of the late M. de Larive.

SOME autographs which were sold in Paris on Wednesday last are full of interest for scandal-mongers. They consist of letters written to the Maréchal de Richelieu by his lady admirers, which were carefully preserved by their recipient, and the authenticity of which is undoubted. The Marshal's reputation for gallantry seems to have been deserved.

TWENTY inedited documents have been discovered relating to Etienne de la Boétie and his family during the fifteenth and sixteenth centuries. It will be remembered that Etienne de la Boétie was united to Montaigne by the bonds of the closest friendship (*Essais*, book i., chap. 27). These documents will shortly be published by the Society of the Historic Archives of the Gironde, which is also about to publish in its fourteenth volume the letters of the Maréchal de Biron, which are preserved in the Imperial Library of St. Petersburg.

THE Society for the History of France has filled up the vacancies on its council caused by the deaths of MM. Vitet and Antoine Passy, and by the resignation of two members, by the election of MM. Siméon Luce, De Champagny, Vuitry, and De Puymaigre. MM. Thiers, Mignet, Paul Meyer, and G. Paris were among the candidates.

MESSRS. Plon have just published a series of historical studies by M. Charles Yriarte on life at Venice in the sixteenth century. The centre of the group is Marc-Antonio Barbaro, ambassador to the Courts of France, Constantinople, and Rome, who reformed the University of Padua, and negotiated the peace which followed the battle of Lepanto. The details of the life of the Venetian patrician have been gained by laborious researches at Paris, London, Vienna, Milan, in Spain, and at the *Frari* in Venice. The work includes chapters on the patricians of Venice, public instruction in the sixteenth century, the reformers of the University of Padua, the preliminaries and results of Lepanto, women at Venice, the Arsenal, the Senate, the Great Council, Henry III. at Venice, &c.

THE last *livraison* of the *Annals of the Archaeological Society of Belgium* is entirely occupied with an article by M. P. Génard on "*L'Hôtel des Monnaies d'Anvers*," which gives a complete history of the coinage of Antwerp from the tenth century to the siege-money struck in 1814. It is of course far too elaborate to be even analysed here. We may notice that the coiner was to be boiled alive in oil or water; that Quentin Massys is perhaps to be reckoned among the engravers of the town; and that Rubens planned a magnificent arch of triumph for the Corporation des Monnaieurs in 1635, on the triumphal entry of the Prince-Cardinal Ferdinand of Spain. His sketches were taken by the French to the Louvre, but restored to Antwerp in 1815.

M. GIRAUD presented to the Academy of the Moral and Political Sciences, at a recent sitting, a portion of a work by M. de Boislile, containing all the original documents relating to the old "*Chambre des Comptes*" that have survived the fires of 1871. The origin of this Chamber, like that of the Parliaments, is still a difficult point in French history. We only know that in the twelfth century the separation of the royal powers was still unknown; the King had only one Council, the *Curia*. It is only under Saint Louis that we find the Council divided into two distinct sections, the one charged with the administration of justice, the other with finance and administrative control. In the first years of the fourteenth century appears the designation of *Chambre des Comptes*, and after 1308 this court ceases to be ambulatory, and settles definitively at Paris. This Chamber, like the Parliament, was at first to be a single one; but, political as well as administrative reasons showing the necessity for provincial Exchequer Courts, the Kings preserved the financial Courts existing in some of the territories which were successively united to the French crown, till at last there were thirteen Courts side by side with that of Paris. The ordinance of Moulins in 1566 was an unsuccessful attempt at unification. The powers of the *Chambre des Comptes* extended to all matters concerning the domains of the King, and were more varied than the name would imply.

As a rule, posts in the *Chambre*, later the *Cour des Comptes*, were not for sale, but were transmitted from father to son; but the place of First President, when put up to sale, was worth from 500,000 to 700,000 livres; and that of *Conseiller-maitre*, 150,000 livres. The income of the First President was for a long time only 2,000 livres; in 1635 it reached 3,000; and in the eighteenth century, though the buying price was 700,000 livres, it brought in an income of from 7,000 to 8,000 livres only. These small material profits were compensated by the most honourable prerogatives. In fact, a detestable law—that of the sale of offices—had produced the admirable result of a magistracy which has remained legendary in the history of justice, and the respectful remembrance of the people. The *Chambre des Comptes* was suppressed in 1791. M. de Boislile's work will extend to several volumes folio.

WE learn from the *Sheffield and Rotherham Independent* that some of the barrows on Broomhead

Moor, about ten miles from Sheffield, were examined on the 18th instant by members of the Sheffield Architectural and Archaeological Society. Four barrows were opened—two of the round type and two of the long; but, beyond the discovery of a few small pieces of oak charcoal, nothing was extracted save earth and stones.

NOTES OF TRAVEL.

THE annual conversazione given by the President of the Royal Geographical Society will, we understand, take place at Willis's Rooms on June 10.

THE next meeting of the Royal Geographical Society will be on Monday week after the Whitsuntide recess, when Dr. Carpenter will read a paper on "The Voyage and Discoveries of the *Challenger*."

COMMANDER COOKSON, of H.M.S. *Petrel*, has lately furnished the Admiralty with a somewhat remarkable report on the guano deposits of Peru. He estimates the entire quantity in the districts which he visited, viz., Huanillos, Punta de Lobos, and Pabellon de Pica, at 7,400,000 tons. The question of how long a time was taken to form these enormous deposits is a very interesting one, and very difficult to solve. No doubt sealions and seals have contributed largely to many of them, as in working the guano a great quantity of bones of seals are found, but the deposits of "white guano" are formed solely by birds. From information gathered by Commander Cookson, he is disposed to think that these deposits have not necessarily taken the enormous period of years in being formed which is commonly supposed. A native resident at Pabellon de Pica for more than forty years told him that when he first came there the whole promontory was covered with birds in countless numbers; but that about twenty-six years ago a plague visited them, and they died literally by millions. Since that time they have almost disappeared from the locality; they were chiefly pelicans, gannet, and a species of tern. It is a common remark on the coast that all birds are rapidly becoming scarce.

TRÜBNER'S *Record* announces that the California Historical Society are about to publish a reprint of the *Noticias de la Nueva California*, by the Rev. Fr. Francisco Palon, who was the first priest of the mission at San Francisco. The author was a careful observer and historian, and his work, which is now very rare, contains many valuable papers, journals, official documents, and records of early explorations.

ACCORDING to the same authority, Mr. Hubert H. Bancroft, of San Francisco, has for some years past been collecting a library of books relating to the Pacific coast, out of which he intends compiling a complete cyclopaedia. His collection of books amounts to about 16,000 volumes, besides MSS., maps, and journals, which he is having indexed before commencing work on the cyclopaedia. The index alone is estimated to cost 10,000 dols.

A GEOGRAPHICAL Society has been founded at Lyons, independent of the Geographical Society of Paris, but with its full concurrence. It is proposed to encourage the formation of geographical sections in all the learned societies at present existing in the departments of France, and the example has been set by the Natural History Society of Toulouse.

THE Cretans, Mussulman and Christian, are anxious for the removal of their capital to Candia (Heracleion) from Canea, its present seat. During the period of Venetian domination, and long after the conquest of the island by the Turks, Candia was the capital; but it is objected that as a port that town is far inferior to Canea, and it is not expected that the Turkish Government will accede to the wishes of the Heraclioters.

WE have before alluded to the spread of education in Egypt. The Cairo correspondent of the *Levant Herald* speaks very highly of the energy of Riaz Pacha, Minister of Public Instruction, who is very wisely devoting his whole attention at present to the organisation of the primary schools.

OUR readers probably noticed in the daily papers of Wednesday last a telegram from Algiers, stating that a train arrived there on the 18th instant from Oran six hours behind time, the rails having been covered with a thick layer of grasshoppers. This was not a *canard*. General Chanzy has just issued a circular to the generals of division and prefects of Algeria on the occasion of the appearance of these pests in the subdivisions of Constantine and Batna, in which he recommends the systematic adoption of an expedient which has been employed with success in Cyprus, and also, but inconclusively, in Algeria, in 1868, 1869, and 1873. This plan comprises two distinct parts. The first consists of a systematic search for, and destruction of the grasshoppers' eggs, and is adopted in Cyprus and in the South of Russia, but of course with only partial success. In 1865 the Algerian chiefs were required to pay to the authorities a tribute of eggs, and it is now proposed that a price should be set on the creatures' heads, and that an insurance company should be set on foot to indemnify the victims of their ravages. The second part of the plan, however, as adopted in Cyprus, seems to yield the most satisfactory results; it deals not with the eggs, but with the crickets on the march. Before becoming a full-blown grasshopper, the cricket begins its wanderings about a month after it is hatched, and continues them for an average period of twenty-seven days, and it is in this stage that the attack has to be made. The crickets march in compact masses, and never swerve from a line of route on which they have once started. The Cyprians take a band of silk from 65 to 70 centimètres high, and 100 mètres long, which they tie vertically to poles firmly fixed in the ground; the upper part of the silk is waxed or bordered with oiled silk to a width of about 10 centimètres, and the earth is heaped up under it so as to leave no crevice between the silk and the ground. A second band is then set up, so as to form a sort of gallery of gradually diminishing width; at the mouth it is a little wider than the column of crickets, while the space between the two walls at the other end is only 5 mètres. At the further end is a trench 5 mètres long, $1\frac{1}{2}$ wide, and 1 deep. This trap is called a "system," and several systems each 100 mètres in length can be placed end to end, and transported to any point threatened by the invaders. When the column of crickets has once entered the gallery, all that has to be done is to wait till it reaches the trench, and when the trench is full it is covered in with earth, and nothing more is seen of the grasshoppers. The cricket has no wings to fly over the wall of silk, and if it climbs up to the waxed edge it slips back and falls to the ground. On arriving at the fatal trench it finds the edges lined with treacherous plates of zinc, on which it has no foot-hold, and it falls at once to the bottom. In 1868, 1,100 of these systems were used with effect in Cyprus, representing a mass of more than 7,000 cubic mètres of grasshoppers, and it is calculated that 1,100,000 grasshoppers were so destroyed. The peasants also had to bring in to the authorities a tribute of 27 kilogrammes of eggs apiece. If this system is energetically adopted in Algeria, the future prospects of the grasshopper cannot be said to be reassuring.

HER MAJESTY'S ship *Challenger* has arrived at Melbourne after a visit to the Antarctic regions. From a letter in the *Daily News*, it appears she left St. Simon's Bay (Cape of Good Hope) on December 17 last, and touched at the tiny dot in the map called Marion Island on Boxing Day. The island is of volcanic origin, but there are several streams formed by the melting of the snows. There were plenty of albatross here, and

the eggs (which they surrendered without a struggle, after obligingly allowing themselves to be knocked over with a stick) were pronounced excellent. A good haul of submarine wonders was made on the 20th, and several new specimens of starfish, cuttlefish, shrimps, and Venus's flower-basket were brought to light. Kerguelen Island was reached on January 7, and two fine sea elephants, measuring 12 feet long and 9 feet in girth, were shot. They here fell in with the *Emma Jane*, which had been to Heard Island, 300 miles south of Kerguelen, in quest of skins and oil. Two schooners and a barque are engaged in this trade from September to June, and during the winter season the barque returns to America with her cargo, while the remaining vessels cruise about Kerguelen in search of whales, twenty-nine men being left on Heard Island all the year round. But the whales and sea elephants were getting scarcer every year. After erecting a cairn with instructions for the Transit of Venus party, the *Challenger* left Kerguelen for Heard Island. Not a vestige of the supposed "Termination Land" was seen, and the party shaped their course for Melbourne, which they reached on February 17.

FROM a letter from a St. Petersburg correspondent of the *Times*, it appears that the young Grand Duke Nicholas Constantinovitch is prevented by illness from taking part in the Amu Daria expedition; the command will therefore devolve on Colonel Stoletoff. Major Herbert Wood, of the Royal (late Madras) Engineers, has been attached to it, as well as Severtsoff, a noted naturalist and traveller, who has been of late exploring the Tian-Shan range and the Naryn river; and M. J. Bogdanoff, a naturalist who visited Khiva last year. The chief object of the expedition is to make a careful survey of the delta of the Amu Daria and of the different channels of its *embouchure*. A steamer of light draught will be placed at the disposal of the party, to enable them to see how far up the river is navigable. The party will travel by way of Orenburg, Orsk and Irgis to Kazalinsk; the rendezvous, up to which point travelling is pretty easy, thanks to the relays of horses every 20 or 30 versts, provided by the energetic Baron van der Velde, chief of the postal department. But on reaching the Kara-Kum (black sands) desert, north-east of the Aral Sea, the wheels sink up to the axletrees at every step, and the real difficulties commence, both for men and animals. From Kazalinsk the expedition will work almost due south along the east shore of the Aral Sea to the Oxus delta, where their work will begin.

Two French scholars have recently devoted themselves to the discovery of the site of the Island of Atlantis. Unfortunately their conclusions are diametrically opposed. M. Roisel proves to his own satisfaction, in a work entitled *Les Atlantes*, that that favoured isle lies many fathoms deep beneath the mid Atlantic. The remembrance of the deluge which swallowed it up, as the priests of Sais related to Solon, is very widely preserved, and the Azores, the Canaries, and the Antilles are its last vestiges. This hypothesis is supported by the configuration of the bed of the ocean, and if adopted would satisfactorily explain the dispersion of the tertiary fauna and flora which has been long a puzzle to naturalists. Indeed, botanists have admitted it as the only plausible explanation of the analogy between the miocene flora of Central Europe and the existing flora of Eastern America, and it is further confirmed by the comparison of the insects and living and fossil vertebrata on both sides of the Atlantic. M. Roisel considers Atlantis to have been the mother-country of the modern world, and he traces the points of resemblance between the peoples of Central America, Africa, and Western Europe, to their common descent from the people of Atlantis. M. Moreau de Jonnés, on the other hand, whose work is entitled *L'Océan des Anciens et les Peuples préhistoriques*, places Atlantis beneath the waters of the Sea of Azof, and holds that the

Black Sea was the cradle of the modern world. The Atlantes, according to the testimony of Diodorus a highly civilised people, perished almost to a man in the convulsion which swallowed up their island; but a kindred people, the Hyperboreans, survived till historic times. The Amazons and antediluvian Athens found a place here; and Hades, Erebus, Tartarus, and the Elysian fields belonged to the same group of islands of which Atlantis was the most important. We gather from an article in the *Revue des Deux Mondes* that M. Moreau de Jonnés is somewhat lax in his etymological principles; while M. Roisel deprives his theory of some of the consideration to which it is undoubtedly entitled by attempts to reconstitute the scientific and philosophical doctrines of the primitive inhabitants of Atlantis.

From the *China Mail* (of Hongkong) we learn that Mr. J. B. Steere, an American naturalist, who is travelling in the East to collect specimens for the Museum of Natural Science at Michigan University, has just returned to Hongkong from a trip through Formosa. He spent six months in the interior of that island, travelling for the greater part of the time among the wild tribes of the aborigines. He succeeded in gathering with their aid a very interesting collection of natural objects, among which a collection of thirty-five different species of serpents forms a prominent feature. He also obtained a number of ancient manuscripts, which are being photographed by an amateur at Amoy. His investigations into the language of the aborigines resulted in a vocabulary of five different dialects of 200 words each, and prove conclusively that the language spoken by these aborigines is essentially Malayan, and stands in nearest relation to the dialects spoken in the Philippines.

A PLEASANT article on "Le Alpi e gli Alpini," in the May number of the *Nuova Antologia* gives an interesting account of the recent progress of Alpine exploration, and of the foundation and purposes of the Italian Alpine Club. This club was founded, it appears, in 1863, and now numbers 1,700 members; the headquarters of its sections are established chiefly in North Italian and sub-Alpine towns, though even Rome and Naples contribute their share, the section of the latter, founded in 1871, numbering 138 members. Though the English Alpine Club was the first association of its kind, its example has now been followed in Austria, Germany, Switzerland, and Italy, and, as we have before stated, an attempt to found a similar society has just been set on foot in France. An account of these various clubs, drawn for the most part, as the writer acknowledges, from the last *Bollettino* of the Italian Alpine Club, will be found in the May number of the *English Alpine Journal*. The writer in the *Nuova Antologia* would seem to be mistaken in ascribing the first ascent of the final peak of Monte Rosa to the "Professore Hulrich," in 1848; it is generally believed, at least in England, that the "Allerhöchste Spitze," called on the Federal map "Dufour Spitze," was first ascended in 1855 by Messrs. G. and C. Smyth, Hudson, Birkbeck, and Stevenson.

THE BRITISH MUSEUM. (Second Notice.)

WE resume our analysis of the Annual Return of the British Museum with an account of some of the most important additions made to the Department of Ethnography. Valuable illustrations of the ethnography of Africa, of Asia, of the Malay Peninsula and the Asiatic Islands, of Oceania and Australasia, and of North and South America, are enumerated by Mr. A. W. Franks. Perhaps the most interesting are those from North and South America; at any rate, we will select a few of them for notice here, as specimens of the articles in which this department of the Museum is

especially rich. They comprise, among other matters, a set of gambling sticks from the Northwest Coast; another set obtained at Metlakatla, British Columbia; a model of a Greenland kayak, harpoon and arrow, probably from the Aleutian Islands; and a model of a baby's cradle used during the process of flattening the head by the Saelies or Flathead Indians.

"Bow captured from the Modoc Indians after the 'Three Days' battle in the lava beds, April 17, 1873, from H. Wallace Attwell, Esq., Correspondent of the *Sacramento Record*. A valuable collection of objects obtained from the Indians of the lower part of the Ucayali River, Peru; an ancient Peruvian basket; a collection of Peruvian antiquities, including a very remarkable wooden 'chicha' cup, on which is incised in coloured mastic a subject representing the advent of the Spaniards, found in an Aymara grave, near Puno, Lake Titicaca; a small wooden cup in the hollow of which is sculptured a group of two oxen, yoked, and a gold disc, found in graves in the same locality; a bronze mace-head found at Sorata, five silver discs found in a grave at Huanacá, in the Lake Titicaca district; a painted terra-cotta vase in form of a warrior; a coil of silver riband, 1½ inch wide, from a tomb near Lake Titicaca; three modern Aymara flutes; 'ppassa' or clay used for mixing with food, by the Aymara Indians of the department of La Paz, Bolivia; two bone harpoon-heads, four necklaces, and part of a fishing-line made of seaweed, from Tierra del Fuego."

The Department of Coins and Medals has acquired a selection of thirty-two important Roman medallions, chiefly from the cabinet of the Count Tyeskiewitz. Some of them are of the greatest rarity. The medallions of Aelius, Gallienus and Salonina, Saloninus, Tacitus, and Constantius Chlorus are interesting for their portraits; and mythological interest attaches to those of Domitian, Hadrian, Aelius, M. Aurelius, Commodus, and Philip I. In the Mediaeval and Modern Series we note: A silver medal of Michael Mercator; a gold dobra of Fernando I. of Portugal, one of two known specimens, the other being in the Collection of his Majesty the King of Portugal; 519 jetons, or counters, of France and Germany; eleven rare bracteates of Miecslas III., King of Poland. In the English Series are—Proofs in gold of the Nightingale token and Till's Slough token; a pattern in silver of Droz's half-penny of George III.; and a gold medal of the Triple Alliance of 1609, and another of Charles I. with Henrietta Maria.

The number of specimens added to the Departments of Natural History in the year 1873 is 30,424. Of these, 10,644 are registered in the Zoological Department, 18,501 in the Geological, and 1,297 in the Mineralogical, Department. Among the most noteworthy in the first class of these Professor Owen places—

"The elephantine fossils from Malta, obtained by purchase from their discoverer, Leith Adams, Esq., M.D., F.R.S., representing a species of proboscidean mammal, of which the full-grown animal did not exceed the tapir in size. Another kind of extinct elephant, from the same collection and locality, may also be termed diminutive, as it did not exceed six or seven feet in height. Among the evidences of these pigmy elephants are series of the successive grinding teeth, from the first small and simple deciduous molar to the last great persistent molar.

"An ornitholite from the London Clay of Sheppey, obtained by purchase, proved, on removal of the matrix, to be the skull of a bird, with well-developed tooth-like processes from the alveolar borders of the upper and lower mandibles."

The last specimen was described in the *Quarterly Journal of the Geological Society of London* for November, 1873, under the name of *Odontopteryx toliapica*.

Specimens greatly extending our knowledge of the more gigantic forms of extinct marsupial animals in Australia, have been received in the past year through the liberal donations of Dr. George Bennett, of Sydney, New South Wales.

The Japanese Commissioners of the International Exhibition presented some curious speci-

mens illustrative of the metamorphoses and commercial productions of the silk-moths of Japan.

The most important acquisition for the Birds branch of the Zoological Department was the purchase of Mr. A. R. Wallace's collection of Malayan birds. This gentleman travelled in the various parts of the Malayan Archipelago during the years 1854-62, with the object of studying the natural history of those islands, many of which had never before been visited by naturalists, and are still most difficult of access to collectors. Directing his attention especially to the study of birds, he discovered many new and highly interesting forms, and elucidated their geographical distribution. An account of his travels, with their more important results, is given by him in his well-known work, *The Malayan Archipelago*. The collection contained a complete series of all the best specimens which Mr. Wallace was able to obtain, consisting of 2,474 examples, which represented about 1,000 species, and of which many were types or unique.

The collection of Hawks made by the same gentleman during his travels in the Amazons was also purchased. Specimens presented by various gentlemen from Egypt, the Bogos country, the Fantee country, the River Congo, Damara Land, Kattia-war, and other parts of the world, are also noted in the Return.

Among new Reptiles we observe forty specimens of North American freshwater turtles and terrapens, presented by the Smithsonian Institution, Washington; and a series of freshwater turtles and terrapens collected at Shanghai and Chefoo by R. Swinhoe, Esq., and containing two new species (*Oscaria Swinhoei* and *Emys unicolor*).

Mr. Swinhoe also contributed several large collections of freshwater and marine species, containing many new forms, to the Fishes branch of this department.

To the Mollusca is added a fine collection, made by Commander St. John, R.N., of 637 specimens from the seas of Northern Japan. This contains many new species, and is especially valuable on account of the information regarding the localities and depths at which the specimens were obtained by means of the dredge.

The additions to the Departments of Mineralogy and Botany are very important, but the lists of them given in the Return contain no particular specimens of sufficiently superior interest to the rest to require special mention here.

The Department of Prints and Drawings is the last to be noticed in this Return. By this upwards of ten thousand acquisitions have been made, including valuable donations by Mr. J. H. Anderdon, Mr. J. Deffett Francis, and Miss Tatlock. We also learn that upwards of twenty sheets of the third volume of the *Catalogue of Satirical Prints and Drawings* are in type. The entire volume will comprise numerous works by Hogarth, besides satires illustrating the opera, drama, players, the war with Spain, the fall of Sir R. Walpole's Administration, the biographies of George II., Whitefield, Admirals Vernon, Hosier, and Byng, the Duke of Cumberland, Pulteney, Cardinal Fleury, the Empress Maria Theresa, Pope, Cibber, Frederick the Great, the Pretender, Pitt, Lord Bute, and the Queen; also journalism of the period, "Mock-masonry," the Rebellion of 1745, the artists, and early exhibitions of pictures.

Mr. G. W. Reid, the Keeper of this Department, also announces that the first volume of the *Catalogue of Prints and Drawings illustrating Events in English History* will be issued without much further delay.

PARIS LETTER.

4 Place Wagram, Paris: May 19, 1874.

M. ALEXANDRE DUMAS' reception is again deferred, the new Academician has returned from Nice with his inaugural address unfinished—returned to the stage, the domain of his choice, and left the tribune vacant. He is generally credited with the possession of remarkable oratorical talents, though the epigrammatist and the rhetor is a rare combination; but it is nevertheless very probable that the eager hankerers after sensational ceremonials, who are already involving M. Patin in an inky sea of epistolary flattery, will prefer the Dumas of the famous *préfaces* to the wearer of freshly sprouted palms. M. Dumas is not averse to using his ink-bottle as a conjuror's goblet. He is addicted to surprises. He is reported to be meditating a novel, and straightway he issues a pamphlet on the political *choses du jour*; he is supposed to be revising his father's works, and just as a social scandal ending in murder has whetted the public appetite for a little pungent morality, "à l'usage des gens du monde," he frames a matrimonial code in fifty pages, ending with the exhortation "Tue-la!" M. Dumas is expected to be piquant and personal at the Academy; the expectation is a reason for his exhibiting himself correct and reticent—an Academician after the model of M. d'Haussonville, who will answer him. If he could but read the early preface of *L'Ami des Femmes*—which has been condemned for the second time—the most ardent lover of literary sensationalism would not be disappointed. The present preface has been pruned, corrected, and

toned down; but the primitive version might awaken some remorse in the minds of the Immortals. It contains this audacious paradox: "There are no immortal pieces, there are no indecent or disgusting pieces; there are pieces badly written, that is all." And further on M. Dumas sketches himself *l'ami des femmes*: "This person, who calls himself the women's friend as an antiphrasis, for he loves them as they do not want to be loved, with an affection that tells them home truths, has this one fault in the eyes of women: he knows his friends, but he is not the friend of all whom he has divined. The dominant planets in his horoscope are Jupiter, Apollo, and Mercury—in other words, gaiety, a love of gentle domination, a certain desire to please, intuition, observation, science, and cleverness in the utilisation of easy experiences and acquired proofs. An orphan in his early youth, under the guardianship of an old bachelor, that is to say, left to himself, he educated himself in that equivocal world born at about the same time as himself, which he has sometimes portrayed. He studied in *anima vili*, like a medical aspirant in the hospital and dissecting room, and these early experiences have given him that acuteness of vision, that frankness of execution which are the attributes of the Master, with a little of that contempt for the subject which is the result and perhaps the punishment of science." This is one of the Academician's essays that will be omitted from the complete library edition of his works. Unto that edition, however, is about to be added the first volume signed by the author of the *Dame aux Camélias*—a volume of verse printed in 1847, and entitled *Péchés de Jeunesse*. The book is dedicated to Alexandre Dumas in affectionate terms that contrast curiously with the bitterness of the playwright's more recent allusions to his father: "Read these few verses, and summon to my aid all your paternal indulgence. If they appear even then unworthy of you, inscribe them without scruple in the long list of the errors you have already pardoned me." The verses needed the indulgence of paternity; they were easy, not inelegant, but decidedly commonplace. The book has now utterly disappeared, albeit the author has since confessed that only fourteen copies were sold. Twenty years later the number would have been fourteen thousand; but then at that date M. Dumas *fil* was saying of Dumas *père*: "He would get up behind his own carriage to persuade you he possesses a negro footman," and complaining in public that to shake hands with his father invariably cost him a five franc piece. The *Péchés de Jeunesse* were rather more venial indiscretions.

Occasionally the sins in question—sins that take a printed metrical form at the desire of those "personal friends" who invariably prompt the publication of stillborn epics—appear to be worth committing from several points of view. They are very youthful indeed in the case of M. Maurice Bouchor, and seem likely to prove somewhat profitable. Some weeks ago a rumour went through the literary clubs, the salons whose frequenters are sufficiently old-fashioned to care for such things, announcing that a poet had been born unto France; that the people who were tired of hearing Victor Hugo called "Maitre" were about to receive ample satisfaction. The rumour had a substantial foundation. M. Maurice Bouchor has touched a chord that has not vibrated since De Musset died

reciting *Rolla*. His first volume is the first important literary event of this year. There was a personal interesting story attached to it. From a far provincial Boeotia a lad with a blunt peasant roughness about him set out for the Paris of M. de Broglie's Republic—not a poet's Utopia—with the legendary budget of rhymes in his portmanteau. It was not a promising commencement; he had predecessors by the hundreds whom Boemia, Grub Street, and the reporters' galleries have engulfed, whose early lyrics serve but to line the boxes on the quays. Those of M. Bouchor were published immediately; a gallery of critics and Maecenases applauded him. Three days after their publication the *Chansons Joyeuses* were famous—and their author is just eighteen. Before that fact criticism is in a measure disarmed; but were the circumstance unknown it would be difficult to deal hardly with the tender, generous, and genial volume M. Bouchor has given us. The author of *Chansons Joyeuses* does more than promise a poet of genius; his first work can stand alone, independently of what may come after. It is a series of frank and joyous lyrics celebrating wine, love, and song, as lyrics written at eighteen should do. They affect a certain Rabelaisian sentimentality that has had no apostle since Béranger; they couple wine and lips and roses rather too frequently, but there is a hearty ring in the repetitions that neutralises whatever may be commonplace in the idea. M. Bouchor is the precursor, the prophet of a "human" school; he marches with the vanguard of the century hopefully, lustily. To the impassible, petrified school of Parnassiens he throws this anathema:—

"Vous ne voulez pas être applaudis par les masses;
Et solitairement vous planez dans les cieux!
Pour vous montrer à nu, moi qui hais les grimaces,
J'irai bien relever votre robe de dieux!
L'on vous verra claquer des dents, mornes et pâles,
Maigres à faire peur et tout roués de coups;
Et quand vous chanterez, il sortira des râles
De ces tambours crévés qui sont vos cœurs, à vous!"

The lad who in his eighteenth year has penned some hundreds of lines as musical and vigorous as these has already surpassed De Musset.

M. Bouchor is a democrat of a very advanced type, and the advice perhaps is superfluous; but the enthusiasts who surround the young poet should save him from one thing—the *Figaro*. It is to be hoped that M. de Villemessant's *Memoirs of a Journalist* are studied attentively. They are unique in literature—even the pleasant piquant Parisian literature typified by the *Memoirs of biches Anglaises* and *cocottes Russes*. Frenchmen are accustomed to be lenient towards M. de Villemessant for the scriptural reason, *quia multum amavit*. And that is the plea the impresario of the *Figaro* puts forward incessantly. The catalogue of his charities is apparently inexhaustible; the spirit in which it is compiled is indescribable. Five columns of the *Memoirs* are occupied by an account of the sums lent or paid to divers journalists whose ingratitude was demonstrated by the fact that they refused to adopt monarchical opinions in obedience to the benefactor's request. He enumerates a few francs lent to Pelloquet, a former contributor to the *Figaro* fallen into poverty and imbecility; the thousand francs paid to Pascal Grousset for a feuilleton; the money lent to Duchesne to save his son from the conscription; the twenty-four thousand francs that constituted Jules Vallis' salary, the *gratifications* accorded to Henri Rochefort, &c. Each item is published

as a proof of M. de Villemessant's benevolent prodigality. Each of the writers he names increased the circulation of his journal by many thousands, but it is always as an act of charity that the editor regards their engagement. And the recipients are made to pay dearly for the favours accepted. The frankness of M. de Villemessant's chronicles is their most attractive feature in all probability, for they have no merit of style or spirit. He spares nobody. He proclaims to the world that Vallis' boots lacked the lustre of respectability; that Victor Noir manifested a culpable negligence in cravats and orthography; he describes the domestic troubles of Duchesne; the malady of his son-in-law, the financial situation of M. Ranc. He is severely moral concerning Rochefort's frequentation of the gambling tables of Baden and Spa, and ignobly jocose on the subject of some personal infirmity of his former friend which need not be named. His principal grievance against the writers he calumniates is this: M. de Villemessant's most brilliant writers have been Republicans—and the Republican press has never employed monarchical journalists. It has not occurred to the representative Figariste, that if Republicans were engaged on the *Figaro*, it was because their equals could not be found in the royalist camp; and if liberal journalism is not recruited from reactionary ranks, it is because liberal talent suffices. M. de Villemessant declares that he has never heard of a Conservative writing in a Republican journal. The press that possesses Louis Blanc, Pelletan, Vacquerie, Sarcey, About, Lockroy, Schoelcher, Legouvé, is not in absolute need of MM. Saint-Genest or René de Pont-Jest.

The *Memoirs of a Journalist* are to extend over ten volumes, and the elaborate libels will assuredly be more popular than another species of Memoirs to appear in the autumn. J. P. Proudhon has left an enormous budget of private correspondence. The eminently literary temperament, the vigorous restless mind of the great economist found relaxation in the vast correspondence he maintained with stranger and friend. He would meditate, remodel, and amend a chapter on the currency question or the philosophy of art during eight or nine hours—and afterwards write as many letters for his private pleasure. Twenty lines addressed to him, no matter by whom, were sure to elicit a response of ten pages. Reticent and embarrassed in conversation, he was a brilliant and fascinating *causeur*, pen in hand. "Je ne cause qu'à l'encre," he said humorously. The eight forthcoming volumes of unpublished correspondence will exemplify better perhaps than any other portion of Proudhon's work the marvellous range of his knowledge, the breadth of his sympathies, the vividness and versatility of his style. His letters to Prince Napoleon (Jérôme), already published, show sufficiently that his irony was frank and fearless, aiming boldly at Caesar before Caesar's cousin. The promised correspondence will form a gallery of contemporary portraits, painted by the shrewdest satirist of his epoch, a vast pillory from which few modern celebrities will escape.

We are threatened with an avalanche of sonnets. With the cultivation of melons, the collection of postage-stamps and the invention of republican constitutions, the chiselling of those fourteen lines, "qui valent un long poème," is the last innocent mania that may be called essentially French. It will be indulged in during the cur-

rent year to an unprecedented extent. An *Almanach du Sonnet* will be published in the winter under the auspices of those inveterate offenders, the Provençal poets. An appeal to the "Sonneteers of Europe" has been issued; and if M. Arsène Houssaye responds, the result will be a volume obese as a directory. Single-handed, M. Houssaye has just issued a collection of *Cent-et-un Sonnets*, redolent of roses and *poudre à la maréchale*, like most of his productions. And yet there are occasional evidences in the collection that, had it not been for that fatal facility which has rendered M. Houssaye during twenty-five years the most prolific writer in France, the author might have achieved real distinction as a minor poet. There was much picturesque talent in the *Sentiers Perdus*, but it has been frittered away in flimsy art criticism, in easy antitheses, and harmless epigrams. While M. Houssaye *père* is writing sonnets, M. Henri Houssaye, a scholar of a very different stamp, is studying, in the *Temps*, the "Topographie des Enfers Classiques," after Virgil.

The translation of *Prince Florestan of Monheco* is beginning to excite commentators and critics. The Parisian reviewer awakens very slowly to an idea that anything worth his ink has been yielded by English literature. Some six weeks ago a *feuilletoniste* noticed *Middlemarch* as a new novel. *Prince Florestan* has been compared with *Rabagas* and Legouvé's satires; and the English pamphlet is allowed to bear the comparison well, without paling or dwindling.

EVELYN JERROLD.

CORRESPONDENCE.

THE WORD "ROSE."

Oxford: May 18.

Mr. Le Page Renouf's statement that the word *uarta* occurs in Egyptian as far back as 1300 B.C., is very valuable; it will become still more so, if he can prove that *uarta* in Egyptian means a rose. In the meantime his conjecture that the word *uarta* is an Aramaean importation in Egyptian may be accepted, and no one would venture to contradict him when he adds that "for aught we know, the original form of the word may be Accadian." None of these facts or theories, however, affects in the least the question which was discussed, and, as I thought, brought to a satisfactory conclusion, between Professor Wright and myself. There is the most perfect agreement between us on all essential points, and I do not see that Mr. Le Page Renouf has controverted a single one of the facts or conclusions on which we relied. Professor Wright has shown that the Arabs, and he himself among them, have a feeling that *ward* is a native Arabic word. He has likewise shown that the Turks borrowed the word from the Arabs, and that neither Turks nor Arabs were aware that they were using a word of Persian, i.e. Aryan extraction. Very interesting, too, was his statement that "some of the Arabian lexicographers had a suspicion that the word was not genuine Arabic, but only *mu'arrab*, or Arabicised, and all was settled, so far as I could see, by Professor Wright's admission that the word *ward*, though thoroughly Semiticised, came very probably from an old Persian word, *vareda*.

When I said that *ward* in Turkish is a Persian, i.e. an Aryan word, my object was to show that *ward* in Turkish ought not to have been treated as a word of Turanian origin, and compared with Suomi *varti*, blood; that its true roots lay in Persia, not in Siberia, and that, however it may have travelled, its original home was Aryan. If it were a question whether a word like *haranguer* is of Teutonic or Italic origin, everybody would admit that in English the word is taken from

French; but if anyone were, on the strength of that admission to compare the French *haranguer* with the Italic *hariolari*, he would have to be told that *haranguer* is a Teutonic word, both in French and in English, and connected with the Old German *hring*, the English *ring* in *ring-leader*, and that on phonetic grounds too, it can have nothing common with an Italic word beginning with *h*. Exactly the same applies, *mutatis mutandis*, to *ward* in Turkish, Arabic, and Persian. The fact that we have both *ward* and *gul*, as names of rose, would be sufficient, I think, to show that we have before us a Persian word, because the phonetic rules according to which *ward* becomes *gul*, are Persian and Persian only, and would hardly apply to foreign words in Persian. In the Pehlevi-Pazend Dictionary, *vartā* is explained by *gul*, the former being, according to the very nature of the dictionary, the Pehlevi or Huzvareh or Semitic, the latter the Pazend or Aryan form. The Pehlevi form *vartā* is, therefore, like the Aramaic *vardā*, a Semiticised form of the Persian original.

That the Persian language has borrowed to an enormous extent from Arabic is certainly notorious, but it is equally well known that Arabic borrowed Persian words (*Lectures on the Science of Language*, 7th ed., vol. i., p. 86, seq.), and, unless Mr. Le Page Renouf produces evidence to the contrary, *ward* may, I think, in future be classed as one of them.

If, finally, Mr. Le Page Renouf thinks that he could easily find an Egyptian derivation for *ῥόδον* in the root *rut*, to grow, he forgets that we have to explain, not *ῥόδον*, but the more primitive Aeolic *ῥόδον*, and that the labial initial in Greek can be explained by the Zend *vareda*, but not by the Egyptian *rut*.

MAX MÜLLER.

THOMAS WINDEBANK.

Bottesford Manor: May 18, 1874.

Mr. Masson is mistaken in identifying (see *ACADEMY*, May 16, p. 537, col. ii.) Thomas Windebank, who wrote the letters from which he quotes, with the unfortunate governor of Blechingdon House.

This Thomas, or Sir Thomas—for he seems to have been a knight or baronet, it is not quite certain which—was the eldest son of Sir Francis Windebank, Secretary of State. He is almost certainly the "Thomas Windebank, Esq.," who represented Wootton Bassett in the Parliament of April 13, 1640. In 1660 he was still alive and beyond sea.

Francis Windebank, the governor of Blechingdon House, who surrendered his charge to Oliver Cromwell, April 24, 1645, was a younger brother of this Sir Thomas. The articles under which the fortress was yielded may be seen in Rushworth. I have seen no evidence that he was either a traitor or a coward. Royalist writers, when speaking of his unhappy fate, generally seem to think some excuse is needed. Heath, who gives the Cavalier view of things, blames his wife for what happened. He says:—

"The governor, over-ruled by his fair young Bride, and some Ladies that were comethither to visit, and frighted with the menace, delivered the House, with all the Arms and Ammunition therein. For which the hopeful young Gentleman, for all the prayers and intreaties of his Wife, and the merit of his Father, was shot to death against Merton Colledge Wall in Oxford; to the great regret afterwards of the king, when he understood the business, and for which he was highly displeased with Prince Rupert."

There seems to be some doubt as to the exact spot where the execution took place. Sir William Dugdale, who was in Oxford when it happened, says that Colonel Windebank was "shott to death . . . within the garden at Oxford Castle." Wood tells us that the deed was done in "Broken hayes near Oxon." Colonel Chester informs me that the burial register of Saint Mary Magdalen, in that city, bears testimony that Windebank

was buried there on May 3—the day of his execution.

Sir Francis Windebank had two other sons, John, M.A. Oxon, created Doctor of Physic April 5, 1654, who afterwards practised at Guildford; and Christopher, sometime of Magdalen College, Oxford.

EDWARD PEACOCK.

THE SITE OF TROY.

Cambridge: May 18.

A writer in the *Standard* of May 1, referring to my letter in the *ACADEMY* of April 18, appears to argue that it is no longer of any use to contend that the Homeric Ilium stood on the high ground of Bounarbashi, the town of the warm and cold springs, since positive proof has now been produced that Hissarlik, the *Ilium Novum* of the post-Alexandrine and Roman traditions, was the true ancient site. The suggestion that the Troy of the oldest poets was a mythical city he treats with contempt, as an old-fashioned and long exploded idea. If the readers of the *ACADEMY* are not tired of the discussion, I should like to add a few more words on a subject on which certainty is unattainable, though reasonable conjecture may be allowed to have some weight.

If any persons take pleasure in believing that the Troy which was built by Apollo and Poseidon, captured by Hercules, and was ruled over by a king who was the brother of the hoar Sun-god Tithonus, the husband of Aurora, had a real geographical site, they are of course entitled to retain their very harmless opinion. Precisely the same may be said about the personality and identity of the Homer to whom so vast a collection of epic poems was attributed by an uncritical antiquity. Many good scholars question the existence of both. Yet, as no one denies that there must have been some "Homer," since we have an *Iliad* and an *Odyssey*; so there must have been, under the same conditions of doubtful identity and uncertainty of name, a real "Ilium," that was destroyed by fire, for we have found its ashes. But there are several sites in the Troad of undoubtedly very ancient cities, any of which may have been connected with the Trojan legends. It is certain that in very early times there was a dim tradition of a city on the banks of Scamander (both Aeschylus and Pindar say thus much), which was the scene of a great conflict, and was finally taken and burnt to the ground. All the accounts expressly dwell on its destruction by fire; and so far the "crust of red ashes and calcined ruins" found by Dr. Schliemann is a coincidence of very great interest. Now, though it is pretty certain that the Trojan legends are largely made up of Lycian tradition, and this very "Scamander" may have originally meant either the Xanthus of Lycia, or the Xanthus of the Troad—just as the *Troes* may or may not have been the founders of the Lycian city *Tlos*—still it is on the whole probable that the story of the Trojan war (even if in its remotest origin it was purely a solar myth) found a real centre of action, so to say, in some city in the Troad of immense, perhaps long prehistoric, antiquity. This mixture of the supernatural with early human achievement—this localising of floating traditions, obviously presents no serious difficulty. Achilles may have been the mid-day sun, and Odysseus the setting sun, the *δυόμενος θεός*, and yet they may in some sense record the deeds or represent the characters of real men. There may have been a great flood even in the plain of The-

sealy, and yet the story of Pyrrha and Deucalion is not the less a myth. There may have been a Troy, or an Ilium, whose actual site was long forgotten when the epics about the Trojan war were first composed in Greek. But it seems certain that the "Homer" of Pindar and Aeschylus—generally, indeed, of the tragic poets—and of the vase-painters of Trojan subjects in the fifth century B.C., was some one very different from the great epic composer who has bequeathed to us the *Iliad* in its present complete and dramatised form, though he was still called "Homer" quite as a matter of course. The language of that poem is, in the main, of the age and the country of Herodotus, mixed up largely with archaic and pseudo-archaic words and inflexions. When the author or compiler of it, who evidently had personally visited the site and scenery of Bounarbashi, lived, the Aeolic colony of "Old Ilium" must have been built; for this is the only reasonable explanation that can be put on the words in *Iliad* xx. 216, that "sacred Troy had not as yet been built in the plain, but they still dwelt on the slopes of Mount Ida."† It was the upper city, with its Pergamus or Acropolis, that he regarded as the Troy of the siege. This alone could be called *αἰπεινή*, "the high town." Strabo, xiii. 25 (p. 593), records the opinion of some writers "that the city had changed its site several times,"—*πλεῖσιν μεταβιβάσκειν τόπους τὴν πόλιν*.

In a word, no one definite site was assigned by the early poets to the Troy of the oldest tales. They spoke of a place, in the true spirit of myth, which they had never seen, and knew nothing about.

If the city, or rather succession of cities, discovered by Dr. Schliemann be really of immense antiquity, it is very likely that this was one of the earliest sites or "local habitations" of the legend. But, then, it must have been long forgotten as such when the *Iliad* as we now have it was composed; for it is clear that the author of it founded his poem on a different conception of the scene.

I think, therefore, that the divinely built city of pure myth, existing only in poets' brains; the city of the prehistoric siege and capture, possibly that now so wonderfully unearthed by Dr. Schliemann, and the city of Pergamus, the Scaean Gate, and the warm springs, as described by the bard whom I have learnt, after investigating this question for many years, to call "Our Homer," may be allowed severally to have their proper place in the inquiry.

The weak point in the claims made for Dr. Schliemann's discoveries seems to me to be the attempt to associate them with King Priam or any of the Homeric heroes, or to identify them with any forms of art described in the *Iliad*. Let them stand for what they may fairly claim to be, genuine and unique specimens of very early civilisation. But it is making an unfair use of their evidence to prove from them that Hissarlik was the true site of the Homeric Ilium, against the plain description in the poem itself. My own impression, from a careful perusal of Sir William Gell's *Geography of the Troad*, is that he has fully proved his point in fixing the real scene of the *Iliad* at or near Bounarbashi. To my mind his arguments are unanswerable; and I say this wholly unconscious of any "love of paradox," with which the eloquent writer in the *Standard* charges me.

F. A. PALEY.

THE annual meeting of the London Library was held on Thursday, Lord Houghton in the chair. The vice-presidency, vacant by the death of the Bishop of Winchester, was filled by the election of the Dean of Westminster; Mr. T. Walrond, C.B., and Mr. Leslie Stephen were placed upon the Committee.

* I now affirm as a fact what I hope soon to be able to demonstrate.

† I go so far as to say that *Od.* vii. 81 must allude to the temple of Erechtheus built on the Acropolis of Athens in the time of Pericles.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, May 23,	1 p.m.	Sale at Christie's of the Collection of Modern Pictures of J. S. Forbes, Esq.
"	3 p.m.	Royal Institution: Mr. R. A. Proctor on "The Planetary System."
"	"	Crystal Palace: Second Summer Concert (French Music).
"	3.45 p.m.	Royal Botanic.
MONDAY, May 25,	3 p.m.	Linnean: Anniversary.
"	"	Ballad Concert: Royal Albert Hall.
TUESDAY, May 26,	3 p.m.	Royal Institution: Mr. W. H. Stone on "The Theory of Musical Instruments."
"	8 p.m.	Civil Engineers' Anthropological Institute.
"	"	Madame Favart in <i>Le Post-scriptum</i> and <i>La Nuit de Mai</i> at the Princess's.
"	"	Colonial Institute: Mr. F. Young on "New Zealand, Past, Present, and Future."
"	8.30 p.m.	Royal Medical and Chirurgical.
WEDNESDAY, May 27,	1 p.m.	Horticultural.
"	8 p.m.	Society of Arts. Geological. Archaeological.
"	"	Royal Society of Literature: Mr. C. H. E. Carmichael on "Vernese Typography (XVth to XIXth Century)."
THURSDAY, May 28,	3 p.m.	Royal Institution: Professor Story Maskelyne on "Physical Symmetry in Crystals."
"	"	Middle. Krebs' First Piano Recital (St. James's Hall).
"	8 p.m.	Society of Arts: Third Convocation.
"	"	M. Got in <i>Le Gendre de M. Poirier</i> at the Princess's.
FRIDAY, May 29,	3 p.m.	Halle's Fourth Recital (St. James's Hall).
"	"	M. Duvernoy's First Piano Recital (Hanover Square Rooms).
"	9 p.m.	Royal Institution: Dean Stanley on "The Roman Catacombs as illustrating the Belief of the Early Christians."

SCIENCE.

The New Chemistry. By Josiah P. Cooke, Erving Professor of Chemistry and Mineralogy in Harvard University. (London: Henry S. King & Co., 1874.)

CHEMICAL Science now constitutes a system which is so vast that it has many subdivisions:—Theoretical Chemistry, Technical Chemistry, Practical Chemistry, Analytical Chemistry, and so on. In each of these branches there are many hundred workers, and as a consequence the science is, in the main, made up of well-established, and, as far as we can make them, absolute, facts. Hence, when we speak of the "New Chemistry," it is obvious that the term cannot apply to new facts, but rather to the manner of viewing old facts in relation to their surroundings. The New Chemistry is not a new system of practical chemistry, but of theoretical chemistry: it is a new chemical philosophy; and having for its basis established facts, it reacts, by its generalisations and deductions, on the more practical side of the science, and indicates the direction in which we are to look for other and at present unknown facts. The New Chemistry has been principally developed during the last ten years; Dr. Hoffmann's *Modern Chemistry* (1866) was the first important treatise published in this country on the subject, and hitherto it has been unsurpassed by any later work, in conciseness, clearness, and logical accuracy. A main difference between the chemistry of 1854 and that of 1874 is this: that in the former *weight* was regarded as the prin-

cial factor which regulates the combination of all bodies solid, liquid and gaseous; while in the latter we regard combination by volume as the truer mode of action, and prefer to determine first the volumetric relations of bodies, then their weights.

Professor Cooke tells us that the starting point of the new chemistry is the law of Avogadro, which "holds the same place in chemistry that the law of gravitation does in astronomy," and which may be thus enunciated:—

"Equal volumes of all substances, when in the state of gas, and under like conditions, contain the same number of molecules."

This law is indeed of fundamental importance, but we deny that it bears the same relation to chemistry that the law of gravitation does to astronomy. In the first place, the law of Avogadro does not submit itself to the same absolute proofs as the law of gravitation, and it is of far less general application; again, it is of a more theoretical nature—and we say this fully cognisant of the fact that Neumann has recently deduced the law mathematically from the mechanical theory of gases. If any law in chemistry is to be compared with the law of gravitation, it should surely be the law of chemical affinity.

After the law of Avogadro, Professor Cooke places the law of Boyle, and the law of Charles, which respectively assert that—

"The volume of a confined mass of gas is inversely proportional to the pressure to which it is exposed: the smaller the pressure, the larger the volume, and the greater the pressure, the less the volume."

"The volume of a given mass of gas under a constant pressure varies directly as the absolute temperature."

The author then applies these laws to the explanation of combination by volume, and constructs suitable symbolical expressions both for simple combinations, and for replacements. These three laws, which are closely connected, "define the æriform condition of matter:" thus the first tells us that if a given volume of hydrogen contains a certain number of molecules under a given temperature and pressure, an equal volume of oxygen, nitrogen, &c., will contain the same number of molecules. Sir William Thompson has calculated that a perfect gas at 32° F., and 30 inches barometric pressure contains 10^{23} (or a hundred thousand million million molecules) to the cubic inch. The second law (Boyle's) asserts that if you take any given volume of gas, say 100 cubic inches, at a given pressure, and double the pressure the volume is reduced to one-half (viz. 50 cubic inches); if the pressure be trebled, the volume becomes one-third (viz. 33.33 cubic inches); if quadrupled, it becomes 25 cubic inches; if increased a hundredfold, the volume will be reduced to 1 cubic inch. The third law asserts that at the absolute zero of temperature (-273° C.), gases have no motion, no heat, no energy, at 0° C. they will have a certain amount of energy, at 273° C. twice as much, that is, their volume will be doubled if free to expand, and the pressure will be doubled if confined; at 546° C., three times the volume, and so on.

Scattered throughout the work we find

concise definitions which are of great importance to the student, and are for the most part exact. The following are examples:—

"Density is a weight, while specific gravity is a ratio" (p. 68).

Molecules are defined (p. 86) as

"The smallest particles of a substance in which its qualities inhere, or the smallest particles of substance which can exist by themselves."

As to relative weights, we are told, p. 66:—

"It is obvious, if equal volumes of two gases contain the same number of molecules, the relative weights of these molecules must be the same as the relative weights of the equal gas volumes."

We must attribute great inconsistency to our author, when we find him asserting that Newton's law of universal gravitation is "the basis of modern chemistry, as much as it is of modern astronomy." For he has before called the law of Avogadro the fundamental law of the new chemistry, and defined its position in chemistry as similar to that of the law of gravitation in astronomy. Again, he speaks (p. 129) of the hydrogen atom as "the smallest mass of matter known to science," when he should surely say the *lightest*. In a chapter on "Chemical Reactions," we find the heading "Chemical Arithmetic," and the following rule: "As the total molecular weight of the substance given, is to the total molecular weight of the substance required, so is the given weight to the required weight." This Professor Cooke calls "the Golden Rule of Chemistry," but, in good sooth, it is simply the ordinary Rule of Three. In the general classification of chemical changes, it is, we think, to be regretted, that volume-squares, now common in all our text-books, have been omitted. They are of great service to the student by enabling him to see at a glance the condensation of compound gases; and any one who remembers how effectively they were used in Dr. Hoffmann's *Modern Chemistry*, will regret the omission here.

A long paragraph (pp. 195–196) treats of the "Method of Science," and shows how we find out the true causes of phenomena by eliminating conditions which are common to two parallel sets of experiments made in relation to the said phenomena, and then specially test the bearing of the conditions which differ. Thus sulphur burnt in oxygen produces very little light, while phosphorus burnt in oxygen produces a very intense light; the only notable difference is the fact that the phosphorus flame contains a number of solid particles, while the sulphur flame contains only gaseous particles. Hence, if we introduce solid particles into the sulphur-flame, it ought also to be luminous, which being tried proves the truth of the explanation. Professor Cooke, adds:—

"This method of differencing phenomena as a means of discovering the cause of effects which are prominent in one, although common to both, is frequently called differentiation, and it is one of the most valuable methods in science."

But more than two centuries ago, Lord Bacon, who proposed this method, called it *Instantia Crucis*, and surely, if we omit the name of the man who suggested the method, we should, at least, in common fairness, call it by its old and recognised name.

The latter portion of the work treats (rather fancifully, we think) of the internal constitution of complex molecules, and of an electro-chemical theory or hypothesis, which is ingenious as a speculation, but no more. The book will, however, repay perusal; it contains much sober thought, some concise definition, a considerable leaven of theoretical matter, and some ingenious fancies. There is not much new matter in it, but the old is worked up into a readable form, and many portions of the book are eminently suggestive to the student.

G. F. RODWELL.

Transactions of the Asiatic Society of Japan.
From October 30, 1872, to October 9, 1873.
(Yokohama, 1874.)

THIS is the first issue of the Society's Transactions, and it represents the quiet and studious side of foreign life in Japan. Just now the newspapers bring rumours of internal commotion, and the residents in Nagasaki were by recent accounts preparing to take refuge on board the ships of their various nationalities. This publication belongs to the time of calm which followed the revolution of 1868, and has continued till now. Yokohama is close to the seat of government, and it is not likely at present that the rebellion will spread to its vicinity, so as to disturb that spirit of repose which breathes through these Transactions. We may hope that the quelling of the insurrection in Sagas on March 1 will secure peace to the country generally for some time to come at least.

Our best Japanese scholar, Mr. Satow, has contributed two careful papers, one on Loochoo, and the other on the Geography of Japan. As Japanese life and institutions are a reproduction of those of China on a smaller scale, so Loochooan life and institutions are a reproduction of those of its great neighbours China and Japan on a very much smaller scale. So true is this, that all the three religions of China are found in Loochoo. The preference of the Loochooans is, however, while in many things they copy Japan, for the usages of the Chinese, who have never conquered them as the Japanese have done. They have, as might be expected, peculiarities of their own, but they are disappearing. Formerly, when a Loochooan died, he was provisionally buried for three years. The bones were then exhumed and washed with an alcoholic liquid, after which they were placed in a vase and deposited once more in the tomb. Some of the Miau tribes in south-western China have also the singular custom of washing the bones of their ancestors on certain occasions. The Buddhist mode of burial has been adopted in Loochoo of late years, as in Japan. The body is placed sitting in a coffin of a cubical shape. It is then carried in procession to a Buddhist temple, where the priests, who had walked before it, chant a sort of litany in the presence of the idols in the chief hall. The coffin is then borne away to the grave unaccompanied by the priests or the mourners. I witnessed a funeral of this kind in Yokohama last summer. The son of the deceased and the women of the family, all clad in coarse white cotton cloth, threw many dozens of bags of pastry among the numerous lookers-on who crowded to the temple doors. Here was the charity of the Buddhist religion. The inscriptions on the brilliant blue and yellow canopy which overhung the coffin expressed the Buddhist idea of victory in death, in the extermination of the five evils, and elevation to the dignity of Buddha. This is an illustration of the way in which in Japan and Loochoo the idea of death presents itself to the meditative Buddhist, whether monk or layman.

The Loochooans were originally a Japanese colony, as their language shows.

In the paper on Japanese Geography, the errors

of English school-books are exposed. A great part of what is taught to our youth on that subject is shown to be wrong. Compilers of books to be used in schools have too often contented themselves with blind citations from incompetent authors, when, as in this case, correct information on the subject was difficult to be got at. To make this known is a great service done to the public. For example, Nippon is only another and older way of spelling the word Japan, and is applied by the natives to the empire, and not to the largest island of the group. All books and maps which call the chief island Nippon, Nihon or Nippon, are wrong. To the native mind, the mainland of Japan needs no name, just as to the Orcadian the mainland of Orkney needs no name.

The author finds several faults with the section on Japan in Cornwell's *School Geography*. It is not true that few domestic animals exist in Japan. There at least cows, horses, dogs, cats and poultry. Lately the Japanese have made a vigorous effort to introduce rabbits from China. Sheep and donkeys abound in North China and in Mongolia, where the soil and air are dry. In Japan they cannot be acclimated, evidently on account of dampness and the want of suitable grasses. Dr. Cornwell is quite wrong in saying that Japan is deficient in timber. He certainly was never there. Timber abounds, except in the neighbourhood of Nagasaki. Houses and temples are built of it in all parts of the empire, as every traveller in the country knows. Sadly do the houses in Yedo and Osaka need paint to relieve the dull and gloomy aspect of wooden architecture. It is a wonder that the Japanese in this respect do not copy the Chinese love of colour. But to paint a whole house would of course be expensive. The Chinese always fill up their wooden framework with brick walls. The pillars are painted red or black. The interstitial walls are plastered white, blue, or red. The Chinese have everywhere abundance of lime and blue and red clay to furnish these colours. In Japan, lime is scarce. Dr. Cornwell has also been negligent in his account of Yedo; of the great bronze Buddha, which was, in the seventeenth century, coined into cash to meet the exigencies of the public service; of the mode in which the government is conducted; of the mode in which foreign goods are paid for by the Japanese; and of the numbers killed in the last great earthquake in Yedo. These form a heavy list of errors to be found in one common English school-book on geography, and they are not all. What errors may occur in other works, Mr. Satow does not say. There can be little doubt that there is much need in them for correction and expurgation. No one can say that the Asiatic Society of Japan is not doing useful work in drawing attention to this subject.

Professor Griffis, in his paper on Street Names in Yedo, alludes to the absence of self-glorification in these names. They are not memorials of victories and battle-fields. Out of 1,371 streets in Yedo (or rather Tokei, the eastern capital, as it is now to be called), two-thirds have been derived from natural objects. They have Willow Street, Stone Street, Bamboo Street. The "pine" is varied by the words "front," "side," "little," "young," "new," "temple-facing," and "hill-facing." The morning sun, the mist, the well, the mountain, all furnish names to thoroughfares. They have Leather Street and Indigo Street, Kitchen Street and Charcoal Street, Bear Street and Falcon Street. But proper names of men and places are not found. "The streets in Yedo are in general wide and spacious, and are kept well repaired. They are usually straight, and run between opposite cardinal points of the compass. Within the castle, which covers a vast space in the centre of the city, the avenues, especially along the moats, were originally made for the grand spectacles of feudal lords and their retainers. The Daimios' trains no longer glitter there to impress the mind of spectators with scenic effect; but the wide avenues on which these glories of a bygone age were once witnessed,

still remain to adorn the great city which is the capital of new Japan."

Natural history is represented by a careful article on the Glass Rope Sponge of Japan. There is an elaborate article on Typhoons in Japanese Seas, and a brief one on the Descents of Russia on Saghalien.

The last article is upon the Nature of the Japanese Language and its possible Improvements. The connexion with Mongol, Manchu, Turkish, and Tamil is shown by identity in the laws of position and common roots; and it is stated that the rigour with which the verb is forced to the end of sentences amounts to a restriction on intellectual freedom, causes a cramping of poetic genius, and prevents the development of popular eloquence. On this and other grounds it is referred to the foreign educators in Japan for their consideration, whether it is possible to improve the laws of the collocation of words in Japanese, by introducing modifications into the system of government education now being organised. The Japanese have already expressed dissatisfaction with their own language, and if we can help them to improve it, we ought to do so. It was by education that formerly they succeeded in naturalising many thousands of Chinese words and expressions, which, like exotic plants, have learned to grow and bear useful fruit in a new climate. Cannot the educator do the same thing with the laws of the collocation of words that he does with words themselves, and thus contribute his aid to improve the languages of inferior races, and help them to attain the intellectual eminence of their more highly-gifted contemporaries?

JOSEPH EDKINS.

NOTES AND NEWS.

A Certain and Immediate Sign of Death.—The signs of death which can be implicitly relied upon, even by medical men, are comparatively few. Consciousness may be abolished, the pulsation of the heart may be inaudible and imperceptible to the touch or eye. The respiratory movements may be inappreciable, the surface may feel cold, and yet life may not be quite extinguished. It has recently been suggested as a good method of general application, to tie a piece of twine rather tightly around a finger. If after a few minutes the part beyond the ligature neither swells nor alters in colour, life may be regarded with tolerable certainty as extinct. In a recent contribution to this subject, Dr. Leon Danis (*London Medical Record*, No. 67) has proposed another plan, which, however, can only be practised by a surgeon. The plan proposed by Dr. Danis is the denudation and section of an artery. If the artery be empty, the heart is dead; the heart dead, the whole body has ceased to live. The great advantage to be derived from the employment of this sign is, that the emptying of the arteries must be simultaneous with death, and if it be present, attempts at restoration should be abandoned. If this phenomenon be not present, the attempt to restore life may yet succeed. The temporal artery, by reason of its nearness to the surface, may be selected for the operation, as also for the slight degree in which it retracts. When the artery has been exposed, its colour should be observed. After death it becomes of a yellowish or orange colour; during life it has the colour of the surrounding tissues. Its pulsations, if any exist, may then be observed; but it may be noted that the sudden exposure to the air sometimes stops the pulsation; from this, however, it will soon recover, if life be not extinct. In the dead body the artery will gape when divided, and little or no blood will flow, other than a few coagula. If the blood should flow by jets, a compress will restrain it.

Atmospheric Micrography.—An interesting article, by the Rev. M. J. Berkeley, on this subject, appears in the *Quarterly Journal of Microscopical Science*, a *propos* of Dr. Cunningham and Dr. Lewis's investigations in India, undertaken with

a view of discovering the origin of cholera. The apparatus employed by Dr. Cunningham was a box with a hole in one side, turning freely, so as to present the orifice constantly to the wind, the particles impinging on a vertical slip of microscopic glass painted with glycerine, and capable of being transferred without danger of their being rubbed off to the table of the microscope, care being taken that everything was made previously as clean as possible. The diaphragm was removed every twenty-four hours, and magnifying powers varying from 400 to 1,000 diameters were used. On examination the deposits were found to consist:—

1. Of particles of siliceous matter.
2. Particles of carbonaceous matter.
3. Fragments of hair and other animal substances.
4. Fragments of cellular tissue of plants.
5. Pollen-grains, amongst which those of several common Grasses could be easily recognised.
6. Algae, few in number, but consisting of fragments of Oscillatoria, Desmidiaceae, Closterium.
7. Sporidia of Lichens (frequent).
8. Spores or sporidia of Fungi, such as Macrosporium, Cladosporium, Helminthosporium, Sporidesmium. The Yeast fungus. The curious genus Tetraploa, Triposporium. Spores also of Uredineae, and more rarely of Puccinia and the sporidia of Sphaeriaceae, and the spores of Myxogastres. The quantity of fungus spores carried about by the air is thus seen to be very remarkable.

Dr. Cunningham made also some interesting observations on the organisms which appeared in rain water in India. His conclusions are as follows:—

1. Specimens of rain water in Calcutta, collected with every precaution to ensure their freedom from contact contamination, sooner or later frequently show the presence of spores, mycelium zoospores, monads, bacteroid bodies, and distinct Bacteria.
2. They do not as a rule contain any of the higher forms of infusoria.
3. The zoospores are demonstrably derived from the mycelium arising from common atmospheric spores.
4. There is every probability that the monads and bacteria have a similar origin, but it remains quite uncertain whether their development is due to heterogenesis or to the presence of their germs within the parent cells, or as the result of a process of normal development in the latter.

The Structure of the Dark or Double-bordered Nerve Fibre.—A paper appears with this heading in the last part of the *Monthly Microscopical Journal* (May, No. lxxv.), from the pen of Dr. H. D. Schmidt, of New Orleans, in which he states that, knowing from experience success in resolving the fine lines of Diatomaceae depended to a certain degree upon the correct illumination of the object with oblique light—provided the angle of aperture of the objective is sufficiently large to admit such a portion of the oblique rays as is required for the purpose—he has employed it more or less for a number of years in his histological studies, and has gained many advantages by it. For the preservation of nervous tissue, he finds solution of chromic acid most serviceable, whilst it may be stained with chloride of gold. He prefers, however, to examine it in the perfectly fresh condition, with the addition only of a little aqueous humour. He then goes on to say that the dark-bordered fibres present, when examined in the still living animal, sharply defined double contours. The space between these contours, representing the greater portion of the entire nerve fibre, appears to a certain degree opaque, except where it borders on them; there it is seen as a clear stripe, becoming gradually fainter in the direction of the axis of the fibre. On the addition of a drop of water, a fine dark line is seen to appear in the interspace of the double contour itself, dividing this, so to say, into two halves. The outer half is distinguished by a reddish, and the inner by a greenish line, the difference in colour pointing to a difference in the chemical composition. After a time the inner dark line, forming a part of the original double contour, is gradually dissolved

and lost sight of; with it, of course, the inner greenish shining half of the original double contour also disappears, whilst the outer half with the loss of its reddish hue remains. In consequence of these changes, the fine dark median line which at first appeared, after the addition of water, dividing the original double contour, now forms the inner contour of the nerve fibre. At the same time an important change takes place in the main part of the nerve fibre, situated between two now very fine double contours. This consists in the appearance of certain irregular figures often described, which, examined with sufficient amplification and central illumination, resemble somewhat an irregular network of fine tubular elements, as Stilling once described them, but by a closer examination with an oblique illumination are found to represent in reality a great number of fine fibrils, which in their usually wavy or tortuous course frequently cross each other, either singly or in the form of fasciculi, and thus give rise to the resemblance to a network. So, again, if fresh nerves are torn, a portion of the soft semi-fluid medullary substance, or nerve medulla, is almost always seen to escape from their open ends. With low powers this appears as a homogeneous semi-fluid substance; but, as Stilling first pointed out, and as Dr. Schmidt maintains, it is mostly composed of exceedingly fine and smooth fibrils surrounded by a semi-fluid finely granular substance. His examination of the anatomical composition of the nerve medulla has led him to the conclusion that it consists of two layers distinctly differing from each other. The outer one of these shows a structure composed of very delicate and smooth fibrils, about 1,200 mm. in diameter, and arranged parallel and very close to one another. The inner one surrounds directly the axis cylinder, and consists of a finely granular amorphous and semi-liquid substance. The former he terms the fibrillous, the latter the medullary layer. In regard to the axis cylinder, Dr. Schmidt describes it as consisting of minute granules about 1-1200 mm. in diameter, which are arranged in regular rows, and united by a homogeneous interfibrillous substance, and thus form a bundle of granular fibrils. Each axis-cylinder is therefore according to its thickness composed of a number of thin granular fibrils, which, united into a fasciculus, are enclosed within a distinct delicate membranous sheath.

Functions of the Nerves and Muscles of the Larynx.—A long and interesting paper on this subject appears in the last volume (ix. p. 258) of the *Zeitschrift für Biologie*, from the pen of Dr. Schech. The experiments he performed were made on young dogs previously narcotised with morphia, and the effects of the division of nerves and of the paralysis of muscles were observed by means of the laryngoscope. He arrives at the conclusion that Bischoff did before him, that the motor nervous fibres of the larynx are derived from the spinal accessory nerve; since, when this nerve is torn out by the roots on one side, the vocal cords of that side are rendered perfectly immovable, whilst, after ablation of both, no movements of the cords occur whatever, and there is complete aphonia. Section of the superior laryngeal nerve previous to its division or section of its external laryngeal branch paralyzes the crico-thyroid, and causes the voice to be hoarse. No high notes can be produced. In regard to the action of the crico-thyroid muscle, he thinks that, when the thyroid cartilage is fixed by the thyro-hyoids, the crico-thyroids draw the fore part of the cricoid upwards, causing the body of the cricoid to rotate downwards and backwards. But as the thyroid is fixed anteriorly by the thyro-hyoid muscles, whilst the arytenoids are fixed posteriorly to the cricoid with which they move, any backward inclination of the cricoid, such as that produced by the crico-thyroid, must cause the arytenoids to be inclined backwards also, and thus put the vocal cords on the stretch and aid in the production of high notes. The recur-

rent nerves supply all the muscles of the larynx with the exception of the crico-thyroid. If they be divided on both sides, the effects observed are complete aphonia and immobility of the vocal cords, which take up the position they assume after death. The crico-arytenoides posticus he finds to be, as is generally admitted, the dilator of the glottis.

ACCORDING to the recently published *Report of the Works of the St. Gotthard Tunnel*, the progress made from the beginning of the excavations, April 1, 1873, to April 1, 1874, was about 4 mètres daily, as the combined result of the labour at the north and south extremities of the shaft.

WE learn from the Italian papers that the attempts made last year in Italy, without success, to grow the tea-plant, are being renewed in the southern districts of Sicily. It is hoped that this attempt will prove successful, as special pains have been taken to procure seeds and plants from the best sources direct from Japan. Last year's failure is not unreasonably referred to the fact that the entire stock of seeds and plants had been injured by immersion in sea-water through the shipwreck of the cargo.

THE twenty-fifth volume of the *Fortschritte der Physik*, which has just been completed by the Berlin Physical Society, contains an account of all writings in Natural Philosophy for the year 1869, and consists of 1,083 pages, being considerably larger than any previous volume.

THE Anderson School of Experimental Zoology on the Island of Penikese, of which Professor Alexander Agassiz is the director, will be opened on July 7. A steamer will leave New Bedford for the island every day during the first week, but afterwards it will only make three passages a week.

THE Agassiz Memorial Committee (which includes Professor T. Lyman, Professor B. Pierce, Professor Joseph Henry, and Professor J. D. Dana, among its members) has issued a circular appealing to the friends of liberal culture both in America and the Old World, for assistance in the attempt to endow adequately the Museum of Comparative Zoology at Cambridge, Mass., which was founded fifteen years ago by Agassiz, and has grown to its present large proportions under his hand. This it is thought would be the best possible memorial to the great naturalist. Subscriptions may be sent to Sebastian B. Schlesinger, Esq., Treasurer of the Committee, 6 Oliver Street, Boston.

AN American Iron and Steel Association has just been formed in Philadelphia, with the object of emulating the valuable work done by the British Iron and Steel Institute, more especially in the devotion of particular attention to scientific metallurgy.

AT the annual meeting of the Belgian Royal Academy of Sciences, Letters, and Fine Arts on the 5th instant, Monsieur J. Liagre was elected Perpetual Secretary in place of the late Monsieur Ad. Quetelet.

THE Pacific Mail Steamship Company have just launched their magnificent iron steamer *City of Peking*, which is second in size only to the *Great Eastern*. The length of the vessel is 450 feet, the tonnage is 6,000 tons, there are ten boilers, and the estimated consumption of coal is placed at fifty or sixty tons per twenty-four hours. Five millions of pounds of iron have been used in the hull, and three of the four masts are of iron, and are used for ventilation. There is accommodation for 2,000 passengers. The attendance on the occasion of the launch at Chester, Pennsylvania, was very large.

A CORRESPONDENT at Berlin points out that the Professor Rose who has been succeeded by Dr. Webery of Breslau, as announced in the *ACADEMY* of the 9th instant, is not the great chemist of that name, but his brother, the mineralogist, who accompanied Alexander von Humboldt in his travels

through Central Asia; and that the three laboratories for Physic, Physiology, and Pharmacology (page 513) will be built, not at Potsdam, but at Berlin, on a large piece of ground at the corner of Wilhelms- and Dorotheenstrasse.

DR. BURMEISTER, well known for his thorough knowledge of the natural history of the region of La Plata, where he has resided for many years, has been nominated to the post of Director of the Natural History and Physical Faculty of the University of Cordova, where seven chairs are already held by German professors.

PROFESSOR SCHIAPARELLI has offered the astronomer Vito Eugenio, of Parma, the directorship of the Astronomical Institute of Tung Wan, Peking, with a salary of 16,000 francs for the first five years, to be raised to 20,000 francs till the tenth year, after which it would be still further augmented. In case Signore Eugenio should accept the post, a house rent-free and two servants would also be provided for him, and an Italian doctor would be maintained, at the expense of the Government, for the benefit of the director and his staff of assistants.

THE Italian papers announce that the Joint Commission of Royal Italian and Austrian Engineer Officers, appointed some years ago to fix the measurement of a degree for Europe, have this month recommenced their labours, and are now engaged in determining a geodetic base near Udine. The Italian staff is under the direction of Major-General de Vecchi, chief of the Topographical Survey, while the Austrian engineers are under the orders of Colonel Ganhal, Director of the geodetic operations of the Geographical Institute at Vienna.

DICTIONARY making seems to be the order of the day among Oriental scholars, and no kind of work could be more useful. A dictionary generally marks and closes a period in the history of scholarship. It embodies in the shortest and most accessible form the results obtained by one or two generations of scholars, and it generally happens that, before it is finished, a new start has been made, and new materials have been accumulated, which must wait for the next collector. Lane's *Arabic Dictionary*, Boehlingk and Roth's *Sanskrit Dictionary*, Smith's *Syriac Dictionary*, Childers' *Pali Dictionary*, all are cases in point. No task is in itself more ungrateful than that of the dictionary maker. The materials which he has brought together are used by everybody; but no notice is taken of the compiler, except when those who consult his work discover a mistake, that must be corrected. It is but right, therefore, that every support should be given to those who undertake the arduous task of compiling a dictionary, not from other dictionaries, but from original sources; and we wish to call attention to a most important enterprise, the compilation of a really adequate Hindustani dictionary, by Dr. Fallon, the prospectus of which has just been sent to us from India. Dr. Fallon shows that Shakespeare's and Forbes's dictionaries and Wilson's *Glossary*, all fail to give an idea of the language as really spoken by the people of Hindustan. They are chiefly, if not entirely, founded on literary works. They contain many Arabic, Persian, and Sanskrit words which are never used in conversation, and they are deficient in those familiar expressions which constitute the life and charm of every-day conversation.

"The maulvis and pandits," says Dr. Fallon, "who have hitherto been the chief assistants in compiling Hindustani Dictionaries, have banished the people's mother-tongue, and forged in its place the artificial language which divides the people and the ruling class. With might and main they have laboured to keep out the spoken vernacular from the written language of books and legal procedure and official correspondence; and what they were unable wholly to thrust out of sight, they have mutilated, mangled, and crushed."

Dr. Fallon goes so far as to say that the introduction of this highly artificial and unreal language, which is learnt as Hindustani by all civilians, has rendered any familiar intercourse between the rulers and the large masses of the ruled almost impossible. Mr. Beames, a distinguished member of the Civil Service, and one of the best Hindustani scholars now in India, speaks even more strongly on this subject:—

"I venture to give a decided opinion," he says, "because I think few civilians have taken so much pains to master the spoken Hindustani as I have. After I had acquired Persian and Arabic, and had advanced into the higher regions of those studies in the Panjab, under the tuition of experienced maulvis of Delhi and Ambala, I set myself to master, first, the high-flown literary 'Urdu,' and secondly the ordinary colloquial Hindustani. In the latter endeavour I spent ten years, and I mention these personal facts because they bear directly upon Dr. Fallon's project. I had to learn Hindustani entirely from the lips of my teachers. There existed no books from which I could acquire the real every-day familiar talk of the masses—and, as far as I am aware, there exist none yet. The consequence is, that our officials learn a stilted artificial form of speech, which only enables them to speak to their own *Omla* or the court *Mooktears*, and they are thus at the mercy of a very corrupt and designing class of people. When an English officer goes into a village, and begins to talk to the people, even if he speaks the purest high Urdu, they generally understand him so little as to suppose he is talking English! I say this from experience, not of districts where a *patois* widely diverging from the standard type is spoken, such as the Bhojpuri of Behar, but of districts where the village speech is closely similar to the literary type."

These are strong and startling statements, and deserving of careful consideration on the part of Indian statesmen. No one doubts the competence of Mr. Beames to speak with authority on such a subject. Dr. Pischel, in his essay, *De Grammaticis Pracriticis*, speaks of him as οἷος πένυρα· τοὶ δὲ σκαὶ ἀποσσοῦν, a remark which has so roused the anger of a well-known writer in the *Literarische Centralblatt* that he thinks it proper to call Mr. Beames *Mr. Tiresias Beames*, while complaining in the same breath that to be called *cæcus* is a breach of the most ordinary civility, due from one scholar to the other. Even if Mr. Beames' remarks should prove somewhat exaggerated, they would still go far to prove how useful a work Dr. Fallon is undertaking, and how well bestowed the patronage of the government would be, if it enabled him to bring out such a work as he has projected. If the necessary assistance were given him, it would become a complete survey of the living dialects of India, and would yield results not only of great practical usefulness to civilians, but also of considerable interest to the student of language. Each class of society has its own peculiar idioms; the agricultural class, the *banya* (grocer), *bazzáz* (cloth-merchant), *dallal* (broker, or tout), *chamár* (worker in leather), *kunjra* (greengrocer), *banjára* (carrier), *bhatyára* (inn-keeper), *nái* (barber), *chábúksavár* (jockey), *patang-báz* (kite-flyer), *juári* (gambler), *kanjar* (gipsy tribe), *bhát*, *dome*, *gavvát*, *bhánd*, *naqqál*, *nát*, *bhánmati* (bards, musicians, minstrels, players, acrobats, jugglers), all have words of their own, which are wanted for official transactions, and which often constitute the very pith and marrow of the popular speech.

Besides the local dialects of Hindustani, which, as the proverb says, change every 12 *kos*, the new dictionary is to contain what Dr. Fallon calls the vocabulary of women, the *rekhti* or *zamáni boli*. Some portion of this vocabulary is more or less current in the language of men; but the greater part is still confined exclusively to women. The divergence is greatest where the men are educated Mohammedan residents of towns, while the women with whom they may be brought into relation are illiterate country-bred Hindus; and it is least where the men and women are illiterate Hindus of the rural class. He who

would find the best idioms of the native stock, with the truly naturalised portion of the foreign element, must look for them, as Dr. Fallon tells us, in the conservatism of the female instinct. In the speech of the women of India, moreover, is mirrored the very image of the thoughts and feelings by which humanity is moved. The songs composed by women are distinguished by a natural charm and simple pathos which make their way to the heart of the people. Theirs is the natural language of the emotions. The only aliens in the language are creations of the pen. The truly national speech is that which bears the people's stamp, and in this category the first place must be assigned to the language of women.

These observations of Dr. Fallon's on the language of women are extremely curious, and they remind one of the words of Cicero (*De Orat.* iii. 12):—"Equidem cum audio socrum meam Laeliam (facilium enim mulieres incorruptam antiquitatem conservant, quod multorum sermonis expertes ea tenent semper quae prima didicerunt), sed eam sic audio, ut Plautum mihi aut Naevium videam audire."

It is the intention of the compiler of this new dictionary to bring together all equivalent forms in the more important older or Prakrit dialects, as the Brij of Mathura, the Magadhi (Maggal) of Behar, the Bhojpuri of Shahabad, the Tirhúti of Mithila (Tirhut), with the Márwári of Bikanir and Jodhpore, and likewise to give the etymology of each word, as far as that is possible. The dialectic variety of the living speech of India is most surprising and most instructive. Thus, by the side of *tera*, thine, we find the rustic forms *tor*, *tora*, *tohar*, *tohra*, *tohára*, *tohár*, *tehdár*, *tuhra*, *tehára*, *teháro*, *thára*, *tain-ka*, *tumra*, *tumhára* (the two last used both in the sing. and plur.). Instead of the ordinary termination of the genitive, *ka*, *ke*, *kí*, we find *kai*, *kar*, *ker*, *kera*, *kert*; also *sa* and *an*, instead of *iska*, his, *ruskar*, *ekar*, *kai*, *ekai*. For noting all these minute shades of dialectic variation a practised ear is wanted, and we could wish the compilers a few lessons in phonetics from Mr. Bell or Mr. Ellis.

The more important meanings of each word will be illustrated by quotations, and here a new element will be brought in, viz., the proverbs with which the language of the people abounds. The rural districts are full of these pithy bits of wisdom, and they form an essential element in Eastern conversation. Roebuck collected 2,500 Indian proverbs; Dr. Fallon has collected 4,000 more. Dr. Fallon has been thirty-eight years in India, and the best authorities, Mr. Beames and others, agree that no better man could be found for carrying out this truly national undertaking. Dr. Fallon is ready to stay in India to finish and print his Dictionary, but he cannot do it unless the large outlay is covered by a grant from Government or private subscriptions. The expenditure occasioned by the famine is now the official excuse for declining all so-called unnecessary outlay, and we fear that the opportunity now afforded for carrying out a truly national work—a survey of the living speech of India—will be lost, unless the authorities at home show that they have not forgotten the old rule of true statesmanship, *Aequum memento rebus in arduis servare mentem*.

DR. H. GRAETZ, of Breslau, has completed his great work on the History of the Jews, *Geschichte der Juden* (Leipzig: Leiner), by the publication, not of the last, but of what should be the first volume. The arrangement, however inconvenient to the reader, may be justified by the greater obscurity of the period before Solomon, which seemed to require a more mature consideration. The result, however, is not wholly satisfactory. So far as the outward setting of the facts is concerned, Dr. Graetz is, perhaps, superior to his predecessors, since he has had the singular advantage of studying the scenery and geography of Palestine on the spot. We wish we could add that he had gained in width of view or amenity of manners, but in spite of many striking criticisms

on special points, there is a total absence of historical sense, combined with a degree of contemptuous dogmatism, which can only be matched by Professor Ewald. Nor will orthodox readers be gratified by any counterbalancing tenderness for traditional theories. Graetz, and Graetz alone, is the hierophant of the mysteries of criticism. In spite of these defects, the work is too valuable to be ignored, at any rate by students of Hebrew, who will find many plausible emendations of corrupt or obscure passages.

A work of much greater critical value, and likely to exercise a growing influence on the educated public, is Dr. Kuenen's *Religion of Israel to the Fall of the Jewish State*, of which the first volume has just appeared, thoroughly well rendered into English, in Messrs. Williams and Norgate's Theological Translation Library. Dr. Kuenen is now one of the first Old Testament scholars on the Continent, and writes in a style acceptable to the general reader, as well as to the theologian. We take some credit to ourselves for having been among the first out of Holland to recognise his merits (see *ACADEMY*, vol. iii. p. 8). In his strict subordination of theories to facts, and absolute freedom from critical prepossessions he contrasts favourably with Ewald.

Having written the above, in justice to an able scholar, not yet known in proportion to his merits, we are bound to acknowledge that Ewald's *History* made an epoch in Biblical criticism, and that nothing can exonerate the student from the duty of reading it. The same learning and enthusiasm which characterise the earlier volumes are conspicuous in the fresh instalment of the English translation (vol. v., by Messrs. Longmans), which has the additional merit of not having been superseded to any considerable extent by more recent researches. It is no easy task to render Ewald's cumbrous German, but Mr. Carpenter has acquitted himself of the task in a generally admirable manner. No one should henceforth read the original who can obtain access to the translation. The new volume contains "The History of Ezra and of the Hagiocracy of Israel to the time of Christ."

At a meeting of the Cambridge Philological Society last month, Mr. Fennell put forward several Greek and Latin etymologies connecting *αἰκάλλω* with *κόλαξ*, *δοχος* with the Sanskrit *śakha*, *δελάζω* with *conor*, and referring *μάρπτω* and *ἐν-σπῆ* to the roots *mrig* and *sak*. Mr. Magnússon followed by comparing the termination in *sk* of certain English monosyllables with the Icelandic *sk* and the German *sch*, referring *blush*, for instance, to the Icelandic reflexive *blyggjask*, *gush* to *geysask*, and *smash* to *smásk* ("to make small"). He also pointed out that *lyf* occurs in the older Edda in the sense of "a whit," so that here we have the true etymology of the English *love* in such phrases as "love all" or "love ten," where the word cannot be connected with the ordinary synonym of affection.

M. D'HERVEY DE SAINT-DENYS has been chosen by the Academy of Inscriptions as its candidate for the chair of Chinese at the Collège de France, vacant by the death of M. Stanislas Julien.

A SUM of 100,000 francs has been presented by a private benefactor to the University of Basle to found a chair of Comparative Philology.

TRÜBNER'S *Record* announces the death of the Rev. Francis Mason, D.D., of British Burmah, in his seventy-fifth year, after returning from a journey to Bharno, in Upper Burmah. He had been only recently appointed Professor of Páli in the Government High School at Rangoon. From *The Story of a Working Man's Life*, the autobiography of Dr. Francis Mason, we learn that he was born in 1799, at Walmgate, in the city of York. His grandfather was the founder of the Baptist Society in York, not Calvinistic but Unitarian Baptists, and Dr. Mason was brought up among that body. In 1818 he joined his uncle,

who was settled in the United States, from whence he went as a missionary to India. Besides translating the Bible into Karen, Dr. Mason was the author of a *Pili Grammar, Annotations on the Pili Text of Kachchayano's Grammar, a Karen Grammar of both Dialects, The Story of a Working Man's Life, and Tenasserim* in 1852, afterwards published as *Burmah* in 1860. In 1871 Dr. Mason issued a prospectus of a third edition of this work, to be called "The Hand-book for Burmah," but we believe this was not completed at the time of his death.

At the Anniversary Meeting of the Philological Society, the following members were elected as the Society's Council for 1874-5—President: the Rev. Richard Morris. Vice-Presidents: the Lord Archbishop of Canterbury; the Archbishop of Dublin; the Lord Bishop of St. David's; Edwin Guest, Esq., Master of Caius College, Cambridge; T. Hewitt Key, Esq.; Whitley Stokes, Esq.; Alexander J. Ellis, Esq. Ordinary Members: E. L. Brandreth, Esq.; C. Cassal, Esq.; C. B. Cayley, Esq.; Sir Edward Colebrooke, Bart.; the Rev. B. Davies; Sir J. F. Davis, Bart.; Danby P. Fry, Esq.; H. H. Gibbs, Esq.; E. R. Horton, Esq.; the Rev. B. H. Kennedy; J. Peile, Esq.; J. Muir, Esq.; James A. H. Murray, Esq.; Henry Nicol, Esq.; Joseph Payne, Esq.; Charles Rieu, Esq.; the Rev. W. W. Skeat; Henry Sweet, Esq.; Edward B. Tylor, Esq.; Hensleigh Wedgwood, Esq. Treasurer: William Payne, Esq. Hon. Secretary: Frederick J. Furnivall, Esq.

DR. B. C. SMART, of Manchester—who in 1863 published in the Philological Society's Transactions a short treatise on "The Dialect of the English Gypsies," containing an Introduction, Grammar, and Glossary—has since been adding to his material, and much enlarging his grammar. A gipsy-loving friend has helped him in his work, and the result of their labours will be published by Messrs. Asher & Co., of Bedford Street, Covent Garden, as soon as a few subscribers' names are secured.

THE *Revue de Linguistique* for April, 1874, contains: "Observations critiques sur le XVIII^e fargard du Vendidad," by A. Hovelacque; "Recherches sur la nature et la mode de formation du verbe basque," a reply by H. de Charencey to an article by M. Vinson in the preceding number of the review; "Les Dieux du Vent. Vāyu et Vāta dans le Rig-Vēda et dans L'Avesta," by Girard de Rialle. But the most important feature of the present number is a series of tables, "Tableau phonétique des principales langues usuelles," by E. Picot. There are seven tables. The languages compared are the Germanic, Romance, Romaic, Slavonic, and Ural-Altaic groups; Greek and Arabic have each a separate column. An attempt is made in these tables to classify by literal equivalents nearly all the sounds, as well as single letters, of the languages of which they treat.

MEETINGS OF SOCIETIES.

PHYSICAL SOCIETY (Saturday, May 9).

DR. RAE read a series of notes on observations made by him in the Arctic regions. The first had reference to the question of the freshness or saltiness of the water obtained by melting the ice formed by the freezing of sea-water. Dr. Rae and his companions found the water so obtained to be almost always salt, although in exceptional cases it was fresh. He explained these exceptions by supposing that, in the freezing of sea-water, crystals of pure ice are formed which imprison in their interstices a brine containing nearly all the salt of the original sea-water, but that, in some cases, as when for instance a mass of ice gets raised above the general level, this brine may drain out from among the ice-crystals, and hence the latter when melted give pure water. Dr. Rae's second note contained an explanation of the way in which boulders are raised from the sea bottom to the surface of ice-floes. His mode of accounting for this fact

is as follows:—The water above and surrounding a boulder freezes, so that the boulder becomes imbedded in a large mass of ice. This ice, and the boulder with it, is afterwards raised from the bottom by the tide flowing underneath it; fresh ice then forms below, while ice is gradually removed from the upper surface by melting and evaporation. Hence, what was at one time the bottom of the mass of ice gradually comes to the top.—Dr. Rae also communicated some further observations relating to matters not of a strictly physical nature. A discussion followed the reading of these notes, in which Professor Tyndall and Professor Guthrie took part. Professor Guthrie gave the results of some experiments which he had made, in order to put to the test Dr. Rae's view of what occurs during the freezing of sea-water. He placed a freezing mixture of ice and salt in a flat-bottomed tin vessel, which he supported so as to be in contact with the surface of a quantity of sea-water contained in a wide beaker glass. In this way the upper part of the sea-water was frozen under conditions in general analogous to those existing in nature—that is to say, by the withdrawal of heat from above. In order to compare the degree of saltiness of the water obtained by melting the resulting ice with that of the original sea-water, Dr. Guthrie evaporated weighed portions of each, and found that the saline residue left by the sea-water when evaporated at 100° C. amounted to about 6½ per cent., and that the residue from the frozen sea-water was about 5½ per cent.: whereas, the residue obtained from some of the same ice which had been broken up and pressed between blotting-paper, so as to remove any still liquid brine which might adhere to the crystals, was only 0.47 per cent.—The other papers read were by Dr. W. H. Stone on "The Lowering of the Pitch of a stretched Wire by the Passage of an Electric Current through it," and by Mr. A. S. Davis, on "A Mode of illustrating experimentally the Laws of the Transmission and Composition of Vibrations, especially in the case of Strings."

PHILOLOGICAL SOCIETY (Friday, May 15).

MR. A. J. ELLIS, the President of the Philological Society, delivered the annual address on the progress of Philology during the past year. The address embodied reports by Professor Aufrecht on Etruscan, by Mr. A. H. Sayce on Semitic and Assyrian, by Professor Gaidoz on Celtic, by Dr. Wagner on Modern Greek, by Professor Robinson Ellis on Latin, by M. Paul Meyer on Romance, and by Mr. Henry Sweet on Germanic and Scandinavian, and the President himself reviewed the recent labours of the Society, gave an account of English Dialectology and of Pott's *Wurzel-Wörterbuch*, and entered with some detail into the question of Greek and Latin Pronunciation, theoretical and practical. The last twelve months have witnessed great and ever-increasing activity in the philological world; new facts have been collected, new theories suggested, and old hypotheses criticised. Professor Aufrecht, while pointing out the philological shortcomings of Mr. Isaac Taylor's recent work on Etruscan, showed at the same time how impossible it is to consider this mysterious language as belonging to the Arvan group. Mr. Sayce glanced over the whole field of Semitic philology, dwelling more particularly upon the light thrown upon it by newly-found inscriptions, especially those of Assyria, and drawing attention to the Accadian, the primitive agglutinative language of Babylonia, which not only is likely to be the Sanskrit of the Turanian tongues, but is found to have exercised a great influence upon early northern Semitic speech and civilisation. Celtic is at last being studied in a scientific spirit, and the *Revue Celtique*, under the editorship of M. Gaidoz, is enabling Celtic scholars to meet together and compare notes. Some of the most important Modern Greek words noticed by Dr. Wagner have already been reviewed in the

ACADEMY, and the bearing of the modern dialects upon the classical languages is now becoming recognised. Dr. Wagner instanced the modern Greek use of *rov* for *avrov* and *ov*, as in Homer, and suggested to the English schoolmasters the advisability of reforming our present indefensible pronunciation of ancient Greek. The President further insisted upon this point, urging that we should assimilate our pronunciation as far as is possible to that of the modern Greeks themselves, and reviewing the difficulties attendant upon a reconstruction of the actual pronunciation of the ancients. Professor Ellis, followed by the President, also started the question of Latin pronunciation; and both recommended the adoption of the system proposed by the Oxford and Cambridge Professors. It is time that we should cease to murder Latin as English would be murdered if read with a French accent. M. Paul Meyer's report was long and interesting, and was read in its original French. After a review of general Romance philology since the era-making book of Diez, a comprehensive account was given of all that has been done and is still doing in this field among each of the Neo-Latin nations. As is natural, Italy and France are taking the lead. Mr. Sweet's report showed that Teutonic philology is in no way behind Romanic; and the recent formation of an English Dialect Society proves that we also are alive to the importance of collecting and preserving those "provincialisms" which are so peculiarly valuable in the eyes of the comparative philologist. The completion of Professor Pott's great work on Roots afforded the President an occasion for impressing on his hearers the fact—too often forgotten in linguistic enquiries—that roots are not natural entities, but investigators' hypotheses. They are the final results arrived at by our philological analysis; but there never was, and never could be, a language of roots.

ROYAL ASIATIC SOCIETY (Monday, May 18).

ANNIVERSARY MEETING.

MAJOR-GENERAL SIR HENRY C. RAWLINSON, K.C.B., Director, in the Chair. A report of the Council on the progress of Oriental research during the last two years was read by the secretary. It commenced by giving a brief account of the work done by the institutions connected with the society, viz., the parent society at Calcutta and the branch societies at Bombay, Colombo, and Shanghai, enumerating the chief papers contained in the Journals of these institutions. The operations of the archaeological surveys in Northern and Western India, and in Java, were then reviewed, and attention was drawn to the great importance of the speedy survey of the ancient ruins, and the copying of the numerous inscriptions in Ceylon, by which it was expected that much light might be thrown on some dark portions of Indian history. After stating the results of the official examination and cataloguing of Sanskrit MSS. in India by Dr. G. Bühler and Bābū Rāgendralāla Mitra, an account was given of the principal publications during the last two years in the various departments of Oriental historical, philological, literary, and numismatic research.

Mr. Lewin Bowring, C.S.I., late Chief Commissioner of Mysore, in proposing a vote of thanks, called the attention of the meeting to the very great importance of the examination and publication of the Southern Indian inscriptions, in which he had been much interested during his stay in India. The meeting was addressed successively by Sir Henry Rawlinson, Sir Bartle Frere (President), and Sir Edward Colebrooke, Bart. (Vice-President); and finally the election of the council and officers for the ensuing year took place.

NUMISMATIC SOCIETY (Thursday, May 21).

A PAPER by Mr. Cochran Patrick was read on "The Scottish Coinage of James VI. after his

Accession to the English Throne." Mr. Patrick produced the evidence of a Privy Council minute to show that, between the years 1606 and 1609, the coinage of the Northern mint differed from that of London only in the mint-mark and workmanship; it was not till 1609 that the difference was made of putting the Scottish arms in two quarters of the shield.

Mr. Henry W. Henfrey contributed a paper on "The Reverse Die of a Half-crown of Charles I. struck at the Shrewsbury Mint;" and also an interesting account of Snelling's seventy-two copperplates, which Snelling himself supposed to have been engraved about the year 1650, and which Mr. Henfrey proves by a contemporary document to have been engraved in 1652, but not then used, by reason of the dissolution of the Long Parliament by Cromwell in April of 1653.

CHEMICAL SOCIETY (Thursday, May 21).

DR. CORFIELD gave a lecture on the Sewage Question from a Chemical point of View.

After an account of the chemical composition of the refuse matters which require to be removed from habitations, and of their theoretical value as manures, Dr. Corfield said that chemists were called upon to advise as to the deodorisation of such matters with a view to their preservation for a longer or shorter period in habitations; as to their treatment after removal, whether by collection from house to house, or by water carriage, and in the latter case, as to the results of such treatment in the production of an effluent water sufficiently pure to be discharged into a stream. He deprecated all methods of conservation of refuse matters in and about houses, deodorised or not, and said that chemists should attend most especially to the treatment of sewage, i.e. of the foul water that is carried away from towns by the sewers.

He passed in review many of the proposed plans for precipitating the valuable matters contained in sewage, and came to the conclusion that they may, several of them, be used as a preliminary to filtration or to irrigation, as they render the sewage much less offensive, although they all leave the greater part of the manure in the water. It had been conclusively shown that filtration through soil, if downward and intermittent, was a means of purifying foul water, and irrigation farms ought to be constructed as large filters. He quoted examples of farms in which the sewage did not pass *through* the soil but only *over* it, to show that the purification was only effected in them during the period of rapid plant growth, and it was chemistry that had conclusively shown that irrigation farms ought to be provided with drains, and that the sewage must go through the soil; when this was the case the effluent water was very pure.

NEW SHAKSPEARE SOCIETY (Friday, May 22).

THE paper read last night was by Mr. Hales; the subject "The Porter in *Macbeth*." Mr. Hales began by referring to the doubts thrown of late on the authenticity of certain passages in *Macbeth*; and, after quoting Coleridge's remarks on the Porter's soliloquy and the short dialogue that follows it, proceeded to discuss those doubts so far as they concern this particular passage. He said that unquestionably, whoever composed it, there must have been a Porter's speech in the original play. This point was urged by the consideration that so much is made of the "knocking scene," and that with that scene the Porter is inseparably associated. It could not be conceived that the Porter would appear to answer the knocking and never utter a word. It was then shown that just before the Porter's appearance the intensity of the drama had reached a degree at which some relief was necessary. The terror was on the verge of becoming oppressive—painful and not pleasurable, and some respite was needed. This was illustrated from the life of Mrs. Siddons, who, studying the assas-

sination scene all by itself, without the intermission the play provides, was almost overcome with the horror of it. Further, it was suggested that the introduction of the Porter was in accordance with the law of contrast elsewhere followed by Shakspeare; and of this law some interpretation was suggested, and some illustrations quoted from other plays. In the next place, the dramatic pertinence of the soliloquy was pointed out—how there runs through it a certain irony, and the Porter was nearer the truth than he imagined, when he entertained the fancy of Macbeth's castle being the infernal regions, for indeed how dreadful was that place; was it other than the home of the devil, and the gate of hell? Lastly, the language was examined, and found to be in parts distinctly Shaksperian, and in no place un-Shaksperian. The objections preferred against the passage were then briefly considered. The conclusion arrived at was that there were several powerful reasons for believing it to be Shakspeare's work, and that nothing has yet been advanced on the other side sufficient to counterweigh them.

FINE ART.

EXHIBITION AT THE PALAIS BOURBON.

THE exhibition of pictures now open to the public in the rooms of the old building of the Corps Législatif, re-christened the Palais Bourbon, is one from which it might be possible, did one but give sufficient time to it, to acquire the elements of knowledge of all serious Art. For scarcely anything worth calling serious Art is wholly unrepresented there, though, of course, Art's different phases are represented with very varying completeness and incompleteness. There is no attempt at system or proportion. In the main the exhibition consists of the works of ancient masters and of deceased French artists. Hearing this, one compares it in imagination with the winter gatherings we have generally been fortunate enough to have at Burlington House—the deceased French artists holding, of course, the same place in Paris that our Reynolds, Gainsborough, and Romney hold in London—but on inspection the comparison is found not to hold good, for while generally at Burlington House the works of the deceased Englishmen have been a pleasant addition to the assemblage, at the Palais Bourbon the works of the great Frenchmen of the last generation are really the mainstay of the show. These, at all events, are contributed in the greatest profusion, so that here the battle of classicists and romanticists is again fought out, and David once more is in conflict with Greuze, and Ingres with Delacroix, while Memling and Cranach, Ruysdael and Hobbema, Morland and Constable stand by to see. And yet these and their peers must not be treated as mere *tenoires*, though their presence here is not as important as it has been elsewhere—though they do not make the speciality of the present show to those who, like most of our readers, will see the present show with memories still vivid of the Louvre and of Burlington House.

One's difficulty in an article brief as the present one is how to do the least injustice where so much injustice must perforce be done. One must touch here and there at a venture: contenting oneself with the modest and uncritical aim of persuading those who read that here, indeed are treasures such as Burlington House has this year ridiculously denied them.

Among the many *chefs-d'œuvre* in the possession of Madame la Comtesse Duchâtel, is a considerable work of Memling's: the Virgin and the Holy Child adored by a numerous family who crowd round the objects of their devotion. The Virgin and the Child have no special distinction; but each one of the worshippers repays a careful study, for each is the work of a painter who, however much he was fettered by his own free will, if that may fairly be said, as to the choice

of his subjects, did always seek and always find individuality in the things around him, and did always express the same with firmness and vigour, with variety, without satiety, with directness, with frankness. Here, as nearly everywhere else in his work, his bystanders are portraits, and portraits of those whose characters he has wholly fathomed, and who play their part in his work, like the great portrait-subjects of a later time, without thought of the art, or of the artist, or of the spectator who will pass before them. Here the grouping has a stiffness from which in his narrative pictures—in his more dramatic work, such as the marvellous *Salome with the Head of St. John Baptist* at Bruges, Memling completely emancipated himself; but for the painstaking portrayal of many an individual of his time, with nothing obtruded and nothing scamped, it may well deserve attention; and if I add that, in its absence of dramatic subject, it lacks the dramatic inspiration which belongs to the Bruges *Salome*—who, though not virginal, is yet young, and is sickened at sight of that bleeding head—I do but confirm my earlier remark to the effect that, in the main, the value of this Exhibition is not to be found in the greatness of the great masters' works. The Duc d'Aumale contributes a Luini which is of peculiar beauty, and has interest also in that it shows in its type of woman-face a further departure from the model of his master Leonardo than was Luini's wont. There is a Botticelli of *naïve* and fresh and radiant beauty, a Virgin choosing a flower out of many that are offered to the Holy Child; and, though her face bears on it a look of gentle deprecation which other theories might possibly explain, at all events it does not support that theory of Mr. Pater's that Botticelli's typical Virgin is weary of the greatness of her destiny. The Duc d'Aumale contributes his famous Raphael—the Virgin and Child of the Orleans Gallery; and he sends a Van der Velde—a marine subject, of course—which seems to me of somewhat exceptional excellence, at all events of exceptional charm; and he sends likewise, as pendant to this last, a Ruysdael which is not the familiar cascade, but the bleak beach at Scheveningen, with blustering and fitful wind and low-blown clouds and seething sea. Then comes a room devoted to last century art, in which last century art not being adequately represented by the happy genius and cultivated grace of our Reynolds and our Gainsborough, shows us something that need not detain one long, for, remembering what has gone before, and knowing what will follow after, one does not care to linger at the Court picnics of Watteau and of his pupil Lancret; still less to learn to be content with the pretty littlenesses of Fragonard, or with the rose-coloured fat nymphs of Boucher, or the ogling damsels of Greuze. Yet, if one is unfortunate enough not to have quite made up one's mind as to the position Greuze can take in last century art, it is instructive to compare the feeble sketches for his pictures with the pictures as they appear at the end; and this one can do here to some extent, and in doing it one will learn to appraise Greuze a little lower than one has done before, and this not, of course, because of their failure in points in which a great master's sketch will often be deficient, but because of their emptiness, their lack of idea—there is no germ in them, and the thing when done will still be emptiness adroitly covered, and a pale nakedness adroitly rouged. Later, one glances for a little at the manly art of Crome and Constable—art none the less strong because it is so often humble; art that was the first to find the beauty by the roadside—the beauty of chance shadow and fitful sunshine on the grey canvas awning of the waggon by the highway: the beauty of the common lines of common English country, where the grange and homestead are grouped together by the Norwich fields.

And lastly, a few words about Decamps, and Delacroix, and Ingres. This exhibition shows

them all at the worst, and also all of them at their best. Perhaps it has been most merciful to Delacroix; at all events, I have seen in it no picture of his with drawing quite so crudely bad as in one work which, in a moment of ill-advised enthusiasm, was purchased for the nation; while, on the other hand, his *Cleopatra with Anthony*, the property of Madame Carayon Talpayrac, is vividly felt and vividly executed; and though conceived without dignity, it has in it just that *actualité* which makes endurable so much of what is second-rate in modern art. Decamps has one or two landscapes with farmyard populations in the foreground, and one asks why they were done, since certainly they were not done with any country sentiment, with any sense whatever of the charm of homely things. But two of his pictures justify to some extent the position generally accorded him, since being frankly as devoid of sentiment as of all high grace of form, they make immediately to the senses a somewhat brutal but successful appeal. There is vigour enough, indeed, in these splashes of light and shade on lofty walls which we see in the Duc d'Aumale's *Souvenir de la Turquie d'Asie*, and in Mr. Wilson's *Intérieur de Cour en Italie*. There is a good etching of this last, by the by, in the lately published catalogue of the Wilson collection, and etching is well able to render such qualities as may be found in Decamps' work, since these are never qualities of line, but always of light and shade and local colour. The work of Ingres, too, is seen here at its best and weakest. *Edipe et le Sphinx*, an early work, hard, yellow, and David-like; *Le Maréchal de Berwick recevant l'ordre de la Toison d'Or*, and the *Odalisque* from the Pourtales collection—all these show how he was now awkward and now weak in his colour. Again, the *Golden Age*, with all the grace of its grouping, shows the same thing clinging to him in his latest years; and even the *Odalisque and Slave* of M. Marcotte's collection would doubtless be seized upon by his opponents as full of fault in colour, though here I think he in reality attained all that he aimed at, for there is a subdued and gentle harmony in these robes of pale saffron and pale blue, and as for the flesh, pearly, pink, and grey, it was no more meant to represent the actual hues of flesh than was the slight tint upon Gibson's *Venus*. He had his own theories of colour, whether they were true or false, and the theories were not what Georges Sand and Delacroix, chatting over his work, pronounced them to be—simple powerlessness: "l'impuissance érigée en décret." Of his greatest works, two alone are absent: *l'Apothéose d'Homère* and the *Martyre de Saint Symphorien*. Another is partially represented, for the Angelica of this gallery is but deprived of the Ruggiero who appears in the Luxembourg. She is one of the best examples of the master's power: vivid in conception, thorough in execution, dramatic in expression—yet with the beauty always above the horror—and modelled like Greek sculpture or the work of Benvenuto Cellini. The *Stratonice* is here: a master-work indeed of learning, composition, power, and high beauty. One, at least, of its figures is sublime in mute eloquence. But at last, I suppose, one comes back to the *Source*—the property of Mme. la Comtesse Duchâtel, but inadequately represented to the public by the small replica in the Luxembourg—one comes back to it, I say, with an abiding sense that it is the most perfect achievement of all modern art. Deceptive engravings and more deceptive photographs have familiarised the whole public with its subject; but its charm, like that of every *chef d'œuvre*, must remain its own, for it depends upon two things which can hardly together be ever reproduced—absolute justice of modelling and a freshness of expression so unique, that to speak of it as "une âme végétale" is only to indicate roughly the line that separates it alike from woman and saint, so that it is strangely empty, yet strangely wise; void without weariness, and lovely without thought.

Those who have time to spare will not content

themselves with the pictures alone. They will give some hours to objects it has not been possible to write about—tapestries and old furniture, arms, drawings, miniatures, faïences of Rouen, and faïences of Delft, such as we do not often see in England. There is one drawing—it is Raphael's—which has a peculiar interest. It is the drawing, in brown and white, for the Saint Cecilia, known to most of us by Marc Antonio's print. It belongs to M. Dutuit, of Rouen, who, out of his great collection of engravings, has been able to add a "first state" of the print in question. And it is interesting to see, that noble as we have been accustomed to consider the expression of Saint Cecilia's head in the work of Marc Antonio, even that greatest of all reproducers has not caught the nobility of this first sketch of Raphael's, for with all the grace, and dignity, and humility, and close attention, too, of the head in the print, it lacks that sense of young and sudden rapture in music and worship which inspired the great original artist. Yet a correction here which gives greater balance to the upper group, and lines, there, which give added grace to the raiment show us in what sense Marc Antonio was himself sometimes an originator.

FREDERICK WEDMORE.

ROYAL ACADEMY EXHIBITION.

(Third Notice.)

THE list of our incident painters is immense, my space narrow, the reader's patience, it is possible, narrower still: I apologise beforehand to many men of ability whose work, perforce, must be but slightly noticed, or even omitted altogether.

The first words may be properly given to the new name of the Exhibition, Miss E. Thompson. Pictures in general, roughly speaking, make their mark by force of colour, or excellence of design, or felicity in choice of subject. Now and then all the elements are united, and we have a veritable masterpiece; but, apart from such necessarily rare good fortune, if one element be eminently seen, and the others (what one may term) competently present, the artist can claim his triumph. As one stands and waits one's turn for the *Calling of the Roll* (142), the chorus of "Wonderful!", rising all day around this work, attests a felicity in choice of subject so decided as to explain the popular enthusiasm. The very simplicity of the scene is a proof how remarkable, in this respect, is its merit. Of course colour and design are also competent, or even the warmth of the praise justly given by a royal critic would not have met this immediate response from the multitude. But there is also something proverbially dangerous in such a brilliant success: there is a special danger in premature competency. Not to advance in lucidity and variety of colour, in absolute precision of drawing, in subtlety and charm of expression, will here be to recede. The "single-speech" orator found in himself his main obstacle to fame; and we may remember within the sphere of Miss Thompson's art one or two parallels in our own day. What the blaze of triumph should light up, to an undazzled eye, is that long and laborious vista of possible advance in all the elements of great and glorious painting which opens before every genuine artist.

As an interesting contrast to the *Roll Call*, the spectator should notice the mob clearing off as the Guards march through the Park, by Mr. Barnard (684). This is an uncommonly lively character-sketch, pushed even to caricature and carelessness; yet full of clever incident and good touches of colour and drawing. It has a true expression of movement—a quality rarely realised, whether in painting or poetry.

Edward Frère, a name long loved in England, continues rather than advances his reputation by the three little works which he sends us: *Children teasing a Snail* (149), *The Woodcutter's Dinner* (214), *Children at a Stove* (1404). Of these the first seems to me the most successful, although the girl-nurse in the third displays the

painter's "gracious way." The effect of the other is rather forced; there is something of the look of Dresden-ware in the contrast between figures and background.—Why does not Mr. Walker give more than his elegant little outdoor scene (1,044)? Mr. Yeames, on the other hand, is over-liberal in subjects of a too-similar complexion: two half-empty churches, and two sets of flower-wreathing damsels (555, 510, 412). His largest picture is decidedly the best: three children appealing to the Florentine magistracy, I suppose, for mercy to a father (280). But neither this, nor Mr. Storey's *Blue Girls of Canterbury* (66), a pretty procession of little creatures, goes much beyond neat and dainty painting, success in which has so often proved a restraint on an artist's endeavours. The background of the *Blue Girls*, showing a part of the vast close which is one of the many splendours of Canterbury, is happily treated.

In this neat and dainty style of work Mr. Frith is a "passed grand-master," and he has displayed his talents this year on a life-size scale in several portraits of one girl: she appears here, always the same under different aspects, playing prettily at sleep, prayer, Pamela, &c., as the fancy takes her. The painter's manner in his well-known crowded figure-subjects has been long fixed. Like the famous comment upon the charge at Balaclava, Mr. Frith's style always makes one ready to say "Very clever, but it is not painting"—so keenly cut out are the figures, so neat and complete and essentially away from nature the faces and dresses, so ungraded the tints. The smart and lively groups in the *Blessing of the Children* (243) seem to be moving in a world without sky and air, so perfectly is the effect of atmosphere excluded. A more unpleasant quality is the pervading look of overdressed models; the too-frequent presence of an air of "vulgar gentility" about the figures, which, though it may be true to nature, is with difficulty to be rendered pleasant in art. This last element is even more conspicuous and disagreeable in the work of M. Tissot. Unlike Mr. Frith, he has a curious command over certain atmospheric effects, and certain limited relations of tone, together with a very neat and sure execution; but in the pieces now shown showy and ungracious faces and attitudes are not redeemed by happier touches, such as the pretty babies, who might surely with advantage, in such a subject, have figured more largely in Mr. Frith's picture. Of course there are persons as cross and self-conscious and empty as M. Tissot shows with great skill in his *London Visitors* (116), and *Ball on Shipboard* (690); but what is paltry and unpleasant in nature does not lose these characteristics by transference to canvas.

In this respect M. Tissot is the antithesis of Mr. Leslie, who, in his turn, has made his mark, and presumably fixed his style, by a persistent and brilliantly successful pursuit of the Pretty. Beauty, soul, expression—these are scarcely words which compel their way from our lips as we stand by his work; range of interest, passion, nature (in the natural sense), must be asked for with great discretion. If for an instant a worthy ambition leads Mr. Leslie further, as in the *Five o'Clock* (1,385) of this exhibition, the attempt to render a look of intense expectation becomes forced and unpleasant; the lady's anxiety is too undeterminate to rouse sympathy; we are not instructed whether to expect a boudoir tragedy or a boudoir triumph, whether a lover or a bankruptcy is imminent; and the eye goes readily to the lace and the china in which the painter's skill has found its highest success. The two girls making *pot-pourri* (129) exhibit Mr. Leslie at his best; he is here truly a master in his own domain, with dainty earthenware, and suburban rusticity, and those pretty damsels, ever fair and plump, and looking, in Lady Mary Wortley Montague's phrase, as if "literally made of lilies and roses," who, let lovers of the beautiful say what they will, are never likely to lose their popularity. Art has "many mansions," and there is room for this phase also; but when the real rose is in question, not the petal prepared for the *pot-pourri*

vase, the limitations of the style become obvious: witness the *Nutbrown Maid*, Mr. Leslie's other contribution (197).

In striking contrast with the group of artists just noticed stands one of our most remarkable younger figure-painters, Mr. E. Crowe. What I have spoken of above as *neatness*, in his work reaches the higher quality of *precision*; indeed, if I may venture so far in technical criticism, there is some tendency to over-definiteness in Mr. Crowe's figures, as one may also perhaps trace a determination in his style to render subjects in their nature unattractive, attractive by sheer force of painting. At any rate, the first of the two scenes from English "operative" life which he shows this year (the *Spoil Bank*, 537, a waste heap outside a mine, and the *Dinner Hour at Wigan*, 676) belongs, in itself, to the class just indicated. Both works are eminently thorough in every respect; but the latter, presenting a long line of lively girls at their hasty dinner out of doors on a bright morning, is decidedly the most pleasant. Two damsels together in the centre, and another with a can, are graceful with the gracefulness of real life. Others are somewhat stiff from the determined effort of the artist to reach actuality; but the whole has that indescribable and exquisite air of truth which, in one way or another, is at last the highest charm of art to the spectator.

Somewhat akin in character is the vigorous *Sailor's Museum* (1,332) by Mr. Stocks, with its "ancient mariner" displaying to a fine little boy some foreign wonder, whilst his own children look on, less at the wonder than the visitor. There is a little stiffness here and there in this work; some signs (I conjecture) that the art is not yet fully mastered; yet, on the whole, this is one of the most manly, humorous, and truthful incident-pictures of the year: may I venture to commend it to the notice of our illustrated papers as likely to be successful for one of their reproductions in colour? These Christmas pieces, if we think of it, carry ideas on art to a far wider public than the Academy. Are they not apt to run too uniformly in the groove of the merely pretty? Another figure-subject of originality and manliness in treatment, though rather "hard" in style, seems to be Mr. Barwell's *Perplexing Letter* (544); but it is hung too high for examination. And with this I may mention the *Norwegian Wedding* (641), by M. Tidemand, a Northern artist of distinction; also placed afar, and also containing much of merit in the way of good design and varied incident, if not presenting a whole of decided force.

These are but scanty notices of interesting work. There is, indeed, so much of it here, and the general level seems to me (if the non-artist may, with diffidence, allow himself such a judgment) so fair, that I must apologise for the mere mention of many figure-subjects worth study. Such may be the labourer and his family, by Mr. Stone (100), which (although the childless widow who looks on is in a less happy vein) rises, at least in attempt, above his former quasi-historical style through its greater vigour and largeness of treatment; Mr. Faed's *Forgiven* (227), an average specimen of his well-known domestic idyl; a group by Mr. Kennedy, *Found* (290), simply and effectively composed, but not sufficiently dramatic for the moment. Mr. Prinsep has a procession of tramps on the way to Newmarket (943); Mr. Wallis a group of two Venetian merchants surveying a bronze Cupid from Naxos (572); Mr. Morgan an *Address* to school-children (688)—the crowd shows some pretty and natural "motives." We may find cleverness and truth to real life in the *Pilots* of Mr. Dominy (711); and, though the subject is of a more artificial kind, in the *Curtsey* by Mr. Wynfield (444). The *End* (1,020), by Mr. P. R. Morris, is a pathetic and carefully-executed scene from the close of an old soldier's life, who returns, apparently, with his daughter to his native village. The sunset effect here is very pleasingly rendered. To the lively

foreign subjects by Messrs. Hodgson and Burgess allusion has already been made. There is also a clever-looking scene from Spain by Mr. W. H. Williams (1,320).

Mr. Millais's place—as the man who, of all his contemporaries, at any rate in this country, is most distinctively a "born painter," and without rival in the power of putting his subject on canvas in a masterly and pictorial manner—is so well assured, that any judgment which the non-artist can try to form upon the value of his works in other respects, must be accompanied by a constant and admiring recognition of such rare and precious gifts. These are not only prominent in his work, but their prominence often remains the leading and permanent impression. What is forced on us is the painter's power, not the grace, nor sentiment, nor poetry, nor power of his picture in itself:—we are rather summoned to survey a feat, than to enjoy a masterpiece. The girl reading to the old sailor in the *North-West Passage* (320) has great charm (though charm not sufficiently high or delicate in character to rise to beauty) in her face and attitude; the sailor's head and figure are painted with singular force and directness; the illustrative accessories have been ingeniously selected; yet, after all, the situation represented has rather to be put together and interpreted from what we have been told *ab extra* is the artist's intention, than is written unmistakably on the canvas. If the girl were absorbed in her book, and gently touching her father meanwhile to preserve him from the sense of isolation, would not what we see here be almost more appropriate than what we are meant to find? Story or no story, however, this is a group too effective to be soon forgotten. That the rendering of air and daylight are effective also need hardly be added: I am perplexed by the brownish and turbid look of some of the deeper shadows. The skill with which the sea and air through the open window have been put into their right place, neither slurred nor detailed, but suggested, should be noticed. It is one of the difficult problems of art how to handle objects which, in nature, require widely different focussation of the eye, and, at the same time, are in close juxtaposition.

Before turning to a few remaining figure-subjects, loftier in aim or more strong in pathos and poetry than those hitherto mentioned, three artists whose names are almost new to me remain, conspicuous for their aim at grace, more or less ideal in character, and not treated as an object by itself (a mode of art which soon ends in emptiness), but combined with the actions of common life. To this style I refer the *Covent Garden Market* of Mr. McLean (531), the *Waiting to Cross the River* by Mr. McNab (1,034), the three girls of Capri playing at knucklebones, by Mr. McLaren (948)—the latter two in the "Lecture Room."

There has been of late so little aim at art of this quality in England, that I may overrate here through the charm of a novel attempt; yet each of these pictures will, I think, at any rate be found worth careful study. In the *Covent Garden* we have a little procession of girls going forth with freshly-laden flower-baskets towards the (spectator's) right; the flowing lines of their drapery are contrasted with two or three figures on the left, which oppose them in attitude. Without abandoning truth to nature, either in the dresses or the features, Mr. McLean has given his figures a very pleasing grace and purity of form which, if a little too overtly antique, is yet nearer reality than an observer, untrained in the process of selection (that secret of the true artist), would imagine. Mr. McNab's piece is hung too high for more than an approximate judgment. A girl holding a rake stands upright, with a native grace of Grecian quality; an old woman and a child sit waiting for the ferry-boat. A simple landscape thrown into large masses lies behind. Here there is less open "classicalism;" yet the effect (a distant

effect, however, it must be remembered) is notably high and pure.

Mr. McLaren's picture is of a more complete and mature excellence. His three girls—lovely in the sense almost opposed to pretty (loveliness standing so immeasurably higher), with that novelty and yet intelligibility of attitude which are sure signs of natural truth delicately noted—at the same time show in every line a grace so refined and noble that I have found nothing in the Exhibition to rival it. The group might be transferred without change to an Athenian vase; nor, for a subject of this class, and setting aside colour, could I find higher praise. But absolutely first-rate oil-painting cannot set aside colour; and here the picture is, in fact, too near vase-treatment, from a want of richness in quality, and also because what colour there is seems to be reduced or lowered under some conventional system. Yet there are but one or two pictures more on the walls which to me have so much merit combined with so much promise.

One of these pictures, and that, indeed, the most striking of all, must conclude the present notice. *Applicants for Admission to a Casual Ward* (504), prefaced by a sentence from Mr. Dickens, to those who remember the general quality of the art to which that great but perilously-exemplar genius has been the inspiration, naturally suggests a work in which a forced style of sentimentalism would predominate. Such at least were the writer's anticipations, and the very sense of the high merits of Mr. Fildes' work which examination of it soon aroused, led me to watch more carefully for signs of the weakness to which subjects of this character are undoubtedly prone. One grave objection (presently to be noticed) may, indeed, be urged; but from this other fault, after repeated study, the picture seems to me free. In regard to the execution . . . my deep conviction is every year deepened that, in case of a painter of any real mark or ability, the unprofessional student can hardly express himself too sparingly or with too much diffidence on anything which falls within technical limits. The ultimate effect of a picture is for the world, to whom it is addressed, to judge; the technical processes are the artist's sphere and secret. Here the weakest painter who exhibits knows more than all the literary critics in London together. Hence in the case before us I may only ask with hesitation whether greater completeness and refinement of finish might not have placed the whole upon an even higher level. Passing this, we have here a truth and variety of character, a feeling for grace and beauty, of which the union in such a subject is certainly of the rarest. Abstract the mother and the two children in the centre (the group where the older child is lovingly guarding the little one) from the rest, divest them of raggedness and hunger, and the lines are lovely with almost the finest loveliness. It is to this union of wretchedness and beauty, moral and physical together, combined with the eminently unaffected and truthful rendering of the details, that the singular power—I will add, the singular attractiveness—of the picture seems to me due.

Is Mr. Fildes justified, judging by the severe yet only true standard—the standard of propriety to the final end of all art, high and lasting pleasure—in presenting a scene painful and moving in so high a degree? A man may preach never so eloquently and usefully, and yet his sermon may be a thing out of place. Here probably we are in a region where it is rash even to attempt decision. To me, the merits of the work as a pure piece of art, with the light and delight of tender feeling so abundantly thrown over it, completely justify the painter's choice. The reader will not find it lost time if he studies the picture sufficiently to frame his own verdict.

F. T. PALGRAVE.

M. THÉODORE CASSAGNAC, historical painter, has just committed suicide at Toulouse.

ART SALES.

At the sale of the pictures of M. S——, in Paris, on the 9th instant, the following prices were realised:—*Trois Moutons à l'Ombre d'une grande Roche*, Mdle. Rosa Bonheur, 7,300 fr.; *Marine*, Achenbach, 3,800 fr.; *Jeune Femme faisant de la Tapisserie*, Boldini, 6,250 fr.; *Danse de Nymphes*, Corot, 7,350 fr.; *les Laveuses*, Daubigny, 3,000 fr.; *Filleuse*, 4,200 fr.; *le Philosophe*, 4,700 fr.; *Intérieur rustique*, 4,500 fr.; *Bertrand et Raton*, 9,100 fr.; *Decamps*; *Hamlet et Ophélie*, 4,500 fr.; *Cléopâtre*, 7,250 fr.; *Lion*, 7,250 fr.; *Delacroix*; *Femmes turques*, 6,050 fr.; *Sous bois*, 3,400 fr.; *l'Affût*, 5,300 fr.; *le Printemps*, Diaz, 3,700 fr.; *le Soir*, Jules Dupré, 6,660 fr.; *Deux Gentilshommes*, Fortuny, 7,300 fr.; *Bords du Nil*, Fromentin, 9,000 fr.; *le Lion*, Gérôme, 6,900 fr.; *la Mal'aria*, Hébert, 9,000 fr.; *Déclaration*, Heilbuth, 3,950 fr.; *Après le Duel*, 9,000 fr.; *Tentative d'Enlèvement*, Isabey, 3,650 fr.; *Moutons*, Jacque, 4,500 fr.; *la Toilette*, Madrazo, 6,000 fr.; *le Reître*, Meissonier, 18,200 fr.; *la Baratteuse*, Munkacsy, 7,200 fr.; *Réhabilitation de la Mémoire de Liévin Pyn*, premier magistrat de Gand en 1541, Pauwels, 4,050 fr.; *Paysan hongrois*, Pettenkoffen, 3,780 fr.; *la Bénédiction de l'Abbesse*, Léopold Robert, 3,400 fr.; *le Rageur*, 6,000 fr.; *Après la Pluie*, Th. Rousseau, 5,000 fr.; *Pâturage*, Troyon, 15,500 fr.; *Moutons*, Verboeckhoven, 3,000 fr.; *Deux Cavaliers*, en costume de la Restauration, H. Vernet, 1,950 fr.; *le Miroir*, Willems, 6,900 fr.; *le Départ du Torrero*, Worms, 7,100 fr.; *l'Embarquement*, Ziem, 3,000 fr.

THE two little pictures by Meissonier in the French Gallery, Pall Mall, have been sold—the inimitable *Sign Painter* for 4,500*l.*, and the *Guard-room* for 4,100*l.*, and it is not too much to say for them that they are fully worth the money. The *Sign Painter* was painted, we understand, some six or seven years ago.

MESSRS. CHRISTIE announce for sale on June 12, the property of a noble Earl, a set or garniture of three pieces of Sèvres porcelain, the centre in form of an ancient galley, "vaisseau à mât," as figured in Marryat's *History of Pottery and Porcelain* of rose du Barry and green. The other pieces are two fan-shaped (éventail) jardinières exquisitely painted in subjects with borders of rose du Barry and bands of green. There is no truth in the rumour that 10,000*l.* has been already offered for them, but there is no doubt that they will fetch a price commensurate with that realised by Mr. Goding's vases.

ALTHOUGH the gift of the late Madame Le Noir to the Louvre, of snuff-boxes and ancient miniatures was estimated at 20,000*l.*, yet there still remain valuable objects, diamonds, &c., to occupy eleven days' sale at the Hôtel Drouot. It began on the 18th inst. Among the paintings may be cited some charming productions of Pater, the *Fortune Teller*, and a landscape by Boucher, and some rich compositions of Demarne, Robert and others. In addition to the extensive collection of works of art, are the jewels, the sale of which alone will occupy four days, and among them a remarkable "rivière" composed of a triple row of the finest brilliants, consisting of 103 stones.

THE magnificent works of art belonging to the late Mr. Barker are now on private view at his house in Piccadilly. His choice collection of maiolica he had disposed of some time before his death, but he was no less distinguished for the important and rare pictures he had collected of the great Italian schools. Interesting works of P. della Francesca, Botticelli, Credi, Pollajuolo, Verrocchio, and Signorelli; *The Return of Ulysses*, by Pinturicchio; and a series illustrating the story of Griselda, by the same master. Also pictures by C. Crivelli, Signorelli, Carpaccio, Hemmelinck, the celebrated Giorgione of the Manfredi Palace, and numerous others, many known to the public by their having been exhibited at Leeds and Manchester. The drawing-

room has eight panels most exquisitely painted by Boucher for Madame de Pompadour's château at Créci, engravings of which are lying on the table. The house is a perfect treasury of art, as yet undisturbed by the sacrilegious hammer of the auctioneer. The furniture is of extraordinary beauty. Venetian state chairs gorgeously carved with figures, lyres, or other designs, and covered with satin embroidered in colours, or with the richest Genoa velvet. Venetian looking-glasses and chandeliers, cabinets and other furniture of tortoiseshell, boule, and marqueterie of the finest French execution of the Louis XV. and Louis XVI. periods, Sèvres vases of "Duplessis" and other forms, Capo di Monte porcelain, amber caskets, Italian and French bronzes, clocks, ivories, rock crystals; such an amount of splendid objects, filling the four floors of the house, has rarely been brought together. The sale begins at Christie's on June 6.

THE enormous prices fetched by the roughest sketches and hasty jottings in note-books at the Landseer sale will astonish even those who are used to the appreciation now accorded to the slightest efforts of any master whom the world has agreed to call "great." This appreciation is not altogether false, for it is probable that the slightest sketch of such a man, however hasty it may appear, is the outcome of years of patient study and trained observation, and so will have more worth than the carefully executed work of an inferior master. The sketches in pen and pencil, water-colour drawings, slight oil sketches and other works, that occupied six days in their sale last week at Messrs. Christie, Manson & Woods, may be regarded as the rough material out of which the genius of the master composed his more important works. His studies are always fraught with interest, for in the rudest of them we may see the mind as well as the hand of a great artist. Often, indeed, the thought is more clearly visible in the first rough sketch of the artist's idea than in its elaborated execution. The prices fetched by the Landseer sketches have been stated in most of the daily papers, and need not be repeated here. The total sum realised by the six days' sale was 60,000*l.*, out of which it is said that 40,000*l.* will be paid by the well-known and enterprising firm of Messrs. Agnew & Sons.

NOTES AND NEWS.

A NOTEWORTHY exhibition was opened to the public at the Royal Institution, Manchester, on Wednesday week. It consists of a loan collection of pictures and drawings, which have been got together from the houses of some six or eight Manchester gentlemen. It is an indication of the great wealth of the northern city in works of art that more than half of them are from the galleries of one man, Mr. Thomas Ashton.

There are about eighty pictures in oil, forty water-colours, and forty-two pencil drawings by Maclise. Those who were familiar with the Manchester Art Treasures Exhibition of 1857, will find many of their favourite pictures in this collection.

Turner is represented by some of his best pictures. There is the well-known *Barnes Terrace, on the Thames*, with the black paper dog on the parapet; *Walton Bridge*, in water-colours; and an early drawing, *The Roman Bridge at Avignon*. There are two pictures by Constable, *Flatford Mill*, a good example; and the great *Salisbury Cathedral*; and four by Müller, including the famous *Baggage Waggon*. There are also Frederick Walker's *Harbour of Refuge*; *Una and the Red Cross Knight*, by G. F. Watts; *A Midsummer Night's Dream*, by R. Dadd; *The Entombment*, by Scheffer; Mulready's *Punch*; Hunt's *Claudio and Isabella*; a tender little idyll by the late George Mason, *Children Fishing*; and good specimens of Eastlake, Calcott, Creswick, Webster, Cox, Hunt, and others.

A NEW resolution has recently been passed in France relating to the organisation of the National Museums, and has been followed up by a decree from the Minister of Public Instruction, regulating the internal administration of the Louvre and the other National Museums, all of which are placed under the superintendence of the Directeur des Beaux-Arts. Several articles of this decree have special reference to the complaints that have been recently urged concerning the mismanagement of the authorities at the Louvre, and the inefficiency of the Conservatoire—complaints with which the ACADEMY sympathised some time ago. It is now provided by art. 4 of the decree, "That no gallery can be opened or closed, no object added to or taken out of the galleries, nor any radical change made, without the authorisation of the Director." This will doubtless remedy one of the evils that have been pointed out—namely, that works of art were displaced from their positions, and consigned in many cases to obscurity at the will and in conformance with the taste of the head of the particular department to which they belonged. Art. 5 moreover decrees that "Each conservator shall classify the collections committed to his charge, shall have an inventory made of them, and shall publish a catalogue of the objects exhibited;" and also (art. 6), "that a catalogue in course of sale cannot be suppressed except by order of the Director. At the same time, the conservator in office shall have the power of drawing up a new catalogue in accordance with his personal views, but its publication shall be made as far as possible to accord in time with the exhaustion of the previous edition." It is doubtless due in a great measure to the reiterated complaints in the public press that these new regulations have been framed, but M. de Chennevières, the present Directeur des Beaux-Arts, is a new broom in his office, and as such is of course specially anxious to sweep down the cobwebs left by his predecessors. There have been endless decrees and regulations concerning the administration of the fine arts made in France under the present Republic.

THE last bronze plates belonging to the shaft of the Vendôme column have now been fixed. The bas-reliefs on them represent the battle of Austerlitz.

THE *Nation*, in an article on the "National Academy Exhibition of New York," says that the present year has broken up a most mischievous legend—that, namely, which taught that publicity in the exhibitions of the Academy was damaging to the pecuniary success of a picture. Most of the painters are represented, instead of being conspicuous by their absence as in past years. The public also "have broken their bad habit of attending simply once, in a large, opaque, blind mass upon the opening night, and studiously absenting themselves thereafter."

WE are led to infer from the general tone of the criticisms which have appeared in the German papers of the recently opened Exhibition in Vienna, that the collection falls this year rather below the average standard. The International Loan Department of the Exhibition is pronounced to be especially indifferent in quality, and insignificant in regard to numbers. Landscapes and portraits preponderate; of the former, the best have been contributed by Professors Lichtenfels, Schäffer, Hoffmann, Russ, and Obermüller, all of whom have maintained their reputation for vivid and truthful rendering of the special natural features which they make the subject of their works. The general opinion, both of the public and the critics, seems to be that among the foreign or other German exhibitors, Oswald Achenbach alone has contributed a landscape worthy of commendation. *The Strand at Naples*, by this artist, is, however, admitted to be of very great excellence. The best portraits are by Makart, Angeli, and Griepenkerl, the first of whom is known as the most brilliant of German colourists; while the second, who is

represented by an admirable portrait of his wife, shows here, as he does in the portraits of the Imperial Crown Prince and Princess of Germany, in this year's exhibition of our Royal Academy, a harmony of design and a dignified repose in his mode of treatment which may be said to characterise most of the works of this accomplished artist. Sculpture is only feebly represented this year at Vienna, although a few works form an exception to the general mediocrity, as, amongst others, an excellent bust of Rokitsky, the anatomist, by Victor Tilgner, and a group in relief by Otto König.

A FARMER in Slagelse, Denmark, has ploughed up in his field a beautifully preserved gold cup, of Byzantine workmanship. According to *Berlingske*, this remnant of the days when the Vikings spoiled Micklegarth will be secured for the Oldnordisk Museum in Copenhagen.

A SPANISH *savant*, who has long been occupied with archaeological researches in Central America, has just returned to New York with an important collection of Mexican antiquities. Among them is a figure of Cucumaz, the god of the air, in reddish-brown porphyry, about two feet high, and eighteen inches in diameter. Its shape is that of a feathered serpent; its mouth is wide open, and from it issues a female figure of a type not now to be met with in Mexico, but much resembling the sculptured heads which occur on ancient monuments in Egypt. Another interesting object is a head carved in black stone, representing a negro, the features, shape of the head, and conformation generally being of a purely Egyptian type. These little figures, according to the *Journal Officiel*, to which we are indebted for these details, are admirably sculptured and exquisitely finished, although their worshippers were undoubtedly ignorant of the use of iron. Every day, adds our authority, seems to bring some fresh proof that the American continent at different periods long before the days of Christopher Columbus received visitors and colonists from the Old World.

A COMMITTEE of artists, art-critics, and others, has been appointed at Berlin by the Minister for Home Affairs, to consider the question how plaster casts may be best preserved from the action of weather. The committee, which includes among its members several practical chemists, has reported that it does not believe such statues will be preserved by means of painting or varnishing. It is not agreed as to the best methods of effecting the desired end, but it is of opinion that the object can only be attained by blending some preservative agent with the plaster of Paris before the statue is cast, and in the acknowledged uncertainty as to the best means of doing this, it invites discussion, and proposes to make the question the subject of a prize essay.

THE King of Württemberg has sent Kaulbach's original *Battle of Salamis*, his *Anacreon*, and several other pieces by the great German master, to be exhibited with the remainder of the collective works in the Kaulbach Exhibition now open at Nürnberg.

It appears that a portrait of the Comte de Chambord was sent in for exhibition at the Salon, but was withdrawn by the Comte directly he found that he found that his interesting young rival, the Prince Imperial, would be represented on the same wall as himself: "Au dernier moment," says a French paper, "M. de Chambord, le prétendant du drapeau blanc, n'a pas voulu faire pendant au cruel portrait du jeune garçon de Woolwich." May we venture to suggest that a national portrait exhibition of the various aspirants to power in France would be likely to prove attractive, and might be useful as a safe outlet for excited party feeling?

A LARGE and important fresco has recently been scraped free from the whitewash of centuries in the church of Santa Maria Maggiore, at Bergamo. It represents the tree of St. Bonaventura, on the

branches of which are depicted the fifteen mysteries of the life of Christ, with the crucifix at the summit. Another person is kneeling near the Saint, probably the donor of the picture. The work is said to be very carefully and minutely finished, and is referred to some artist of the fourteenth century.

A CONSIDERABLE number of pictures and studies, all of them the work of the deceased landscapist, Chintreuil, have just been on view at the Beaux Arts, and though neither as regards imagination nor execution are they at all of the first rank among French modern Art, they have much interest, partly for the very reason that they show how much of truth and beauty there may be in work which is still only second-rate. Chintreuil was a painter of limited range and unequal execution. At best, he had no strong personality; at worst, he did what only too many others could do as well. Of course he had his preferences, and these were for the country when it is green in spring-time. He has brought before us many a copse in May, and many a meadow, and many an orchard-close. These things, and their habitually pleasant effects, he painted with great truth and love, but he was never quite great enough to seize nature in her chosen moments. The level of his work, though high, is not of the highest. One does not remember a particular picture, but rather that there were many pictures which were very creditably done.

THE *Chronique* of May 9 gives its readers a foretaste of a work which M. Champfleury will shortly publish, entitled *Histoire de la Caricature sous la République, l'Empire, et la Restauration*, by printing a chapter from it, which contains an excellent and appreciative criticism of Gillray. The chapter is called "La Révolution française jugée par Gillray," and we know how Gillray judged the French Revolution. He was of the same mind as his Independent Citizen, who says, "I don't like wooden shoes, frogs, or Frenchmen." His French critic, however, kindly excuses these little errors of patriotism, and says that "in judging the work of the Scotchman he tries to forget he is a Frenchman."

M. CHARLES COURNAULT, a well-known writer on art, and contributor to the *Gazette des Beaux-Arts*, M. Auguste Herst, a professor of drawing, and M. Octave Teissier, a member of the Committee for Historical Works at Marseilles, have, it is announced, received the decoration of the Légion d'Honneur. Why?

THEY have begun at the Louvre the restoration of the four paintings of Lebrun, representing the battles of Alexander, which hung in the Pavillon Denon, the mark of the batteries of Père la Chaise during the last days of the Commune. Several shells penetrated the building, and injured Lebrun's paintings, one of which, *The Passage of the Granicus*, has been taken down, so that the extent of the injuries can be ascertained.

THE United States Centennial Commission propose to make a portion of the buildings necessary for the Exhibition of 1876 in Philadelphia a permanent structure to be called the Memorial Hall, which shall remain in commemoration of the hundredth anniversary of the National Independence. There is a plate of the proposed building in the March number of the *Journal of the Franklin Institute*.

M. HELBIG draws attention in the new part (April) of the *Bollettino dell' Inst. Corrip. Arch.* to certain figures of apes carved in amber, found in the most ancient stratum of Etruscan cemeteries, and instances one specimen found at Cervetri, and now the property of Sig. Augusto Castellani. The species being the *Macacus rhesus* peculiar to India, the question rises as to how the Etruscans could have made the acquaintance of such foreign creatures at a time so remote as is indicated by the circumstances in which representations of them are found. M. Helbig concludes that this

took place through the medium of Phoenician traders; and it is curious, as he points out, that besides gold, silver, and ivory, the ships of Tharshish brought once in three years to Solomon apes and peacocks (1 Kings x. 22; 2 Chronicles, ix. 21). It is therefore easy to believe that the Etruscans also imported apes from the East, and they could only have done so through the Phoenicians. Similarly, it appears to have been the Phoenicians who imported into Etruria those shells, *Tridachna squamosa*, peculiar to the Indian ocean, which are occasionally found with Etruscan designs engraved on them, and of which there is a fine specimen in the British Museum. And again, the ostrich eggs, bearing Etruscan designs, found in the very ancient tomb at Polledrara, near Vulci, and accompanied by objects in Egyptian porcelain, must have been brought from Egypt by this same medium.

THE recent Report of the Historical and Archaeological Society of Ulm contains an account of a picture of Charles V., surrounded by emblematic and allegorical devices, which was formerly in the possession of the family of the Ehinger, of Ulm, to an ancestor of whom it had been given by the Emperor as an acknowledgement of the reception awarded to him in their house. It is to be photographed, but it is feared that the dark ground on which this really admirable portrait is painted will present great difficulties in the way of securing a good copy.

At a meeting of the Society held last month, attention was drawn to the discovery of a grave-stone, brought to light during the recent excavations of the Münster Platz at Ulm, on which were inscribed, after the words "Cunrat riter," the date 1388 in Arabic cyphers, which is the earliest instance on record of the use of those foreign numerals in this part of Germany.

THE Stuttgart journals report the discovery in that city at the end of last month of a relic of antiquity in the form of a sculptured lion. The figure, which is of life size, exhibits the animal couchant, and holding between his paws a portion of the body of a deer. It is carved in grey sandstone, and was found on the left bank of the Neckar, between Lustnau and Kirchentellinsfurth. Both in regard to the material and mode of its execution it betrays a Roman origin, although, according to the opinion of those archaeologists who have examined it, it is identical in character with the two stone lions, holding human heads between their paws, which were found in 1869 at Neuhausen. These figures were conjectured to have had some connexion with religious symbolism, and to have belonged to that form of Mithraic cult in which the gold-maned lion was accepted as an image of the bright Day, which according to the myth overcomes and swallows up darkness.

THE STAGE.

"L'AMI DES FEMMES" AT THE GYMNASE THEATRE.

L'Ami des Femmes, just now revived at the Gymnase Theatre, would be a great comedy if it were only a natural one. Following close upon *Le Demi-Monde*—the piece in which its author represented not that society which the title has since been employed to describe, but the world of new nobility and new finance with which the true *Monde* of the Faubourg St. Germain would have nothing to do—following close, as one remembers, upon *Le Demi-Monde*, *L'Ami des Femmes* was the first milestone on a downward road. In it the author, who until then had been content to be an observer, began to pose as a philosopher, and Monsieur Dumas had been studying physiology, and the result was the production of a piece in which the subject itself was extremely audacious, though the treatment was thoroughly moral. Its audacity might have been the more readily pardoned if the thing had been natural; but as it was very unnatural indeed, the fault must be pardoned only in virtue of the good intentions of the author. And the good intentions of the author have in-

deed some claim to be remembered when one hears a little too much about his audacity. A happier generation, if it occupies itself at all with his work, will probably say of it that his philosophy was false or inexplicable; his very aim less worthy than he believed it; his result less worthy of all; but that in an age when ability was chiefly used to make a popular success, he used it chiefly to make a literary; and that he did recognise the diseases of his time, though the medicines with which he sought to cure were often only such as could aggravate.

Jeanne de Simerose is a very young wife, who is separated from her husband on the ground that his love for her is not of that wholly ideal kind which the education of her convent and the lessons of her mother had taught her to expect. This starting point itself is sufficiently unnatural, though justified by the best of the author's ingenuity; but that which is most unnatural follows afterwards, and that is the character of M. de Ryons, whose speciality gives a name to the piece. This is a gentleman who, to use his own expression, studies women as others study *coléoptères*, and thinks them on the whole more worthy of a savant's devotion. He would be possible were he himself, like M. Dumas, a professional writer; but as an idle man, he is an impossible person, and more than ever impossible, when by his own avowal, he mixes up friendship with his studies, and dividing women boldly into two classes, "celles qui sont honnêtes et celles qui ne le sont pas," says that it is his mission to "guarantee" the first, and to "console" the second. At the house of Madame Leverdet, a common friend, this impossible M. de Ryons meets Jeanne de Simerose. Eventually he does for her that which he may well enough do as an exception, but which cannot be the rule of his life—he reconciles her to her husband, who is, after all, a very worthy fellow. Did he proceed to do this simply and directly, being fully informed of the circumstances, it would be natural enough; but he is *not* fully informed of the circumstances, and it is only as the result of his efforts to "guarantee" M^{me}. de Simerose that he is at last informed of them, and informed of them by herself; and though this scene, like every other great scene of the comedy—the confession, one may call it, of virginal M^{me}. de Simerose—is led up to with an ingenuity, a fertility, a power of construction, the like of which we do not see upon the English stage, it is still felt to be an unnatural one. It is not to a man, even under circumstances of the greatest provocation, that such a story would be told by such a woman. Jeanne de Simerose, were she no longer that which she was when she left her husband's house in the first days of their marriage, might, indeed, have told that story; but it must have been to a lover, and he, one supposes, would have done his part in assisting the narration. But Jeanne de Simerose, always the same, wounded and stung by the discovery that the love of a lover, M. de Montègre, is no more wholly ideal and sentimental than was that of her husband, Jeanne de Simerose, under that provocation, could never have told her story to the unstirred *ami des femmes*.

Accordingly, it is a difficult play to act, and though at the Gymnase the actors play into each other's hands—becoming now predominant, and now subordinate, as occasion requires—in a way which lends the appearance of truth, where truth itself is wanting, yet much is lacking to the individual interpreters of the work, and this is felt especially in the case of M. F. Achard, whose business it is to represent *l'ami des femmes*. He does not, in the first place, look the part. He is, or appears to be, too young for it, for though M. de Ryons himself was young—thirty-two, the piece informs us—we may be very sure that he looked older and that he looked wiser. M. F. Achard has no appearance of wisdom; and instead of looking a minute and devoted student either of women or of coleoptères,

he is, *tout bonnement*, a young man of the Boulevard, without individuality, without characteristics. If one says of him that he plays with ease, that is all that one can say. His delivery, clear, of course, and sufficiently polished, is without point. The sharp things with which Dumas has filled the piece—thinking, perhaps, that wit was bound to sustain it, if it could not be sustained by probability—do not seem as sharp when M. Achard says them as when one reads them in the volume. M. Villeray is much better as the husband—a young man whose fault was chiefly that his love was not wholly platonic. If he lacks the distinction of Pierre Berton, who created the part, he is probably the truer for lacking it. With the impetuous, somewhat common-minded, but fairly honourable lover, M. de Montègre, played by a well-known Gymnase actor, M. Pujol, no fault is to be found. He presents you with a portrait of a type, while M. Derval, as old Monsieur Leverdet, Member of the Institute, presents you with the portrait of an individual. The family of which Monsieur Leverdet is a member—nay, of which he is the nominal head—is intended by M. Dumas to be the subject of a curious study. But after all, though it is very well done, and very morally done into the bargain, this *ménage à trois* is not original. We have met before with the permitted friend who abuses the cook and still dines every day, and with the woman who submits to the dictation and works slippers for the feet of the dictator. But what is perhaps new—or was, at all events, new when the comedy was first produced—is the *ennui* which reigns in this family, of which the husband—stupid, indeed, but busy at the Institute—is the only happy person. What would not the permitted friend give!—what would not the wife give!—after several years of acquaintance, to have an interest in life half as vivid as that which M. de Leverdet takes in the questions of how to make "de l'alcool avec du charbon de terre et du sucre avec de la sciure de bois"; and who, when these great problems are solved, will have another resource: "Après . . . nous chercherons autre chose, et ainsi de suite," while the lady complains of rheumatism, and the permitted friend of sciatica.

But that which, apart from the literary merit of the piece, makes the piece well worth seeing as it is now performed, is the representation of the heroine, Jeanne de Simerose, by M^{lle}. Blanche Pierson. Her performance is not completely satisfactory; she has not found—she has not been able to find—the key-note found nine years ago by Delaporte, but her acting is full of life-likeness and individuality. They are the troubles, the longings, the irritations of a real woman, and a very sensitive one, that she represents; and the fault for this character of Jeanne de Simerose is that they are too *much* those of a woman, to little of an inexperienced girl. Rarely, then, has there been seen a performance at once so mistaken in its conception and tone, and so vivid, natural, and finished in its execution. Here and there, one says, that cannot be Jeanne de Simerose, but it is a person far more natural and alive than Jeanne de Simerose could ever have been. As she enters, and greets her friends, and takes M^{me}. de Leverdet's little girl under her care, and talks to her encouragingly and wins at once her confidence, there is the easy grace which M. Dumas speaks about; but of course it is later on, when she is giving a rendezvous to M. Montègre, when she is combating the first efforts of M. de Ryons to learn her story; when she is with difficulty concealing her affection from her husband, who comes to her on a matter of business; when at last, stung by misconceptions without end, she tells her story, with restraint and pain—it is at these times that there are evident a quick and keen intelligence and a sympathetic power, second to none, as it is now admitted, on the Paris stage. Attitude, gesture, facial expression—all do their part, and do it constantly—and you have before you, from beginning to end of M^{lle}. Pierson's

performance, the troubles, the annoyances, the innocent pleasures, the intimate life, of a woman who inherits the sensitiveness of an over civilisation, without inheriting its disease. And why, one may ask, has this talent—this untiring study from the life—been admitted only within the last three months (since *Monsieur Alphonse*) and not for the long years during which it has been as plainly in evidence? Alas! M^{lle}. Pierson is a prophetess who has stayed at home, and has accordingly been for years without honour there.

It is an unfortunate thing for a Parisian actress never to have been to St. Petersburg. Reputation, like wine, wants a voyage to mature it, and if an actress of the Boulevard cannot go to St. Petersburg, she should at all events on no account omit to duly telegraph her successes in London or Brussels. All this the actress who now leads at the Gymnase, where for years she only followed, neglected strangely to do. Delaporte was before her, Desclée was before her, Pasca had a serious talent; and while this actress's gowns had a *succès de enthousiasme*, her art had only a *succès d'estime*. Then the turn came. There is no reason to suppose that M^{lle}. Pierson was more worthy of remark in *Monsieur Alphonse* than in the many pieces in which the public had found her nothing more than pleasant—those who know her acting best tell me she was finest of all, with Desclée, in the second rôle of *La Princesse Georges*—she is not better, but the public is more alive, and also, the stage is clearer. This last reason points at the saddest feature in professional life—whatever may be the merits of many, there is not room for more than the success of a few. But in Paris, as it is generally allowed, the few are too few just now. Important positions are held by players at the Vaudeville, and even at the Gymnase itself, by players whose only claim to keep them is the absence of good rivals. FREDERICK WEDMORE.

"ARCHIE LOVELL" AT THE ROYALTY THEATRE.

ARCHIE LOVELL is one of the sweetest characters of modern fiction. She belongs to the class of figures which imaginative writers love to set up as unconscious champions of the inner verities of life against its outward forms, beings whom the disciples of Rousseau might hold to be waifs and strays from the original state of nature, and who range from Rosalind and Imogen down to Mimi Pinson and Murger's Musette. And though Archie Lovell has not the vital signs which are found in many of her distinguished sisterhood, rather representing a type that will become as unnatural in a hundred years as that of Evelina and Cecilia has become to-day, yet Mr. Burnand has done very well to prolong her existence while she may be thoroughly appreciated, and to draw her from the airy regions of the imagination to the more solid ground of the stage. He has not been able to do this without detriment to the creation of Mrs. Edwardes, nor without violating the integrity of her story. It was probably his desire first to construct a complete and symmetrical play which should fulfil the requirements of the stage, and then to work in as many of the original characters as the frame would admit. He has found place for some of the best of them: such as Mr. Frederick Lovell, the amiable dilettante, who had entered the Church, but preferred to a clerical life a career of vagabondage through continental towns, living under an assumed name among artists and Bohemians, dreaming of the fame that would come to him when his picture *Troy* was exhibited at the Academy, and his *Lays of Rome* received in Paternoster Row, and content meanwhile to hunt for Sèvres and bronzes and Madame de Pompadours, feeling almost as much sorrow for the degeneracy of Boule, who in his later years lowered his splendid talent to mother-of-pearl, as for the shortcomings of his daughter Archie; such as Bettina, his second wife, a dowdy little woman, babbling of dukes and duchesses, and aspiring to outdo Madame the Souspréfet of Morteville-sur-Mer, yet ruled in-

periously by Archie; Gerald Durant, the facile Guardsman, purposeless and vacillating, and yet, as Jeanneton the servant said, "Un monsieur, mais un petit monsieur très très comme il faut;" Major Seton, the old moustache, who had loved Archie since he played with her, a child of eleven, in the Villa Andreo at Genoa; and the ingenuous heroine herself, wilful as when she made her father rise at five in the morning to carry her round the Alt Markt of Dresden, beautiful as when she sat as model for peasant children, nymphs, and contadinas in half the ateliers of Italy, and true in heart as at all times. These characters, and more, have been introduced by the dramatist, and yet much of the fragrance of the novel has vanished.

This is in great measure due to the slightness of the framework. Readers of the book will remember that the freak which leads Archie Lovell to make a day's excursion from Morteville to London in the company of Gerald Durant was merely a link in the chain of circumstances connecting the latter with the death of Maggie Hall, the country girl whom his cousin Robert Dennison had married, and whose disappearance from Durant Court had brought Gerald into disgrace. This main fact of the novel is suppressed in the play, which is concerned with the love of Archie Lovell and Ralph Seton, a love which was born in the oleander thickets at Genoa, which blossomed in an Indian bungalow where the picture of a child, "brune aux yeux bleus," cheered for six years the solitude of the soldier, and which nearly withered away when he returned and found Archie apparently eloping with Gerald Durant. The playwright strengthens the case against her by interpolating an act in which the girl swears to Ralph that she has not seen Gerald since the day of the excursion, and is at that moment accidentally confronted by the man himself; but even with this addition the material is inadequate to sustain the comedy. An entire act is devoted to the embarkation of Archie and Gerald at Morteville, a second to the recognition of Archie by Major Seton; and with a view to this recognition two otherwise superfluous and wholly uninteresting characters are invented by Mr. Burnand. It was no doubt wise to omit from the play the vampire brood of scandal-mongers at Morteville, who, if as black as Mrs. Edwardes painted them, would be as much out of place in a modern comedy as Mother Shipton or the Witch of Edmonton; but it was a pity to replace them with two such veterans of the stage as a cheery but jealous doctor and his strong-minded but coquettish wife. And it cannot be said that the deficiencies of the story are compensated by any uncommon development of character, any subtle analysis of human nature; but the play is no worse in this respect than most productions of the present day.

The part of Major Seton is acted by Mr. George Rignold with singular excellence. Ralph Seton, "seamed with an ancient sword-cut on the cheek, and bruised and bronzed," is drawn in strong contrast to Gerald Durant. When a boy he lost his teeth in defending a woman in a street-quarrel; when a man he learned that his father was ruined, and determined not to enter on his estates till the debt was cleared, so he obtained a commission, had his head cut open at Inkerman by a Cossack cuirassier, and was sent to India for six years. When he returned he found that the little girl he met in Italy had grown a woman, and found, or fancied, that her heart was given to a young gentleman with a handsome *malerisch* face who sang and quoted Alfred de Musset. His struggles to put the thought of her away from him, his alternations between severity and affection, the latter eventually winning, are very carefully marked in Mr. Rignold's laudable performance. If in his roughness there is a memory of the actor's former impersonation of Caliban, so in Miss Henrietta Hodson's representation of Archie Lovell there are reminiscences of her playing as delicate Ariel. Not that Miss Lovell is for a moment to be compared to the tricky

spirit save in naughtiness; but the artist brings the same frolicsome humour to her conception of both characters. Nor does she forget to show that under the frivolity of Archie's manner, with all her scraps of Italian songs about republicanism and liberty, and her strolls in the moonlight on the sands at Morteville, smoking cigarettes and wearing her father's hat and coat, there is a warm and innocent heart. Of the rest of the company the most conspicuous is Mr. Peveril, appearing as the cardsharp Captain Waters, whose connexion with the play is of the slightest. More of the dialogue might with advantage have been borrowed from the novel, but it is of a respectable order throughout—neither very meagre, nor very impertinent, nor inclining to the vein of King Canbyses.

WALTER MACLEAN.

WE understand that Mademoiselle Croizette is the daughter of a French dancer, who danced in Russia. She is sister-in-law of M. Carolus Duran, the well-known portrait painter, and she was duly trained as a governess, but found the stage an irresistible vocation.

SARDOU's last popular comedy, *L'Oncle Sam*—a disagreeable and exaggerated satire upon American women—was not licensed during the Administration of M. Thiers. His successors licensed it, and it was a commercial success. "That I can quite understand," said M. Thiers—talking to a portrait-painter—"on paie très-cher les portraits très-peu ressemblants."

A NEW play, by M. François Coppée, the poet, has just been accepted at the Paris Vaudeville.

M. PAUL FERRIER's *Tabarin*—the two-act comedy now being rehearsed at the Théâtre Français—contains a good part for Coquelin. The other rôles are unimportant ones.

AT the Français they have just begun the rehearsals of *Le Zaire* of Voltaire. M. Pierre Berton and Mdlle. Sarah Bernhardt are rehearsing in this piece.

THE *Jean de Thommeray* of Messieurs Emile Augier and Jules Sandeau contained, as the reader may remember, one character such as has rarely, if ever, before been presented on the boards of the Théâtre Français. The explanation is that the piece, until within a very short time of its completion, was meant for the Theatre of the Porte Saint Martin.

AT the Théâtre de Cluny they have soon withdrawn M. De Launay's version of Balzac's *Cousin Pons*—which was not well adapted for the theatre—and they have substituted for it the well-worn but continually effective *Closerie des Genêts* of Frédéric Soulié.

SARDOU's *Ganaches*, at the Paris Vaudeville, is drawing large audiences, though it is now but indifferently acted. The heroine's part is played with much exaggeration, and the actor who has come from Russia to replace Lafont has not succeeded in throwing Lafont's memory into the shade.

It is doubtful whether Desclée's letters—in the possession of M. Alexandre Dumas—will suffice to make a volume, especially when there have been subtracted from them some which are too intimate for publication. Of these last, one, which is particularly remarkable, was written only a very few days before her death to a friend of M. Montigny's, who consented to be her executor.

THE old Royal Theatre of Copenhagen is approaching its last days. The almost sacred building where Hans Andersen made his childish *début*, where Øhlenschläger was crowned and glorified, where Thorwaldsen passed away in death, will be closed on June 1, and almost immediately afterwards pulled down. It is hoped that the handsome theatre that already rises at its east side will be ready by next season. The acting is a little less brilliant than in the days of Phister and Fru Nielsen; but Wiehe, Fru Nyrop, and Fru Erhard-

Hansen ably support the reputation of the house. Certainly in not one of our English theatres is such exquisitely-combined acting, modest and satisfactory in all its divisions, to be seen as here in Copenhagen.

ON Monday the Court Theatre will produce a comedy, by Mr. Frank Marshall, called *Brighton*, and founded on Mr. Branson Howard's American play *Saratoga*. To-night, at the Vaudeville Theatre, a new travesty of *Guy Rammerey*, by Mr. F. C. Burnand, will be represented. Mdlle. Favart will continue to play in *On ne badine pas avec l'Amour* at the Princess's Theatre till Tuesday next, when she appears in M. Augier's one-act comedy, *Le Post-scriptum*, and in *La Nuit de Mai*. M. Got will commence his six performances on Thursday in *Le Gendre de M. Poirier*. Mr. Wills's historical play, *Charles the First*, will be revived at the Lyceum Theatre on Monday, June 1, Mr. Irving appearing as the king. The performers who represented *La Fille de Madame Angot* at the Gaiety Theatre will next week transfer the opera-bouffe to the boards of the Globe Theatre. *Mont Blanc*, the new comedy at the Haymarket, will be produced on Monday next.

THE Alhambra Theatre has represented with great success the English version of *La Jolie Parfumeuse*. The French libretto was remarkable for nothing but indecency; the English book is not even indecent. But the music of M. Offenbach is flowing and graceful, and several of the numbers, such as the finale of the first act and a brindisi in the second, will catch the popular ear. And as the performers sing and act with unusual spirit, the extravaganza will doubtless prove very acceptable to the large class of persons who enjoy this sort of entertainment.

A MORNING performance will take place to-day of Mr. H. J. Byron's successful comedy, *An American Lady*. This play deserves further notice than we have yet been able to give it, being written in excellent style and with good knowledge of dramatic effect; and the principal characters being very well played by Mrs. John Wood and the author.

MR. J. W. ANSON, treasurer of the Adelphi Theatre, had a benefit on Thursday last, when a large number of the theatrical profession lent him their assistance. The benefit of Mr. J. L. Toole, who is going to America, took place on Thursday and Friday, Mr. Toole appearing in some of his best-known characters, and Mr. Henry Irving reciting a poem called "The Uncle." The last-named actor will read a descriptive piece named "The Last Days of Herculaneum," at a complimentary performance given to Miss Isabel Bateman, on Saturday, May 30.

MUSIC.

NEW PHILHARMONIC CONCERT—MDME. ESSIPOFF. It is not often that we have the opportunity of chronicling a *début* so completely successful as that of Mdme. Essipoff at the New Philharmonic Concert last Saturday afternoon. We confess that we went to hear her with no ordinary expectations. Not only had the German musical newspapers for some time past been unanimous in her praise, but it was reported that no less an authority than Dr. Bilow considered her the greatest female pianist in Europe. An artist who comes to this country preceded by such a reputation as this has a severe ordeal to undergo in making a first appearance, especially before audiences with whom the impression of such masterly playing as that of Dr. Bilow is still fresh. Under such circumstances to have not only equalled but surpassed the highest anticipations formed concerning her is indeed a triumph; and such, we can honestly say, was the result of our first hearing of Mdme. Essipoff.

This young lady comes from St. Petersburg, and is a pupil, and also the second wife, of the well-known and esteemed pianist Leschetitzky.

She chose for her first appearance before an English public Chopin's concerto in E minor, and solos by Mendelssohn, Liszt, and Rubinstein. Long before the end of the first movement of the concerto the pianist's success was a certainty. It is indeed difficult to speak of her playing exactly as we feel about it, without appearing extravagant. To a beautiful touch she unites an absolutely faultless technique, which is fully equal to all the demands of the modern school of bravura; her accuracy is so unimpeachable that during the whole afternoon we did not detect one wrong note in the most difficult passages; in gradations of tone she unites a masculine power with feminine delicacy; her *cantabile* playing is charming, and her phrasing and rhythm are perfect. And to this catalogue of excellencies there still remains one more, and the highest of all—soul. Mme. Essipoff is no merely mechanical player. With her, technique is simply the means, not the end; and the expression and "reading" both of the concerto and of the smaller solo pieces were so perfectly satisfactory, just because they were evidently so perfectly natural—full of warmth and feeling, yet without the slightest trace of exaggeration. Madame Essipoff may unhesitatingly be ranked among the very first living performers on her instrument. The applause with which she was rewarded was as well deserved as it was liberally bestowed.

A few words must suffice for the remainder of the concert. Mr. J. F. Barnett's clever overture to *A Winter's Tale* was the opening, and the overture to *Le Domino Noir* the concluding number. A novelty was brought forward in Gottfried Linder's introduction to "Roswitha," a cleverly-scored but not very interesting piece; and a performance was given of Beethoven's symphony in A, which we must honestly say was the coarsest and most unsatisfactory to which we ever had the misfortune to listen. Madame Regan-Schimon, the only vocalist of the afternoon, sang the "Dove sono" from *Figaro*, "Va, dit-elle" from *Robert le Diable*, and two songs by Schubert (accompanied on the piano by Herr Ganz) with much taste. EBENEZER PROUT.

THE grand concerts given in honour of the Czar at the Crystal Palace last Saturday, and at the Albert Hall last Monday, being chiefly of the character of State pageants, require no detailed notice in our chronicle of musical events. At the former the great feature was the singing of the London contingent of the Handel Festival Choir, some 2,500 strong, supported by a full orchestra and eleven military bands; while the Albert Hall Concert relied for its attraction upon Mr. Barnby's excellent choir, and such well-known vocalists as Mdle. Titiena, Mme. Patey, Mr. Cummings, and Signor Foli.

AT the last Philharmonic Concert, on Monday evening, a new violinist, Senor Sarasate, made his first appearance in this country. He brought forward a new concerto for his instrument, dedicated to him (and therefore presumably written for him) by Edouard Lalo, a living French composer, a technically clever, but on the whole very tedious and uninteresting work. We should prefer to hear Senor Sarasate in some better music before pronouncing a decided opinion with respect to him, but meanwhile may say that his tone is exceedingly pure and of fine quality, his intonation very accurate, and his command of technical difficulties apparently complete. The remainder of the programme included the G minor symphony of Mozart, Beethoven's No. 8 in F, the overtures to *Meerestille* and *Lodoika*, and vocal music by Mr. Santley and Herr Gustav Walter, from Vienna. The last-named gentleman, in the air "Constanze" from Mozart's *Seraglio*, showed himself not only the possessor of a fine voice, but a trained and accomplished artist.

HERR ERNST PAUER's three interesting Historical Performances of Pianoforte Music at Hanover Square Rooms came to a close last Monday. The

excellent pianist's research and versatility were alike shown in the programmes, which comprised specimens of Scarlatti, Sebastian Bach, Emanuel Bach, Couperin, Rameau, Handel, Haydn, Clementi, Mozart, Dussek, Hummel, Field, Beethoven, Schubert, Weber, Mendelssohn, Schumann, Chopin, Heller, Thalberg, and Liszt.

BACH's "Magnificat" was performed for the first time in England on Tuesday evening last by the Borough of Hackney Choral Association, conducted by Mr. Richard Payne, at the Assembly Rooms, Stoke Newington.

THIS afternoon's concert at the Crystal Palace will consist exclusively of French music, and will include among other interesting numbers a selection from Berlioz's much-talked of but seldom heard symphony "Romeo and Juliet."

THE *Signale* says that Madame Adelina Patti has concluded an engagement with the Comic Opera at Vienna for next season.

NEWS comes from Bayreuth that Wagner's undertaking has made another decided step forward. In consequence of further assistance received from the King of Bavaria, funds are now available for the complete stage decorations, scenery, costumes, &c. The scenery will be from designs by the painter J. Hoffmann, but, by his own wish, will be painted, not by himself, but with his co-operation by the court scene-painters of Coburg, the brothers Brückner. The necessary contracts have been already concluded; as also have those for the preparation of the machinery with the machinist Brandt in Darmstadt, and for the completion of the house itself with the architect Brückwald from Leipzig. The costumes will be prepared from drawings by J. Hoffmann.

THE musical critics of Augsburg report that the last winter has been exceptionally rich in the production of new pieces, and in the number and excellence of the concerts that have been held in the old imperial city. Handel's *Alexander's Feast* was revived in the early part of the season, but it did not meet with the admiration among the younger part of the audience that had been anticipated, and it seems undeniable that the more recent composers are held in higher esteem in Germany generally than the older classical composers. At Augsburg, at all events, the rising generation apparently listens with most satisfaction to Beethoven, Spohr, and Mozart.

THE annual meeting of the German St. Cecilia Society, the principal aim of which is the cultivation of classical church music, will this year be held at Ratisbon, on August 3 to 5. The programme announces ten performances of this sacred music, seven of which will be held in the churches in connexion with the ordinary services of the day. The magistrates of Ratisbon have placed the townhall at the disposition of the society for its public meetings, and the directors of the Bavarian railways announce that return tickets available for a week will be issued for the benefit of strangers wishing to attend the festival.

A NATIONAL Society of Music has been formed in France with the view of producing the works of unknown, or but little known composers. The musical composer labours under great difficulties in making his work known to the public. He must find in many cases a theatre, an orchestra, singers, and musicians before his creation can assume a definite form, and these can only be gained by a great expenditure—a consideration that often prevents the production of real works of genius. The National Society of Music undertakes the carrying out of the composer's ideas, so that the public may be able to judge of his talent, which, in the present state of things, is often ignored because he has no means of displaying it. It has a concert-room, an orchestra and singers, and announces concerts of entirely new music.

GLÜCK's *Iphigenia auf Tauris* is being acted with great success at the Royal Theatre of Copenhagen.

POSTSCRIPT.

A CORRESPONDENT points out that the "unpublished" letter of Keats given to the world by the *Athenaeum* last week, is to be found *verbatim* in the present Lord Houghton's *Life, Letters, and Literary Remains of John Keats*, vol. i. p. 87, ed. of 1848.

THE Annual Report of the Trustees of the National Portrait Gallery was published on Thursday. From it we learn that twelve donations have been received during the past year; these include—a marble bust, by Mr. Joseph Durham, of Sir George Pollock; Stewardson's portrait of George Grote, painted in 1824; Sir Wm. Beechey's portrait of the Right Hon. Geo. Rose; Sir Harbottle Grimston, by Sir Peter Lely; a small profile, sketched in lead pencil upon paper, by Joseph Bonomi, in 1857, of David Livingstone; also portraits of Thomas, first Lord Denman, Charles, third Earl Stanhope, Sir Chas. Hanbury Williams, Henry Vassall Fox, third Lord Holland, &c., &c. The purchases include Sir Peter Lely's portraits of James Butler, first Duke of Ormond (price 42*l.*), and Thomas Butler, Earl of Ossory, his son (also price 42*l.*), Sir Joshua Reynolds's portrait of Sir William Blackstone (price 157*l.* 10*s.*). Other additions by purchase are paintings of James II.; George II., and his consort, Caroline of Anspach, in coronation robes; Lord Campbell; John Philpot Curran; Charles Edward Stuart (Count of Albany), and Louise his wife, by Pompeo Batoni; and a small crayon drawing of Henry Stuart, Cardinal of York.

We note also "a half-length figure, with venerable white beard, wearing a plain yellow garment, and holding a stick in his hand" said to be "Old" Thomas Parr; and a painting "in the school of Sir Peter Lely" of Barbara Villiers, Duchess of Cleveland. The trustees also acknowledge further donations of autograph letters, written by persons whose portraits are already in the Gallery: these comprise letters from Sir M. I. Brunel, W. S. Lander, Elizabeth Barrett, Lord Byron, T. Campbell, James Ward, Coleridge, J. Wilson Croker, C. J. Fox, Sir D. Wilkie, Sir Godfrey Kneller, Queen Anne, Robert Harley Earl of Oxford, and Lord Holland. Of George Grote, in addition to a characteristic letter, are several specimen pages of his Greek and philosophical writings. The number of visitors to the Gallery last year was 60,047.

THE Venus of Milo seems to afford a perennial source of fond occupation to some people; among them, M. Claudius Tarral, of Paris, who has all along maintained that she must have originally stood resting on one of the Terms brought with her from Milo, and as he with some others believes found with her. In this spirit he made a restoration of the statue, which he vindicates by certain other figures of Venus in this attitude, of which also a new example was found last year at Pompei. A photograph of the Pompeian statuette obtained by him has just been communicated to the Académie des Inscriptions, by M. Ravaisson, of the Louvre, who, however, being pledged to a different interpretation of the original attitude of the Venus, produced at the same time photographs of an unpublished marble group in the Villa Borghese, at Rome, in which Venus is represented, as he considers the goddess from Milo to have been, with Mars standing on her left, and—but that does not appear to disturb his comparison—Cupid on the right. M. Ravaisson took the opportunity of announcing that he would shortly lay before the Académie authentic unpublished documents relative to the discovery of the statue in Milo, a promise which cannot be too soon fulfilled. Meantime, for those who desire to see the hopeless conflict of opinion, not to say evidence, which at present surrounds the Venus, we would recommend the newly published memoir of Professor Preuner, of Greifswald, *über die Venus von Milo*.

THE

ACADEMY

A WEEKLY REVIEW OF

LITERATURE, SCIENCE, ART, MUSIC, AND THE STAGE.

Will contain:

REVIEWS and NOTICES of all important New Books, English and Foreign.

REPORTS of TRAVEL, EXPLORING EXPEDITIONS, &c.

ENGLISH LANGUAGE, ANTIQUITIES and FOLKLORE.

NEWS LETTERS from Foreign Countries.

CORRESPONDENCE between Literary Men.

PUBLISHERS' ANNOUNCEMENTS.

NOTES on the PROGRESS of SCIENTIFIC DISCOVERY in all branches.

CRITICISMS of the PICTURE GALLERIES, of the STAGE, and of MUSIC.

OPINIONS OF THE PRESS.

"The ACADEMY may fairly claim the first place among literary journals as the representative of the ripest and soundest English scholarship; and its criticisms of art, literature, music, and the drama are informing, incisive, and trustworthy. . . . It is hardly possible in a few words to give an idea of the excellence of this old journal in its new form, but every subject with which it deals (and it deals with many untouched by other papers) is entrusted to the hands of men who know what they are writing about, and the result is a freshness and fulness of information and an accuracy of judgment which commands confidence, and ministers to the intellectual satisfaction and pleasure of the reader. . . . The accomplished and scholarly dramatic critic of the ACADEMY, Mr. Frederick Wedmore, the novelist, whose theatrical notices are perhaps the best in style and the most trustworthy now appearing in any London journal."—*Manchester City News*.

"Our contemporary the ACADEMY has suddenly sprung into a great literary position, and is full of instructive and interesting matter."—*Spectator*.

"The ACADEMY, in its new and enlarged form, has a promising look. Its size is that of the *Athenaeum*, and the general arrangement of its contents does not differ much from that of its venerable and not too enterprising contemporary. The great distinction between the two is that the articles of the ACADEMY are signed. . . . It will be seen that there is no lack of strong names. But strong names will not of themselves float a new paper. The editing, the general tone, the make-up of it are more important, and of these too a good report can be given. . . . Altogether, the ACADEMY is very readable, and bids fair to be a formidable rival to the *Athenaeum*, which, for that matter, it might speedily and easily surpass in certain respects."—*New York Tribune*.

"We can confidently recommend the ACADEMY to our readers. Its price is fourpence, and all its papers and reviews are signed by their writers, whose names have a high position in literature and art."—*London Figaro*.

THE ACADEMY will pursue the purely practical aim of being a guide and source of information to all educated persons.

PUBLISHED BY

WM. GREIG SMITH, 43 Wellington Street, Strand.

NEW WORKS.

The SECOND EDITION of the EDINBURGH REVIEW for APRIL.

CONTENTS:—

1. EASTERN TOORISTAN.
2. COMPETITIVE EXAMINATIONS.
3. PRINCE BISMARCK and the CHURCH of ROME.

A LATIN-ENGLISH DICTIONARY adapted for the use of Middle-Class Schools. By JOHN T. WHITE, D.D. Oxon. Square fcap. 8vo, 3s. [On Friday next.]

Epochs of History.

The ERA of the PROTESTANT REVOLUTION. By F. SEEBOM, Author of "The Oxford Reformers—Colet, Erasmus, More." With Four Maps. Fcap. 8vo, price 2s. 6d. [On June 1.]

Text-Books of Science.

PRINCIPLES of MECHANICS. By T. M. GOODEVE, M.A., Barrister-at-Law, Lecturer on Applied Mechanics at the Royal School of Mines. Small 8vo, with 208 Woodcuts, 3s. 6d.

London: LONGMANS & CO.

JOURNAL of HENRY COCKBURN;

Nearly ready, 2 vols. demy 8vo, price 21s.

Being a Continuation of

MEMORIALS of HIS TIME, 1831—1854.

"It would be impossible to get too much of Henry Cockburn. It is to be dreaded we have now got all that he has left us. The result is a work which, if specially delightful as a contribution to Scotch history, is also an important, though in some respects special or detached, addition to English literature."—*Scotsman*.

"THE MOST INTERESTING and THE MOST PHILOSOPHICAL HISTORY THAT HAS BEEN WRITTEN of ENGLISH LITERATURE."—*Globe*.

THE STANDARD EDITION.

THE HISTORY of ENGLISH LITERATURE.

By H. TAINE, D.C.L.

Translated by HENRY VAN LAUN.

New and carefully Revised Edition.

In 4 vols. small demy 8vo, price 7s. 6d. each.

"Will take its place in the very foremost rank of works on the literature of England."—*Spectator*.

"Deserves a conspicuous place in every library filled with the immortal works of which it narrates the history."—*Daily News*.

"An excellent text-book for the use of students; very much superior to any of those now in use at our schools and colleges."—*Examiner*.

In preparation, 1 vol. crown 8vo.

WORDSWORTH'S TOUR in SCOTLAND IN 1803,

In COMPANY with his SISTER and S. T. COLERIDGE; Being the JOURNAL of Miss WORDSWORTH, now for the first time made public.

Edited by Principal SHAIRP, LL.D.

"If there were no other record of her than those brief extracts from her Journal during the Highland Tour, which stand at the head of several of her brother's poems, these alone would prove her possessed of a large portion of his genius. Larger extracts from them occur in the poet's biography and in the edition of the Poems of 1837, and often they seem nearly as good as the poems they introduce. Might not that wonderful Journal even yet be given entire, or nearly so, to the world?"—*North British Review*.

Second Edition, fcap. 8vo, price 6s.

STUDIES in POETRY and PHILOSOPHY.

WORDSWORTH.

COLERIDGE.

KEBLE.

The MORAL MOTIVE POWER.

By J. C. SHAIRP,

Principal of the United College of St. Salvador and St. Leonard, St. Andrews.

Fourth Edition, fcap. 8vo, price 3s. 6d.

CULTURE and RELIGION.

By J. C. SHAIRP,

Principal of the United College of St. Salvador and St. Leonard, St. Andrews.

"A wise book, and, unlike a great many other wise books, has that carefully shaded thought and expression which fits Professor Shairp to speak for Culture no less than for Religion."—*Spectator*.

This day, crown 8vo, price 7s. 6d.

THE LATE REV. JOHN DUNCAN, LL.D.

IN THE PULPIT AND AT THE COMMUNION TABLE.

With a Biographical Supplement.

Edited by DAVID BROWN, D.D., Author of "The Life of John Duncan, D.D."

Third Edition, fcap. 8vo, price 3s. 6d.

DEEP-SEA SOUNDINGS.

Colloquia Peripatetica.

By the late JOHN DUNCAN, LL.D.

Professor of Hebrew in New College, Edinburgh;

Being Conversations in Philosophy, Theology, and Religion.

Edited by Rev. W. KNIGHT.

1 vol. fcap. 8vo, price 7s. 6d.

BUSINESS.

By A. MERCHANT.

"This little book, if it is not unfair to suggest such a comparison, belongs to the same class as Burton's 'Anatomy of Melancholy.'"

"This remarkable book."—*Manchester Examiner*.

Fourth Edition, price 2s. 6d. post free.

ON SELF-CULTURE:

INTELLECTUAL, PHYSICAL, and MORAL.

A Vade-Mecum for Young Men and Students.

By JOHN STUART BLACKIE,

Professor of Greek in the University of Edinburgh.

"An adequate guide to a generous, eager, sensible life."—*Academy*.

"Every parent should put it into the hands of his son."—*Scotsman*.

EDMONSTON & DOUGLAS, 88 Princes Street, Edinburgh.

TRÜBNER & CO.'S NEW PUBLICATIONS.

NOTICE.—The SECOND EDITION of Mr. GEORGE HENRY LEWES'S PROBLEMS of LIFE and MIND. First Series, "The Foundations of a Creed." Vol. I. is now ready at all Booksellers and Libraries.

THE CREED of CHRISTENDOM: Its Foundations contrasted with its Superstructure. By W. R. GREG. Third Edition: With a New Introduction. Two Vols., crown 8vo, pp. 272 and 290, cloth, 18s.

ENIGMAS of LIFE. By W. R. GREG. Sixth Edition. Crown 8vo, pp. xxi+308, cloth, 10s. 6d.

THE DEVELOPMENT of CREATION on the EARTH. By T. L. STRANGE. Demy 8vo. [Nearly ready.]

THE LEGENDS of the OLD TESTAMENT Traced to their Primitive Sources. By T. L. STRANGE. Demy 8vo. [Nearly ready.]

THE UNITY of CREATION. A Contribution to the Solution of the Religious Question. By F. K. KINGSTON. Crown 8vo, pp. 160, cloth, 5s.

SPANISH REFORMERS of TWO CENTURIES, from 1520, their Lives and Writings, according to the late B. B. Whiffen's Plan, and with the use of his Materials. Described by E. BOEHMER, D.D., Ph.D. Vol. I. with Narrative of the Incidents attendant upon the Republication of "Reformistas Antiguos Españoles," and a Memoir of B. B. Whiffen, by Isaline Whiffen. Roy. 8vo, pp. 232, cloth, 12s. 6d.

HENRY BEYLE (otherwise De Stendahl). A Critical and Biographical Study, aided by Original Documents and Unpublished Letters from the Private Papers of the Family of Beyle. By ANDREW ARCHIBALD PATON. Crown 8vo. [Immediately.]

"A book which is sure to be widely read."—*Standard*.

THREADING MY WAY: Twenty-Seven Years of Autobiography. By ROBERT DALE OWEN. Crown 8vo, pp. 344, cloth, 7s. 6d.

"A very pleasant little book."—*Saturday Review*.

ANNUAL REPORT of SCIENCE and INDUSTRY for 1873. Edited by SPENCER F. BAIRD, with the assistance of Eminent Men of Science. Demy 8vo, pp. 848, cloth, 9s.

THE ENGLISH GIPSIES and their LANGUAGE. By CHARLES G. LELAND. Second Edition. Crown 8vo, pp. 276, cloth, 7s. 6d.

A PERSIAN-ENGLISH and ENGLISH-PERSIAN DICTIONARY. By E. H. PALMER, M.A., Professor of Arabic at the University of Cambridge. [In the press.]

THE DATHAVANSO; or, the History of the Tooth Relic of GOTAMA BUDDHA in Pali Verse. Edited, with an English Translation, by MUTU COOMARA SWAMY, F.R.A.S. Demy 8vo. [Immediately.]

SUTTA NIPATA; or, the Dialogues and Discourses of GOTAMA BUDDHA (2,500 years old). Translated from the original Pali, with Notes and Introduction, by MUTU COOMARA SWAMY, F.R.A.S. Crown 8vo. [Shortly.]

THE CHINESE CLASSICS. Translated into English. With Preliminary Essays and Explanatory Notes. By JAMES LEGGE, D.D., LL.D. Vol. II. The Life and Works of Mencius. [In the press.]

THE RAMAYAN of VALMIKI. Translated into English Verse by RALPH T. H. GRIFFITH, M.A., Principal of Benares College. Vol. IV. Demy 8vo, pp. 440, cloth 18s.

Copies of Vols. I. and II. are still to be had at 18s. each, also Vol. III. at 15s.

HISTORY of INDIA, Hindu, Buddhist, and Brahmanical. Forming the Third Volume of the "History of India from the Earliest Ages." By J. TALBOYS WHEELER. Demy 8vo, with Maps illustrating the Aryan Conquest, the Invasion of Alexander the Great, the Empire of Magadha, &c. [In the press.]

A COMPARATIVE GRAMMAR of the DRAVIDIAN, or SOUTHERN INDIAN FAMILY of LANGUAGES. By the Rev. R. CALDWELL, LL.D. A Second, Corrected, and Enlarged Edition. [In preparation.]

WATER ANALYSIS. A Practical Treatise on the Examination of Potable Water. By J. A. WANKLYN, M.R.C.S., and E. T. CHAPMAN. Third Edition, Revised and Enlarged by J. A. WANKLYN, M.R.C.S. Crown 8vo, cloth, 5s. [Immediately.]

TEA, COFFEE, and COCOA. A Practical Treatise on the Examination of Tea, Coffee, and Cocoa. By J. A. WANKLYN, M.R.C.S. Crown 8vo. [In the press.]

ON BEER. A Statistical Sketch. By M. VOGEL. Fcap. 8vo, pp. 88, cloth limp, 2s.

London: TRÜBNER & Co., 57 and 59 Ludgate Hill.

Printed by SPOTTISWOODE & CO., New-street Square, and Published by WILLIAM GREIG SMITH, 43 Wellington Street, Strand, London.—Saturday, May 23, 1874.

Agents: for Manchester, J. HEYWOOD; for Edinburgh, J. MENZIES.

SATURDAY, MAY 30, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The History of Japan, from the Earliest Period to the Present Time. Vol. I., to the year 1864. By P. O. Adams, formerly H.B.M.'s Chargé d'Affaires and Secretary of Legation at Yédo. (London: Henry S. King & Co., 1874.)

The Legacy of Jeyas, deified as Gongen Sama. A posthumous Manuscript in one hundred Chapters. Translated from three collated copies of the Original by John Frederick Lowder, Barrister-at-Law, Legal Adviser to the Board of Revenue and the Customs in Japan. Printed at the *Japan Daily Herald* Office. (London: Trübner & Co., 1874.)

It is not an easy task to write a popular History of Japan; or any history of that far Eastern land and its people that shall possess attractions for a large circle of English readers. Not that there is any lack of stirring incident and all the elements of interest which make the charm of other histories, but simply because the people themselves are so alien—in race and type, and until very recently so disconnected with everything European, that they are outside the range of our sympathies, which are apt to be somewhat circumscribed in their scope, and limited to interests of a domestic nature. The constant recurrence of names in trisyllabic combination, and with uncouth and unfamiliar sounds, tends to still more diminish interest by destroying all individuality in the personages. From want of association with any known forms it is difficult to remember them through half-a-dozen pages, and to identify them as they recur. Kiyomosi, the son of Taira no Tadamosi, or Go-Shirakawa; Sutoku—Rokiyô and Takakura, and the like, are trying to the memory.

In the condensed form adopted by Mr. Adams for the past history of Japan, constituting Book i., and not extending over one hundred pages, it is easy to see that he was not unconscious of this difficulty. Many of his readers will rejoice that a general idea of what Japan was in ancient times, and continued to be, with little variation, under theocratic and feudal principles of government down to the present century, has been conveyed within so small a compass. The signature of treaties, forcing intercourse and commerce with Western nations upon the Japanese, introduced a totally new element into their existence, and the result has been very much what they anticipated and feared—a revolution, in the midst of which they are now somewhat wildly struggling to give form and substance to a new phase of national life. How far they will succeed in this doubtful enterprise, so suddenly forced upon them by foreign intervention—and what are the conditions under which the task has to be accomplished, are questions of great interest. But they are questions which

cannot be discussed without some previous acquaintance with their history and the various stages of national progress and development through which they have passed. Mr. Adams has rightly chosen, therefore, to begin at the beginning; and, although it may be extremely difficult within the limits of a short article to give even an outline of the events and leading incidents which have mainly determined the course of Japanese history, something in this direction is essential if we desire to form any intelligent estimate either of the present position or the future prospects of Japan. The durability of the great transmutations and changes, all crowded into the short space of six years, must greatly depend upon the fitness of the schemes devised for the improvement and enlightenment of the people. These, whatever their value, have all come from above—from a very few leaders who have suddenly stepped to the front from comparative obscurity, and isolated positions singularly inimical to any breadth of view or political knowledge and experience. Neither the people, nor the great body of the educated and ruling classes can have had any voice, consultative or otherwise, in determining the nature or extent of such changes. Many of these—most of them, indeed—have been taken from foreign models, with which none but the most superficial and imperfect acquaintance could have been obtained. With the leading spirits of this great national movement, it has been very much as with Prince Florestan of Monaco, “who looked upon Government as a question of his own ideas, and not of the people's wants and wishes.” Revolutions so effected in the West do not generally found anything very permanent. Is there any better hope for an Asiatic people so differently constituted and governed? The question is all the more interesting from the novelty of the conditions under which the experiment is being made; perhaps, because there are not wanting theorists and politicians among ourselves (from whom the ill-starred Prince just cited appears to have taken his inspirations) who would, if they could, force upon a reluctant people blessings which they do not desire, but which their respective benefactors think they ought to possess. Certainly, as regards the Japanese, it must be admitted by all who have ever known them, that a people more willing to go on in the beaten track of their ancestors, or less disposed to welcome innovation from a foreign source, could scarcely have been found over the whole breadth of Asia. Nevertheless, as the result shows, men of Japanese race have thought otherwise, and boldly initiated a succession of changes in the political and social organisation of the country, which they no doubt hope to graft upon the old stock of native growth, and permanently establish in the country, however foreign may be the character of the fruit that is to follow. Apart from the psychological and social aspects of the questions involved in the present experiences of the Japanese, they have strong claim upon the sympathy and interest of all the Western Powers. These and their subjects together, for their own ends, have brought this vertigo of political

excitement and change upon a nation altogether unprepared for such a perilous undertaking. Mr. Adams believes the country was ripe for great political changes and a revolution from internal causes, quite independent of any foreign influences. I think this more than questionable. There would seem to be nothing in the past history of Japan to lead to the conclusion that the causes of discontent among the Daimios or their feudatories and retainers, against the Tycoon, arising from old standing grievances connected with the galling and oppressive nature of the restrictions maintained in his interest, would have led to anything more than a change in the person or the dynasty of reigning Tycoons, as at previous epochs. At most, some modification or new adjustment of the relations subsisting between the Tycoon, on the one hand, and the great feudal chiefs on the other, to the advantage of the latter, as the sole depositories of a ruling power, was all that could be anticipated. But the new relations entered into by the Tycoon with foreign states, and the introduction of foreigners into the country, brought a new element into the chronic discord. That these relations had been imposed upon the Shogun, quite as much against his will as theirs, was no palliation. On the contrary, the sense of national humiliation which attended the signature of the first treaty with the United States—under the guns of American frigates, and no sparing use of “moral force”—only widened the breach and intensified their discontent. Some of the Daimios had even counselled resistance, and visited upon the head of the Tycoon all the disgrace of submitting to dictation. But for this heaven imported from abroad, which soon permeated the whole mass with a fermenting action, the restoration of the Mikado and the self-effacement of the Daimios, as actual holders of large revenues, and still greater feudal privileges and power,—the abolition of the Shogun's office and the deposition and exile of its last holder, could never have entered into the plans, either of the Daimios or their advisers and retainers. All their history through the last ten centuries negatives such a supposition. Nor, if it were possible to conceive that changes of this sweeping and novel character could have been the spontaneous product of Japanese left to their own traditions and modes of thought, can it for a moment be believed that a revolution from native causes would have taken the form of a thoroughly denationalising process, had there not been close contact with such foreign influences as were best calculated to prepare the way and lead to this end. It is, I think manifest, that what the Japanese are now attempting, must be held to be, in its inception and execution alike, of foreign origin—guided by foreign hands and influences,—and not the outcome of any natural growth or spontaneous process of development. If we would know what ideas have really governed the action of these rapidly developed innovators, we must look to a native work of great repute, the *Nihon Giashi*, largely quoted by Mr. Adams, from translations furnished by Mr. Satow, “as the chief source from which most Japanese of education derive their notions

of the history of their own country." Then if we take up the more recent utterances of the Japanese students sent to Europe and the United States for education, of which we have some very instructive specimens in a work published by Messrs. Longman in 1872, entitled the *Japanese in America*, we shall see how Western culture and civilisation furnished the exotic ideas, which were by a natural effort grafted on the ancient Japanese faith, traditions and principles. The result so far has been a kind of hybrid now coming into existence in Japan, under the auspices of Iwakura, and other active spirits, who have spent some time in Europe and America preparing themselves for this work. The importance of knowing something of what may be regarded as the primary rock in these successive strata of faith and traditions is obvious, for on that foundation, with singularly little modification, their whole system of philosophy and government has been built up to the present day. Japanese tradition traces the present Emperor in an unbroken line from a certain Divinity. Such a line, as Mr. Adams observes, "has not been difficult to preserve in a country where the principle of adoption exists on the widest basis, and where the son of a concubine can legitimately succeed to his father's inheritance." The influence of an unfailing faith in such a descent cannot be over-estimated in considering either the causes of limited progress and comparative immobility of the nation, or the steadying power observable during the whole of the recent sudden outbreak of political passions and a spirit of innovation, with scarce a trace throughout the whole of any drifting towards democracy or republicanism. If we trace back the origin of the form of government, in many respects peculiar to the Japanese, and distinguished from all others in history by its transmission, unchanged in essential features, through more than twenty centuries, we may see that its theocratic type owes its stability and enduring power to this traditional descent by an uninterrupted line from the Sun goddess. The Divine right of kings was long a saving tradition in the West, which served as a tower of defence against all subversive theories. But this has long failed the monarchs of western countries, while this principle of hereditary right derived from divine descent still stands erect in Japan amidst a chaos of dissolving institutions and many foreign influences of a levelling tendency. On this original foundation of theocratic and monarchic rule, feudalism arose, and subsequently the domination of a military caste—a domination which eventually became so real, that the actual holder of the sceptre became but a phantom monarch, a cloistered recluse, and a puppet in the hands of the ablest feudal magnates or the most successful soldier of the military caste. Noble or general, it mattered little. Like the last of the Merovingian dynasty in France under successive mayors of the palace, their days were passed in idle insignificance and seclusion from the world or its actual duties. In this we have the key to all Japanese history. Intermittent

struggles among the Imperial scions for the governing Power, and sometimes among more ignoble adventurers backed by military success, mark the various epochs. Originally vested in a divinely descended Mikado, all power, spiritual and temporal, was concentrated in his person. The temporal and executive functions were first delegated, in times of trouble and civil war, to kinsmen of the blood for the purpose of restoring order amongst a turbulent class of feudal princes and chiefs of clans, and then usurped and made hereditary. Still, as Mr. Adams rightly observes,

"it must never be forgotten by the student of Japanese history that there was a prestige in the Imperial person which nothing ever did or ever could abolish. No one permitted himself to doubt his Majesty's descent in an unbroken line from the gods who created and ruled over Japan; he was, as already mentioned, the fountain whence all rank and office flowed. The shōgun, or general, owed his appointment to the Emperor; without a commission from the latter all his acts would be wanting in legality; and, even though he possessed the whole military power in the State, he found himself, when at Court, not even the first of his Majesty's subjects; nor could he, by reason of his office alone, claim the right of gazing on the imperial countenance. Hence it was that, in their wars with each other, the great military commanders were constantly endeavouring to secure the person of the sovereign, so as to clothe their acts with legality, and to make out that their side was the loyal side, and that their adversaries were *chōteki*, or rebels of the Court."

A system, however, had grown very early of constantly changing the Emperor and of conferring the Imperial dignity on mere children. This naturally gave the whole power into the hands of others. Their annals show how constantly the phantom sceptre was in the hands of infants—sometimes of women—but rarely in the grasp of those who could wield the real power. That a race of mayors of the palace should spring up under such a régime was the most natural thing.

In the twelfth century the most celebrated of these, Yoritomo, after a long contest and a series of hair-breadth escapes, succeeded, by valour and crafty statesmanship combined, in establishing undisputed power, and he virtually ruled the Empire. But, as a Japanese historian remarks in a very characteristic vein, "he never ventured to overstep the proper limit, and his acts were full of reverence for the Sovereign!" In this sketch we have a résumé of all that followed from the twelfth to the nineteenth century. "The Imperial House itself cast away the authority, and was unable to recover it. Whoever seized the reins became the administrator and ruler *de facto* of the Empire." He did not attempt to depose the Emperor, as we have seen, or to assume His Majesty's titles, but he administered the Empire as seemed good to him, in the name and with the authority of the *fainéant de jure* Sovereign at Kioto, whose sanction, never refused, clothed his acts with legality, and gave to his own position a stability and authority it never could have obtained if the usurpation had involved the deposition of the Mikado. In this we see the contrast between the history of France and Japan in nearly similar circumstances. A successful general, with a Pope

claiming Divine authority to bind and to loose, could supplant the descendant of a line of kings, and reign as securely and absolutely as an hereditary monarch. Not so the Shogun. The Mikado combined in his own person all powers spiritual and temporal of Pope and King, and without his sanction and consent no one could reign. It is easy to understand, therefore, how in the sixteenth century, when Japan became first known to Europeans, and missionaries from Rome began to make converts, the astute occupant of the Shogun's office—Taikō Sama—was not slow to perceive that there were pretensions of temporal as well as spiritual rule put forth by these pioneers of a new religion, perfectly incompatible with the Mikado's supremacy and his own authority, emanating from that source alone. The expulsion of all who taught such a religion—Jesuit, Franciscan, and Dominican—and the extermination of their converts, was only a question of time and convenience. It was inevitable, and the century occupied in the series of missionary successes and checks which ended in final expulsion, with the destruction of all their churches and monasteries, forms a tragic and instructive episode in the history of Japan.

The successor to Taikō Sama reaped the fruit of this vigorous policy in an uncontested rule. This brings us to the accession of *Iyēyasu*, the most glorious and revered of all the Shoguns, and the founder of the dynasty of *Tokugawa*, which only terminated within the last six years by the deposition of *Stōbashi* in the late revolution, after flourishing 265 years and giving fifteen Shoguns. He it was who, in A.D. 1603, after a crowning victory, was made by a grateful sovereign, *Sei-i-tai-Shogun*, and wrote the celebrated "Legacy" of which Mr. Lowder has just given a translation. This testamentary Legacy occupies the same place in Japanese history that the less authentic will of Peter the Great does in Russia. Both rulers had the same object, namely, to shape the policy of all their descendants for the aggrandisement of the Empire and the transmission of power in the direct line of inheritance. This little work is of the highest value, as giving a clear insight into the policy and maxims of government, of one of the ablest and most distinguished Rulers Japan has ever had; written at a time when by his personal influence he could not only establish a whole code of laws under his own supervision, but make these and the principles and maxims on which they were founded the governing ideas of succeeding generations of Japanese. Whoever would understand under what influences Japan has been governed during the last three centuries, and the Japanese mind moulded into its present form, should make this little book his study. Nowhere else in so small a compass can the same means of enlightenment and instruction be obtained.

Of the progress made, and the sweeping changes effected in this long established order of things within the last few years, it is impossible here to give any detailed account. Although the greater part of Mr. Adams's book is occupied with these, he has only carried us as far as the year 1865—the

period immediately preceding the deposition of the last of the Shoguns, and the beginning of a civil war. It is only an instalment, therefore, and as he proposes to give the remainder in a second volume, its appearance will give a better opportunity of passing in review the whole subject and showing the evolution of events in their true order and connexion. Mr. Adams has executed his task, as far as it has gone, with great care, and the only fear is, that to those not previously interested in Japan or the far East, there may be too much of detail, and too many extracts from Blue-books and despatches, which are not usually very attractive to a general reader. It is matter of congratulation, nevertheless, that members of the diplomatic and consular services in Japan should devote what leisure they can command from sufficiently arduous duties to collect and carefully sift information on all that can throw any light on the history and progress of the country in which they are resident. There is yet a great deal to be known of Japan; and the members of the different legations and consulates are much more favourably placed than any other class to obtain the best information. Nor can they possibly do a greater public service than by placing before their governments and the world trustworthy data on which a correct judgment may be formed of the modes of thought and principles of action which govern both rulers and people. Such information is only to be obtained by careful observation and patient study among the people.

RUTHERFORD ALCOCK.

The Poetical Works of Gavin Douglas, Bishop of Dunkeld. With Memoir, Notes, and Glossary. By John Small, M.A., F.S.A. Scot. In Four Volumes, crown 8vo. (Edinburgh: Paterson, 1874.)

THERE is something almost pathetic in the late date of this first collective and adequate edition of so notable a Worthy as Gavin Douglas, Roman Catholic Bishop of Dunkeld. For fully three centuries and a half this fine-brained and nightingale-throated Singer has waited for this service. Hitherto he has been presented fragmentarily, and, on the whole, perfunctorily. Thomas Ruddiman—to whom Mr. Small pays a deserved tribute for "the large Glossary explaining the difficult words and serving for a dictionary to the old Scottish language"—reprinted the so-called first edition of the translation of the *Aeneid* of 1553; but notwithstanding his partial use of the Ruthven MS. in the University of Edinburgh, it swarms with errors and misprints. In 1839, George Dundas, Esq., afterwards Lord Manor, and Andrew Rutherford, afterwards Lord Rutherford, presented the Bannatyne Club with a typographically splendid and valuable reproduction of the Gale MS. of the *Aeneid* in Trinity College Library, Cambridge. Earlier (in 1827) J. G. Kinnear, Esq., through the same club, gave a fac-simile reprint of the Edinburgh 1579 edition of the "Palace of Honour." In 1786, John Pinkerton included "King Hart" in his *Ancient Scottish Poems, never before in print; but now published from the MS. Collections of Sir Richard Maitland of Lethington* . . . (2 vols. sm. 8vo). From 1806 to

1816, Sylvester Douglas, Lord Glenbervie, mandered over a projected complete edition. He had few or no qualifications for the task, so that it is fortunate his intention proved abortive. At last a competent and sympathetic editor has been found, and, with every abatement, his is a piece of sound and honest work.

The bibliography of Gavin Douglas—not excluding Mr. Small's, unfortunately—is imperfect and self-evidently erroneous. The early praise of Sir David Lyndsay while Douglas's death was a recent grief, proves this, e.g. :—

"Allace! for one, quhilk lampe wes of this Land,
Of Eloquence the flowand balmy strand [stream].
And in our Inglis rethorick, the rose,
As of rubeis the charbuncle bene chose!
And as Phebus dois Cynthia precell [excel].
So Gawane Douglas, Byschope of Dunkell,
Had, quhen he wes in to this Land on lyve,
Abufe vulgare Poetis prerogatyve,
Boith in pratik and speculation.

"I saye no more, gude Redaris may deservye
His worthy workis, in nowmer mo than fyve;
And speciallye, the trew Translation
Of Virgill, quhilk bene consolation
To cunning men, to know his gret ingyne [intellect].
Als weill in naturall science as devyne."

(Laing's *Lyndsay*, i. p. 61.)

The *Complaynt and Testament of a Popeniay*, wherein the Lyon King of Arms thus turned aside to celebrate his fellow—"Maker," appeared in 1538, and on its title-page tells us that it was "finysshed the xiiij. day of Decembre, in the yere of our Lord 1530," or within nine years of the Bishop's death. It seems clear that Chapman and Millar, or other early Scotch typographers, preceded Willyam Copland, of "Flet-stret," London. Moreover, are not the abounding mistakes of the 1553 edition to be explained, in part at least, by Copland's want of acquaintance with the old Scottish language? Sir David Lyndsay would hardly have spoken of Douglas's "worthy workis, in nowmer mo than fyve," as accessible to "gude Redaris" to "descryve," unless they had been in print, not locked up in a few MS. copies. Further persistent research will doubtless yield much earlier impressions; and indeed it strikes one as almost certain that, having completed so extensive an undertaking as his *Aeneid*, its Author must himself have seen to its publication; while the "Palace of Honour," and even "King Hart," would fail of their avowed object if they were not printed long previous to 1553. Again, none of the editors, from Ruddiman to Mr. Small, has so much as tried to get at the "worthy workis" described by Lyndsay as "in nowmer mo than fyve." Very much more painstaking in pursuit of the "lost works," as they are called, was due. Unless the *Aeneid* be split into the "Prologues" and the Translation, and the slight poem of "Conscience" be exalted into a "work," the "fyve" are not known. It is barely possible that the "Dialogus inter duos famatos viros M. Ganninum Douglaseium virum non minus eruditum quam nobilem, Ecclesiae Beati Aegidii Edinburgensis Praefectum et Magistrum Dav. Cranstonum in Sacra Theosophia Baccalaureum, optime meritum," which Major prefixed in 1509 to his Commentaries on the First and Second Books of the Sentences of Peter Lombard, was one

of the "fyve." Bale enumerates *Narrationes Aureae* and *Comoediae Aliquot Sacrae*. These Latin titles of English books, as usual with Bale, obscure their English ones. Nevertheless, Mr. Small would have done well to refuse acquiescence in the indolent tradition of "lost works," and addressed himself to a critical examination of at least the many anonymous and semi-anonymous contemporary Enterludes and Mysteries. The Devonshire, and Bodleian, British Museum, and kindred libraries, might restore to Douglas both the *Narrationes Aureae* and *Comoediae Sacrae*. His words are so peculiarly in various cases his own, and have sometimes such a specific Scottish form, that a capable reader like Mr. Small could hardly fail to determine the authorship in agreement with Bale's Latinized titles. Lyndsay's closing words—

"his great ingyne
Als weill in naturall science as devyne,"

look beyond the *Aeneid*, and assure us of other achievements of Douglas's intellect and culture that surely an effort ought to be made to trace.

As it is, the present collection of the "Poetical Works"—though other things in the apparatus might easily have been, and better, spared to give us the autobiographical "Dialogus," and so the complete works so far as at present known—affords ample materials whereby to estimate the place of Gavin Douglas as a poet, and the worth of Mr. Small's edition.

Whoever will really study the "Prologues" to the successive books of the *Aeneid* and Matheus Vegius' thirteenth book, will not only agree with Warton, that "Douglas's proper walk was original poetry" (*History of English Poetry*, s. 30), but that the originality is very remarkable for the period, constituting him a genuine Maker (in the fine old sense), and specially, possessed of wide-open, almost Wordsworthian and at times Shelleyan penetrative eyes for external Nature and a subtle and inevitable utterance. The loss is, and the sorrow, that editors and critics forgetting that such poetry is for adults, not children, and adults who are prepared to give up patient and reverent days and nights to the mastering of the language in its quaintness of orthography and construction, have interposed between Douglas and his readers by substituting all manner of paraphrases and so-called translations for the original—in deference, I suppose, to your snatch-and-run reader whose criticism is as wooden and ignorant as Hallam's. It is an affront to the illustrious dead and the intelligent living to have such poetry diluted and transformed in the fashion, e.g. of Warton in his *History of English Poetry*—who, in turning two of the vivid and delicious Prologues into "plain modern English prose," thus expatiates on the result: "This experiment will serve to prove their native excellence. Divested of poetic numbers and expression, they still retain their poetry; and (to use the comparison of an elegant writer on a like occasion) appear like Ulysses still a king and conqueror, although disguised like a peasant, and lodged in the cottage of the herdsmen Eumæus" (s. 30). Elegant nonsense! All very well for imperilled Ulysses to hide and disguise.

himself; but, except for school-boys, what possible call was there to transmute the glorious old verse into prose? And how inexpressibly foolish to boast that "they still retain their poetry." Indeed! Otto of roses may still hold the rose-scent; but let women have it: give us the roses themselves with their native stalks and pinky thorniness. Mr. Small is not without blame in giving in to the miserable dread of Douglas's own words, as he himself wrote them, not being understood. In his somewhat superficial and hasty jottings on the characteristics of the poet's writings, he inflicts page on page of an "account" of the subjects of the different poems, and an equal quantity of rubbish in the shape of "modernized versions" by P. Frazer Tytler, Fawkes, a "Mr. Scott" of Perth, and others, in the place of and in (to use his own words) "illustrative contrast to (*sic*) the original!" One marvels if Mr. Small had been reading "Nympha Libethris" and adopted Clement Barksdale's sentiment:—

"Whose sense will not without much study come,
Let him for me be altogether dumb:
No Persius be my Reader; but such may
As he who once throw Persius away."

Such "illustrative contrasts" win no reader worth the winning. The scholar and student deems them an outrage. Whoever cares to know Gavin Douglas will not grudge the necessary labour, the "much study" demanded to know him; and this is no more than is needed in relation to all our elder literature. Your Hallams and like superficial pretenders to acquaintance with books would be equally at a nonplus, and need to "guess at every other word" in the *Romaunt of the Rose* and even in the *Faerie Queene*. It is about time this sort of carefulness for ignorance rather than knowledge were done with. Radiant, realistic, yet edged with a delicate iridescence of imagination, musical and thickcoming as a nightingale's notes, the "May" Prologue would alone vindicate for Douglas the Poet's subtle vision; while the "Winter" Prologue has a picturesqueness, a *verve*, a nicety and daintiness of observation, a colour of epithet and a breadth of humanness in it that seem almost to coarsen the landscapes of a later time. There is the supreme stuff of poetry in all these Prologues and in the "Palice of Honour" and in gleams in "King Hart," and the workmanship, as a whole, is worthy of the material. This being so, an editor of Douglas has a right to count on his labour to furnish a true text being recognised, and his Worthy studied without the child-sweetmeats of "modernized versions."

Philologically, this edition of Bishop Douglas's poetry is extremely valuable, especially in connexion with the same publisher's editions of William Dunbar, Robert Henryson, and Sir David Lyndsay, under the editorship of Dr. David Laing, and recent reprints of Barbour, Wynton, and others to follow (it is to be hoped), as Alexander Montgomery and Alexander Hume. Hallam's notice of Douglas is even for him specially shallow and illiterate. Warton had said of the *Aeneid*:—

"This translation is executed with equal spirit and fidelity, and is a proof that the Lowland

Scotch and English languages were now nearly the same. I mean the style of composition, more especially in the glaring affectation of anglicising Latin words."

On this the historian of our literature observes:—

"Warton did well to explain his rather startling expression, that the Lowland Scotch and English languages were then nearly the same; for I will venture to say that no Englishman, without guessing at every other word, could understand the long passage which he proceeds to quote from Gavin Douglas. It is true that the differences consisted mainly in pronunciation, and consequently in orthography; but this is the great cause of diversity in dialect." (*Introd. to the Literat. of Europe in 15th, 16th, and 17th Centuries*, part i. c. iv.)

The best answer to this is, that if Hallam had turned to Chaucer, and Gower, and Langland, and other English-born poets, he would readily have found 90 per cent. of Douglas's words in them. So far back as 1638, Lisle, the Anglo-Saxon scholar, saw deeper and wrote more wisely as follows:—

"At length I lighted on Virgil, Scotished by the Reuerend Gawin Douglas, Bishop of Dunkell, and vncle to the Earle of Angus; the best translation of that Poet I euer read. And though I found that dialect more hard than any of the former (as neerer the Saxon because farther from the Norman), yet with helpe of the Latine I made shift to vnderstand it, and read the booke more than once from the beginning to the end. Whereby I must confesse I got more knowledge of that I sought [the Saxon], than by any of the others. For as at the Saxon inuasion many of the Britans, so at the Norman many of the Saxons, fled into Scotland, preserving in that Realme unconquered, as the line Royall, so also the language, better than the Inhabitants here, vnder conquerors' law and custome, were able." (Preface to *Ancient Monuments of the Saxon Tongue*, p. 16.)

It is a simple matter-of-fact, which Hallam ought to have known, that (as Mr. Small properly quotes) William Caxton, writing at London in 1496, in the preface to his *Buke of Eneydos*, states that, to make himself intelligible to "comyn people," he had to "vse old and homely terms," and that to provide himself with a stock of these, he took up a book written in "olde Englyshe" and found that "certeynlie it was more like to Dutsche than English." Anglo-Norman influences had thus in 1496 greatly changed the "olde English" in the south of England. On the other hand, in Northumberland ("Kingdom of Northumbria"), which extended from the Humber to the Firth of Forth, the language remained more native and pure, and resisted foreign ingredients. It is in this "olde Englishe" common to this extensive district that nearly all the English metrical romances of mediaeval times are written, and with it—as Warton accurately states—the language of the earlier Scottish poets is almost identical. Mr. Small sees all this, and has evidently resources qualifying him to utilise it, and it is to be regretted that his work is defective in three directions wherein he might have perfected it. (a) Related as the "Palice of Honour" is to Chaucer's "Temple of Fame"—rather than to the "Sejour d'Honneur" of Octavien de St. Galais—and "King Hart" to "Piers the Plowman" of John Langland, and the Prologues and translation of the *Aeneid* in their wording to other early English

poets, there ought to have been a critical examination of resemblances and differences, linguistic and orthographical. (b) Full and satisfying as is the Glossary—and it is really a great advance on Ruddiman's and all others—its value is much lessened by the nearly absolute absence of authorities for the meanings assigned. Not a few seem far-fetched and doubtful, and ill-suited to their place and context. Many almost provoke controversy. It is a pity, too, that parallels from English-born poets are not given. (c) The relation of Douglas to Catholicism in Scotland, and to the "new learning," especially Latin and Greek, and the bearings of both on the literary condition of Scotland at the period. The "Dialogus" showed he had small respect for the metaphysical casuistry of Lombard and his compeers. Mr. Small has left much vague and scattered which brought together would have revealed an individual potentiality in his author of which he scarcely dreams.

The Notes are very meagre, and the few discussions of words are not always satisfactory: e.g., in vol. iv. p. 85, l. 7, Toppa and Pertelok, Mr. Small very well vindicates Toppa as against Mr. Skeat's Coppa, but he errs in simply adopting Nares' derivation of *partelot*, or *partlet*, from *partelethe*, a band or ruff, because forsooth a hen is ruffed round the neck! For hens of the ordinary breeds to have a ruff is very unusual, and why, therefore, call so common a bird "partlet," while it has so rarely a ruff? Had this been the true derivation, one would have expected it to be applied rather to chanticler than his dame. I doubt also if examples of *partelethe*, a ruff, be found older, or even as old as the Chaucerian use of *portelot* or *partelot*. It is applied from a hen to a woman, not because the woman is ruffed, but because she is a noisy cackling body—cf. 1 *Henry IV.* iii. 3, *Winter's Tale* ii. 3. The derivation of *partlet*, a band, from *part*, or *porter*, as given by Minshew, and quoted by others, seems merely ridiculous. Is a band the only article of attire that can be separated from, or is borne on the body? or was it the first or only article of clothing when as yet other articles were not? We have the same root-form in the bird "*part-ridge*," but the derivation is only another instance of the eccentricities of language. Many other words would need revision and correction in the Glossary, as might easily be shown, did space allow.

The *Aeneid* occupies three out of the four volumes. Sooth to say, apart from the Prologues, we do not estimate it very highly as poetry. It was a marvellous "eighteen months' work; but it is diffuse and tame except in occasional lines and out-gleaming epithets. Mr. Small decided wisely in taking for his text the Elphynstoun MS. of his own University's library. A comparison, however, of the Gale MS. text, as reproduced by Manor and Rutherford, with the Elphynstoun, yields more various readings than Mr. Small seems aware of. It would have been an acceptable addition to the apparatus, if the editor had critically discussed the variations of all the MSS. Some of them are specially suggestive; more philologically interesting; still more very

valuable contributions to the stores of the *Dialects of England Society*.

That this additional task which we would assign to Mr. Small is demanded, will appear by a very slight examination of a single Prologue taken *ad aperturam libri*, viz., to Book VI. Comparing the Elphinstoun MS., i.e., the present text with the Gale MS., i.e., the Bannatyne Club text, the following among many more variations may be recorded:—l. 20, "It semis a man war manglit, tharon list luik," which seems very like nonsense, while the Gale MS. "*mangit*," i.e., confounded, astonished, is, no doubt, Douglas's own word; l. 37, "deid" for "deth;" and l. 65, "sax" for "sext," are grammatically inaccurate; l. 85, "throw the fall" for "from the fall," and l. 133, "nocht" for "not," seem to spoil two distinct and, perhaps, better thoughts; l. 153, "*it wer a manifest le*" for "*that war a manifest le*" (lie)—the latter more emphatic; l. 165, "*to assailze*" for "*till assailze*,"—the latter unquestionably the author's Scottish form. Startled with these results, a like examination of other portions satisfied us that a critical eclecticism would have added to the value of Mr. Small's text, while the notes could have pointed out such readings as were adopted from the Gale MS. and others, as the Longleat MS., which remains apparently unread.

Of the "Biographical Introduction," which occupies pp. i.-clxxxii., this only will we say: It is enriched with "many letters and papers from transcripts of the originals preserved in the British Museum, the Rolls House, London, and the General Register House, Edinburgh," that invite commentary. Mr. Small has been modestly content to hang these on a thin loose thread of chronology. We desiderate more compactness, more insight, more fetching of light from the poetry and documents on the life and especially the personality of the old bishop. But it has an ungrateful look to be asking more with so much of admirable work actually bestowed. A long vainly-called-for thing has been done, and the work bears evidence throughout that it has been to its scholarly editor a labour of love, combined with what is not always found, love of labour. We will part from Gavin Douglas with his portrait from *Marmion* (c. vi. 11):—

"A bishop by the altar stood,
A noble lord of Douglas blood,
With mitre sheen and roquet white;
Yet show'd his meek and thoughtful eye
But little pride of prelacy;
More pleased that in a barbarous age
He gave rude Scotland Virgil's page,
Than that beneath his rule he held
The bishopric of fair Dunkeld."

ALEXANDER B. GROSART.

Le Fond de la Société sous la Commune, décrit d'après les Documents qui constituent les Archives de la Justice Militaire. Par C. A. Dauban. (Paris: Eug. Plon et Cie, 1873.)

WE had been led to think highly of this book. A friend of ours who imagines that by glancing at its index and by turning over its leaves one can come to a fair estimate of any work, had singled out some pas-

sages of a kind to make us esteem, if not the writer's talent, at least the sincerity of his patriotism. "A book by M. Dauban has just been published," so wrote our friend, "which I advise you to read. The work is throughout, so far as I can judge from beginnings of chapters that I have run over, pervaded by a strong current of patriotism. You who have hours of forced leisure must give it a closer reading. The author's thesis is this: From our disasters sprang up the Commune; the war originated our disasters: by whom was the war originated? Elsewhere M. Dauban prefers his charge against the Second Empire, and takes to task the Imperialist *bourgeoisie* for its scandalously gotten riches. Hitherto M. Dauban had not risen above mediocrity in his '*Mémoires*' on the Terreur, on the Girondists, on Madame Roland. But is it not just possible that indignation should make an indifferent author write a good book?" So spake our amiable friend, and we were the more cruelly deceived when, chancing to meet with the volume of 482 pages, we were bound first to peruse it, and then to form our opinion. We, it is true, did not expect anything like broad views from an admirer of the Girondists, nor indeed any real power from one whose life has been spent in the midst of historical documents without his ever performing the work of an historian. But we did expect some soundness of sense and humanity; if narrowness, at least rectitude of judgment. Even this last illusion must be given up.

M. C. A. Dauban (who having remained unmolested during the Commune, was on his own confession endangered by the indiscretion of his zeal, on the entry of the regular army into his quarter), "lived three days among the soldiers," then, after victory had been secured, moved on to the rear of the military commissions. In this post he gained access to the papers that were found at the mayoralty of the eleventh Arrondissement (the last stronghold of the Commune), being more particularly satisfied with Lieutenant-Colonel Carré (whose judicious reflections he now propagates) for his intelligent indications. Those documents he has since published without displaying either the brutal indifference of such military commissions, which at least would have given them in their integrity, or the cleverness of a police officer, who, even while making suppressions, would have adopted some administrative, if not scientific classification.

It is P. J. Proudhon's peculiarity to be hateful to a certain class of minds who believe that mediocrity is the high road to common sense. Such good folks, unable to see one side of a question, fret at finding in the same page of the illustrious polemist, not only both sides, but a third point of view, which perplexes them because they never thought of it before. M. Dauban's angry bias carries him to the length of ascribing to Proudhon the paternity of Communism. We advise him to open Dupiney de Vorepierre's dictionary: he will satisfy himself that under the head Socialism the orthodox Dupiney has been content to reprint Proudhon's arguments against Communism. So Communism and Commune, it is all one for

M. Dauban. Still the Commune's was but a political programme, in which it forbore to adopt either the one or the other socialistic school. But that does not concern M. Dauban, who admits all documents against, and rejects such as would vindicate the defeated party. But—and this is more incomprehensible in one who has witnessed the ruin brought on France by imperialistic centralisation—M. Dauban is an utter stranger to the political idea of the Commune. To combat a theory one must know what it is. This is an axiom of which M. Dauban does not seem to have the slightest suspicion. In his eyes, the movement of 1871 is somewhat undefined. On one hand, the people of Paris, "whose glow of patriotism had been betrayed" by the men of the 4th of September, rebelled against rulers "who dreaded the suburbs more than the Prussians." On the other hand, this people of Paris had no patriotism, and reserved their hardihood to use it against "the Prussians of Versailles." Elsewhere, the Federals fought for their thirty sous only; here it was the Empire's moral disorder that prepared the Commune; here, the Prussians fostered underhand this great convulsion to crown their conquest. Of this last charge, so horrible, some documentary evidence should have been produced by M. Dauban, a man accustomed to historical research, or else it ought not even to have been mentioned. We beg pardon. M. Dauban exhibits one document—a German picture, where Germany is represented driving out of Paris in flames, men of all parties, M. Thiers together with M. Rochefort, Garibaldi as well as Trochu. *Gefallen, gefallen ist Babylon die stolze*. Such is the motto of the picture whose fiery but clumsy drawing seems to point to a regret that Bismarck's shells did not reduce Paris to ashes. And upon such groundwork M. Dauban builds up a whole scaffolding of insinuations! The German artist, aware, as it appears, of the secret understanding between Bismarck and the popular leaders in Paris, with his no longer prophetic but only well-informed pencil, would have shadowed forth the conflagrations in the French capital as resulting from an alliance of the Prussians with the Commune. M. Dauban made use of this picture for a frontispiece, and his comments upon it served for a preface to his compilation. This was fair enough. Thereby the author was not bound to too much impartiality.

Among the documents that figure in this bulky bill of indictment is to be found a truly odious one, which M. Dauban does not fail to turn to good account.

This letter bearing *no signature* is addressed to Citizen Audouynaud, member of the Comité Central. Its contents prove to us that the author is a madman, its introduction that he is a solitary madman, for he does not know a soul: "I address myself to you, citizen, although I do not know you, because your name heads the list of this committee, and because I presume that you will communicate my observations to your colleagues." M. Dauban forgets that it is contrary to all the rules of criticism to make a party responsible for a letter—anonymous into the bargain.

From the following opinions we shall be able to form some idea of M. Dauban's largeness of view. Do you know why M. Dauban does not look upon Tridon, author of a remarkable pamphlet on the Hébertists, as the father of Hébertism? It is because M. Tridon was rich. Do you know why the life of Delescluze has been one long struggle, and his death that of a hero of antiquity? Why, because he was a *fruit sec* of the bar. As M. Dauban thinks that calumnies should in general be propagated, above all when the object of them is dead, he repeats an accusation of M. Denormandie, in whose office Delescluze had once upon a time acted as attorney's clerk. On that subject we shall only allow ourselves to make one remark. Why has M. Denormandie waited for the death of his former clerk in order to cast a doubt upon the probity, above all discussion, of the great patriot? Did he do so in order to obtain pardon for having treated with the delegates of the Commune of the eighth Arrondissement?

Let us quote a last proof of the readiness with which M. Dauban brings forth accusations. "Received at the Morgue two bodies, of the female sex, and the shattered remains of human bodies, sent by a member of the Commune, May 17, 1871. For the Registrar. (Signed) Guiblain." Such is the record, and now for M. Dauban's commentary:—

"Whence comes that mysterious note? Who were those women? How is it that the shattered remains of human bodies were in the possession of a member of the Commune? It is evident that these corpses were not found in the river, but that they were brought from one of those executions, the number and the cause of which we have never known and can never hope to know."

Does M. Dauban suppose that the few war-spies who were condemned to death during the Commune were executed by means of mitrailleuses?

Every good bourgeois is a *Chauvin*. M. Dauban hates all foreigners, and particularly the English reporters, who, uninfluenced by party feeling, described the massacres perpetrated by the Versaillist army. A line further on M. Dauban omits the date of the Rapp explosion, which took place on May 17. This would at once have explained why the corpses of two women, and the shattered remains of other dead bodies were sent to the Morgue.

When M. Dauban framed his indictment (for in political matters it is the custom to shoot first and to indict afterwards), M. Thiers was still in power; it was still possible to say that the Chief of the Executive was making a fair trial of the Republic. The remembrance was still fresh that the provinces had been stirred up against Paris by means of the calumny that Paris was in open revolt against the Republic, and not against the Monarchical Assembly; it was not yet forgotten that Thiers had been obliged to give Republican guarantees, both in his name and in that of the Assembly: some illusions were still possible. But now have not the events come, one after the other, bearing their eloquent testimony? Has not the Assembly made its *coup d'état*? If there has not been a Royalist restoration, is it not from an impossibility to instal at once all the

pretenders to the throne? Better still, is there not a touching understanding between M. de Chambord and M. Rouher? MacMahon, is he not a living proof that Legitimist sympathies may find place in the same heart along with Bonapartist antecedents? The Royalist and Imperialist parties coalesced: do they not seem to scoff at the "gallant Marshal" for his presumptuousness in believing himself to be anything but a puppet made to play a part, until the real king of the comedy appears in flesh and blood to pour poison into the ear of France.

We have not taken in earnest the long impeachment of M. Dauban. The attempts of M. Dauban to associate the Commune and the Empire are simply childish. Was it in the ranks of the Commune that the Marquis de Gallifet figured? M. Dauban's retrospective wrath is ridiculous. What has he done to oppose that *régime* of corruption and of swindling? By what means has he protested against the declaration of war? The men who struggled against the Empire are the very same who protested against the declaration of war. It is they, again, who afterwards were found in the ranks of the Commune. Now they are dead, or in prison, or exiled, or reduced to the most humiliating silence.

And France, is she the better for their loss?

JULES ANDRIEU.

Our English Surnames: their Sources and Significations. By C. W. Bardsley, M.A. (London: Chatto and Windus, 1873.)

FEW people, however indifferent on other antiquarian matters, are without a certain secret and altogether blameless curiosity to know the meaning of their family name, and, if possible, something too of the history of its first holders. If, however, they consult Mr. Bardsley's book on the second of these points, they will be disappointed, as he deals only with the history of names, their primary meanings, and different forms at different stages of our language, and has nothing to do with their holders. We cannot but say that we somewhat regret this, for a little personal history here and there could not have failed in making his book even more interesting than it is. Perhaps, however, Mr. Bardsley considered this somewhat beside his object, and likely to make his book too cumbersome; and when we remember that he discusses considerably over four thousand names more or less at length, it is really wonderful how so much has been got together into a volume of by no means large dimensions. It seems strange how little has been written on our common English family names. We have books of Peerage, and Baronetage, and Landed Gentry enough; but the books on the common familiar names that we see and hear every day, we could count on the fingers of one hand. Of these by far the most deserving are Mr. Lower's *Patronymica Britannica*—a compendious and most handy dictionary—and Miss Yonge's *History of Christian Names*, also a valuable book. It is, however, with surnames only that we have here to deal.

To review the sources of a people's name-stock is, in a certain sense, to review its history and language. If we remember

that names, whether of person or thing, are not the result of blind chance, but were given by men with a definite intention and to convey a definite meaning, we should be better able to realise what a record of customs, manners, and phases of mind each word must in itself contain.

"We cannot but see," says Mr. Bardsley in his Introduction, "that, could we only grasp their true meaning, could we but take away the doubtful crust in which they are oftentimes imbedded, then we should be speaking out of the very mouth of history itself. For names are enduring—generations come and go; and passing on with each, they become almost everlasting."

Mr. Bardsley begins by noticing that surnames (*supernomina*) were simply the result of necessity, when a people, hitherto small and isolated, had so far grown in numbers that it was found absolutely necessary to have some further distinctions between individuals than any mere personal ones could supply; and then calls attention to such designations in the Old Testament as "*Joshua the son of Nun*," or "*Jair the son of Manasseh*," and to those descriptive titles, or *sobriquets*, of which most early literatures give evidence; but in neither of which cases the surname would become hereditary. Mr. Bardsley then passes on to show that it is in the eleventh and twelfth centuries that we first begin to realise that a change has taken place in the nomenclature of most of the more populated and civilised European societies. Surnames have become family-names, i.e. hereditary. The baron might be called after the property he owned, or the commoner man after some local peculiarity of his abode. The craftsman might be named after his craft, or another after the rank or office he held; or again, the name might be derived from the personal or Christian name of the father or mother; or lastly, from some characteristic, mental or physical, complementary or the reverse. It mattered little which of these; but let one once become fixed to a man, and cling to him for life, it would eventually pass on to his offspring. All these—and there is no name which does not come under one or other of these heads—Mr. Bardsley divides into 1. Patronymic surnames, as "*Johnson*" or "*Emsen*," "*Hewett*" (little Hugh or Hew), "*Willcock*" (little William), "*Watkin*" (little Wat or Walter); 2. Local surnames, as "*Brook*" or "*Attenborough*" (at the borough or town); 3. Official surnames, as "*Page*" or "*Fletcher*" (arrow-featherer), which last we would not place here; 4. Occupative surnames,—firstly, *country*, as "*Carter*" or "*Dudman*" (seller of frippery at fairs); secondly, *town*, as "*Webster*" (weaver), or "*Winter*" (wyneter, wine-merchant); 5. *Sobriquet* surnames, or "*Nicknames*" (nickname = an ekename, or added name), as "*Brock*" (badger), or "*Makepeace*." All this is systematic enough; but we cannot but regret a slight want of system in the arrangement of the names under each head, which at times leads to a useless repetition; and likewise the overcrowding in places of examples, which, though very useful in a dictionary (such as Mr. Bardsley promises us), is rather apt to render the pages tedious.

To mention a few points which appear

open to criticism. It is rather startling to read (p. 39), "Giles, the patron saint of the huntsman, is but a corruption of Egidius": such was generally no doubt its Latin equivalent, but it is very much more likely, as Miss Yonge suggests, that the good Athenian who lived on the banks of the Rhone towards the close of the seventh century, and is supposed to have been originally named Aegidius (*Aiyidios*), derived his later name from the Celtic *giolla*, a servant, or the Teutonic *gilo*, a pledge, or even from a corruption of the Latin "Julius;" in any case, however, some explanation is needed, and none is given. Again, Mr. Bardsley says, "Tiddeman" (spelt also "Tydeman") is the same as the Dutch "Tyddemar." This is going, we think, too much out of our way; why should he not derive it from the old Lowland Scotch *tiddle*, cross in temper, or, as Mr. Lower does, from the Old English *tydy*, merry, hearty or neat, which is Scotch too? "Cuddie," an old name for an ass, Mr. Bardsley unhesitatingly puts down as the same as the familiar pet name for "Cuthbert," which was also "Cud-die," while such an authority as Dr. Jamieson gives it as his opinion that it is an Oriental word introduced by the gipsies, and no doubt the same as the Persian *qudda*, an ass, and the Hindostanee *ghudda*, which has the same meaning. "Magpie," written also "magotpie," we are told, is derived from "Mag" (sometimes, but rarely "Magot"), the familiar of "Margaret;" why, we cannot see. We have little doubt that the word is connected with the old Scotch *magg*, to steal, or else with the French *magot*, a monkey (or sometimes hidden treasure), as either would convey a good idea of the bird's peculiarities. We have also seen other derivations of this word which are much more probable than Mr. Bardsley's. "Cullings," "Cullens," or "Collinges," we do not think at all likely to be merely corruptions of "Cologne," when they occur as surnames, but have much more to do with "Collin," or "Colin," the diminutive of "Nicholas," or derived, as it is sometimes said to be, from the Irish *cuilean*. "Nott," or "Knott," we should put down as later forms of "Cnut" or "Canute," and not as conveying the idea of "not- or nut-headed," close shaven. "Waddilove" or "Waddilow," which Mr. Bardsley finds written in the Hundred Rolls and the Guildhall Records "Wade-in-love," we much prefer, with Mr. Lower, to derive from an old name "Wadel," "Wadhel," or "Wadelo," found in the *Domesday Book*, and probably connected with "Wade," an old heroic name well known in Norse legends, or from the Scotch *waddin*, Anglo-Saxon *waddend*, both of which mean strong, powerful, rather than to indulge in the extravagance of talking of some one who "waded in love." We do not understand why Mr. Bardsley need go to the French *eskirmir* for both our *skirmish* and *scrimmage*: it is true that the suffix *-ish* would point to a French *-ir*, but the root of the words is decidedly Teutonic, and the initial *e* of the French seems strongly to indicate one of their many failures to pronounce the initial Teutonic *sc*. *Hremman* or *scremman*, to hinder, disquiet, scream, is a good old Saxon verb (Germ. *schirmen*), and such words as *cottage*, *tillage*, &c., show that the Romance suffix *-age* (Lat. *-aticum*) was often

enough joined to a Teutonic root. Why does Mr. Bardsley call a *Yeatherd* a herdsman of *heifers*, when the word is plainly enough the same as the Anglo-Saxon *gáthyrd*, or goatherd? "Stotherd" again (giving our "Stoddards," "Stoddarts," and perhaps "Studdy") he interprets as *bullock-herd*; *stott* may have been an old Northern localism for *bullock*, but the *Promptorium Parvulorum* gives *stot* only as *horse*, and the *Anglo-Saxon Dictionary* gives *stód*, a stud of breeding *steeds*, especially mares.* Lastly, we must say, that the misspellings in the text are uncomfortably numerous; a fault not to be overlooked in a book in which so much depends on the way in which the names are spelt. For instance, several times we find "Mr. Lowen" put for "Mr. Lower;" in another place "Lawrence Mind" for "Lawrence Minot;" and again, the strangest mistake of all, "Miss Muloch's *History of Christian Names*" quoted instead of "Miss Yonge's."

But to turn to the better side of the book, which is also so very much the larger—Mr. Bardsley makes a very good suggestion towards the solution of the enigma of our curious inn-signs. Instead of such ingenious interpretations as "Goat and compasses" for "God encompasseth us," or "Bull and gate" for "Boulogne gate" or "Boulanger," he suggests that, as at the time when these signs were most used and of most use, the generality of people could not read, and mottoes and texts would thus have been quite useless, wherefore signs were used as marks of distinction instead of names (as at the present day); and that accordingly, when two tradesmen entered into partnership, it is probable enough that they joined their *signs* where they would now join their *names*. Again we must thank Mr. Bardsley for showing the enormous popularity of the name "John" over all others towards the end of Edward III.'s reign, and during that of Richard II.—a popularity that, as our national hero "Jack" and our national name "John Bull" should teach us, has seldom been other than great; for he thereby overthrows the statement of the majority of historians, who, when commenting on the clause in Wat Tyler's charter "that there should be no king named John," are wont to assert that this was not necessarily aimed at John of Gaunt, because the peasants of England at this time shared with those of France and Scotland an intense prejudice against the name of "John,"—this, from Mr. Bardsley's facts, we see was not the case.

In a word, we can thoroughly recommend *Our English Surnames* to all those to whom English, and things English, are of interest.

H. COURTHOPE BOWEN.

A History of Greece. By George W. Cox, M.A. Volumes I. and II. (London: Longmans & Co., 1874.)

In these two volumes the learned and ingenious analyst of the Aryan Mythology

* I find, however, in Stratmann "Stot, Swed. stut (juvencus)?" showing that the word *may* mean heifer, but that he considers it doubtful. "Buculus" he gives as a more common meaning of the Swedish derivative, though in any case the word is rare.

carries his *History of Greece* from the earliest times to the end of the Peloponnesian War. A third volume is to bring the work down to the death of Alexander. A fourth volume is to bring it to the revolution which ended the reign of the Bavarian Otho.

Bishop Thirlwall's *History* is a judicial narrative by a consummate scholar; Grote is before all things the great interpreter of the Athenian democracy; Curtius is the historian of Greek culture in the largest sense, bringing the results of Comparative Philology to bear on its beginnings, and with a special faculty for setting forth vividly the local laws of its development. Can Mr. Cox's *History*—for which he expressly disavows any claim to set aside these—be said, so far as it has gone, to have a like distinctive character? It might, we think, be described as a sceptical analysis. Mr. Cox does not give us, on the whole, new ideas or new pictures. The new things (after the treatment of the mythical period) are, in the main, criticisms of detail. Opinions will, perhaps, differ among students as to how far Mr. Cox's book can be safely taken for a guide. But, along with Thirlwall, Grote and Curtius, it will certainly deserve to be read as an acute commentary.

For Greece, the period of contemporary record may be said to begin about 450 B.C. Before that time we have, as a rule, only tradition, supplemented by antiquarian or philological evidence. The distinctive feature of Mr. Cox's first volume is his manner of estimating this tradition as a source of history. Speaking generally, we may say that he is ultra-sceptical. As Curtius uses Comparative Philology to construct, Mr. Cox uses Comparative Mythology to destroy.

Three chief schools have divided modern opinion about the Greek myths. The Pragmatizing or new Euhemeristic school strips the myth of what is marvellous or impossible, and sets forth the residuum of possible fact as historical. It is true that Achilles slew Hektor, though it is not true that he was helped by Athene. Mr. Grote exploded this method. The Allegorizing, or old-physical, school finds in the myth a conscious symbolism of natural phenomena. The poet who describes Odusseus sailing westward is covertly describing the journey of the sun. The Comparative, or new-physical, school treats the myth as developed unconsciously from natural phenomena. The poet who tells the tale of Odusseus is not thinking of the sun, does not know the origin of the story; but, nevertheless, the story has grown out of a primitive solar allegory. Mr. Cox's *Aryan Mythology* is the most complete statement of this last view.

When Mr. Cox comes to apply the Comparative method to Prehistoric Greece, one general characteristic is apparent throughout. Mr. Cox often quotes Mr. Freeman, but he does not seem to us to have weighed enough what Mr. Freeman has said on this subject of Tradition in one of his best essays—that "On the Mythical and Romantic Elements in Early English History." As Romance is to History, so is Myth to Tradition. An historical statement is one which is accepted as true because it rests on contemporary or other sufficient evidence—

having sometimes, however, to be distinguished from the pseudo-historical, or invention with a purpose. Romance is the play of fancy, without purpose, around historical names or things. Genuine Tradition is the oral history of times for which there is no contemporary written history. Myth bears to genuine tradition the same relation which romance bears to history. The task of disengaging genuine tradition from myth is analogous to that of disengaging history from romance. Experience of the latter process helps the former; from the better-known we can work back to the less-known. Now, the characteristic of Mr. Cox's dealing with prehistoric Greece is that he makes hardly any attempt to disengage the genuine from the mythical element of tradition. He despairs of finding any genuine tradition—that is, any history—in the myths. They are delightful stories; they are also documents for “the mental condition of the Greeks and the growth of their polity and law:” for instance, Andromache and Nausikaa show that the condition of women was indefinitely higher in the days of the poets than it was in the days of Perikles. But that is all. No shadow of real events is to be looked for in the myths. Take, for example, the legend of Troy:—

“This is a tale,” says Mr. Cox, “which we find with all its essential features in every Aryan land; and, therefore, if such a war took place, it must be carried back to a time preceding the dispersion of the Aryan tribes, and its scene can be placed neither in the land of the Five Streams nor on the plains of the Asiatic Troy, not in Germany, or Norway, or Wales.”

The legends of the Dorian Migration are given up as equally hopeless: “Whether the eastward migrations which are said to have been caused by the return of the Herakleids represent any real events, we cannot tell, although we cannot in terms deny it; but the fact remains that they are movements eastward, corresponding in many of their features to other movements which are said to have preceded them.” That is, they illustrate a certain law of reciprocity which Mr. Cox thinks that he finds in the myths, and which he accounts for by their origin, as representing the succession of day and night. When Herakles dies and Eurystheus persecutes the Herakleidae, this is the victory of darkness over light; when Theseus and the Herakleidae slay Eurystheus, this is the victory of light over darkness. In short, “all that can be said about these legends as a whole is that the historical character of any of the incidents recorded in them can be attested only by evidence distinct from these myths; and no such evidence is forthcoming.” In a note Mr. Cox adds: “It is forthcoming in the case of the stories told about Roland and the Great Karl, and the result is to prove the impossibility of deriving any history from the myth if the independent historical testimony had been lost.”

Now, it happens that this very example has been used by Mr. Freeman to illustrate the analogy between the process of getting history out of romance and the process of getting tradition out of myth. Let us see how far the result ought to modify Mr. Cox's conclusion. The Carolingian legend contains

two distinct elements—the romantic and the historical. The romantic element consists in giving Charlemagne a personal character which was not that of Karl, in making him, not a German, but the national hero of a people who at that time were not a nation, in sending him on crusades to Constantinople and Jerusalem. The historical element consists in preserving the fact that there was a time when a single emperor reigned from the Eider to the Ebro, and that this emperor was a great captain. Just so in the Trojan legend it is probable that the mythical element is combined with an element of genuine tradition. Without contemporary evidence it would have seemed unlikely that one emperor had ever reigned over all Western Europe; but we happen to know that it was so. According to the Trojan myth, Agamemnon is, if not sovereign, at least suzerain of nearly all Greece: and he wages a war in the Troad. Here we can get no such certainty as that which we have in the other case. But the analogy affords a probability. It is likely that there was a time when a single dynasty were at least suzerains of a great part of insular and peninsular Hellas. It is likely that there was a warfare by which the north-west coast of Asia Minor was gradually hellenised. The myth puts the seat of the Pelopid dynasty at Mykene—an utterly insignificant place—where, however, great remains have been found. The romance transfers the capital of Karl from Aachen to Paris. It would not have been likely, as Mr. Freeman observes, to have transferred it from Paris to Aachen. Again, there was a real Roland, though he was killed fighting against Gascons, not against Saracens: there may well have been a real Achilleus, though it was not he who took Lesbos. Mr. Cox, however, would simply throw the Trojan legend overboard altogether. Surely this is to give up a part of the work which the real historical sense has to do. The historian ought to remember that tradition is a possible source of history, generally inferior in degree of value to contemporary record, but not different from it in kind; and that, however fanciful the dress of the tradition may be, it is part of his task to look for what is real in it. It seems to us that a good deal of Mr. Cox's ultra-scepticism—as we think it—is due in a special way to that solar theory which plays so great a part in the doctrine of the Comparative school. Herakles is as much the sun as Zeus is. The Comparative school refuses to distinguish a myth about a hero from a myth about a god. Now the distinction may be important. Mr. Cox regards the theological myths as mainly mere popular appendages of the theology of the higher thought. Possibly. But at any rate it is clear that myths about Herakles or Hengest are more likely to have begun from the doings of a man than myths about Zeus or Woden. The investigation of myths about gods, with all their alloy, belongs in the main to a science of religion. The investigation of myths about heroes belongs in the main to history. In so far as a poet is the authority for both, it is of course true that, in Mr. Cox's words,

“the achievements of Hektor, Achilleus, and Sarpedon are as much or as little attested as the

terrific combats of Zeus with Typhon or the Titans, or the torturing of Prometheus on the crags of Caucasus.”

But that does not seem to be the point. The point is that, when we search into myths about the gods, we expect to find chiefly traces of religious beliefs. When we search into myths about heroic men, we may at least hope to find traces of historical facts.

The legends of the Dorian Migration must surely be taken, as hitherto they have been taken by all historians, to represent what is in the main a true story. There must have been such a thing as a Dorian movement eastward. But here, again, Mr. Cox sees only a swing of the solar pendulum. This instance—belonging, as it does, to the last phase of a mythical age, a sort of gloaming—leads us from Mr. Cox's treatment of myths proper to his treatment of those traditions which have not an obviously poetical dress, and which concern quasi-historical persons. Grote and Curtius agree with preceding writers in regarding Pheidon, the Temenide king of Argos, as a real person, and as one about whom at least two things are well made out—that he beat the Spartans back from the borders of Argolis, and that he reformed commerce by adopting the Babylonian system of weights and money which Phoenicians and Lydians had made current in Asia. When Mr. Cox comes to Pheidon, he points out that Herodotos puts him about 590 B.C., the Parian marble about three centuries earlier, while Theopompas makes him sixth, and Ephoros tenth, descendant of Temenos. “In short,” Mr. Cox concludes, “we know nothing whatever of the man or of his time.” Granting the exact date to be doubtful, surely we have satisfactory evidence for certain general statements about the man. To meet this evidence with blank negation, is surely to carry scepticism to an altogether extravagant length. Lykourgos is another strong case. Curtius, like Grote, observes how dim to the ancients were the outlines of the Spartan lawgiver's personality; how symbolism had grown around his name; how his father was called Eunomos, and his son Eukosmos. But then Curtius adds: “And yet from all this it is not to be denied that there really lived and worked in the first half of the ninth century a legislator of the name of Lykourgos.” Mr. Cox, however, would deny it. He does not, indeed, make Lykourgos the sun; though we should have thought that the founder of the Pheiditia might have been identified with the sun-god, in his summer zenith, imposing abstinence. But he says “the Spartan lawgiver must be banished to the cloudland.” He is a beneficent civiliser neither more nor less ideal—to use Mr. Cox's own illustration—than Prometheus, Hermes, or Phoroneus.

If Mr. Cox's exaggerated bent—as we deem it—towards scientific scepticism, makes his treatment of tradition on the whole unsatisfactory, this very same quality has helped him to give a singularly clear and good account of the beginnings of Aryan, especially of Greek, society. He does not idealise the patriarchal state. He shows how the old-world tendency to absolute political isolation, as contrasted with the mo-

dern tendency to international union, had its origin in a fact which can still be understood with ease by the Low-Dutch mind. This is the fact, that in the beginning every Aryan man's house was his den. It was something which he kept, with the jealous ferocity of a wild beast, for himself and his own: something which no other living thing might enter except at the risk of life. The dead master of the house being worshipped as still existent, and as even more powerful for evil than on earth, his eldest son, or living vicegerent, was priest as well as king. By degrees strong houses (genê) joined and made brotherhoods (phatriai), with a common worship distinct from each house-worship; the brotherhoods formed tribes (phulai); the tribes formed a polis or state. But in these leagues, smaller or larger, two things are to be noted. First, that the tie was religious, not political. Secondly, that the motive was local neighbourhood. The reason why poleis did not join and make a Nation was local too. Parliament was conceived only as a Primary Assembly.

When Mr. Cox goes on to show how, though there was politically no Greek nation, there came to be a national sentiment, it is natural to compare his second, fourth and seventh chapters (especially) with the great chapter of Curtius on the Unity of Greece (bk. ii., ch. iv.) Curtius sets forth how in early times the centres of Hellenic unity were the temples of Apollo, and how this unity was strengthened by the Apolline priesthood. The priesthood was not a caste or an order. It consisted of persons or families here and there who were supposed to be specially favoured by the gods, and who bequeathed their office to their heirs. The first priests of Apollo, coming from Asia Minor, were missionaries of culture no less than of religion. The temples were centres of civilisation as well as of worship. Delphi, above all, was the very *ὀμφαλός* of Hellas: not an ideal centre merely, but the political centre of Greece in its relations either with the individual state or with barbarians. What we most miss in Mr. Cox, as compared with Curtius, is this clearness about the early significance of the temple, and chiefly of Delphi. Mr. Cox fully recognises religion as the bond between house and house, phratría and phratría, tribe and tribe. But he does not seem to recognise any such central and Panhellenic influence, directly religious, as Curtius finds in the Apolline ritual. The nearest thing to it which he seems to recognise, is the indirectly (sometimes remotely) religious influence of the great games. Again, the unifying power of art (especially plastic art) is connected with religion more immediately by Curtius than by Mr. Cox. In short, Curtius gives us a picture of a real unity, primarily spiritual, having the Apollo-worship, variously active, for its central principle: Mr. Cox rather enumerates several things which tended to modify the normal Greek instinct for political separation. But, at all events, no one has brought out with greater clearness than Mr. Cox this great truth that, in so far as there was a national unity, its origin was religious, not political.

Next to the treatment of the mythical period, the most distinctive thing in these

two volumes is the general estimate (bk. ii., ch. i.) of Herodotos, as an authority for the traditions of the Persian Wars. The chain of supernatural causation which Herodotos interweaves with human agency has little or nothing to do—Mr. Cox points out—either with conscious fiction or with love of romance; it simply represents a spiritual need of the time. The Herodotean sequence of cause and effect is usually either ethical or religious rather than political. This chiefly theological treatment gives a certain epic unity, and epic requirements in their turn modify the story. The result is that the real motives or causes—arising out of political circumstances—are often almost put out of sight. Two questions are suggested to us by this most interesting chapter, and generally by the whole of Mr. Cox's second book. First: Has Mr. Cox at all overstated the inseparableness of the supernatural detail from the substance of the Herodotean narrative; for instance, in regard to the capture of Sardis (Her. I. 78, 84), is it true that, if we give up the snakes and the woman-born lion, &c., "all the circumstances of the capture are gone"? (vol. I. p. 255). Secondly: Has Mr. Cox at all underrated the average worth of such collateral evidence for a tradition chiefly oral as that of state-registers, works of art, and the like—for instance, of the monumental evidence to which Herodotos appeals for points in the story of Midas, of Gordias, of Arion, of Kroisos, of Kleobis and Biton? At present we are disposed to answer both questions in the affirmative. But they deserve to be carefully and patiently weighed. We broach them here only for the purpose of especially commending them to students of Mr. Cox.

The Persian Wars form the borderground between tradition and history. We have noticed some salient points in Mr. Cox's treatment of tradition and of this borderground. The second volume ends at 404 B.C. When the third volume shall have brought the work to the death of Alexander, there will be more complete materials for estimating Mr. Cox's way of dealing with that Grecian history which rests on contemporary written record.

R. C. JEBB.

MINOR LITERATURE.

Nach dem Griechischen Orient. Reise-Studien, von K. B. Stark. (Heidelberg, 1874.) The combination of a popular style of writing with scientific research is very rare in Germany. It is too common for scholars to look upon the graces of style as meretricious ornaments unworthy of the seriousness and depth of truly scientific writing, and, on the other hand, it can hardly be said that the "general reader," so well known in England, is to be found in Germany in sufficient numbers to induce authors to model their style for his benefit. There is a greater division of intellectual labour in Germany than anywhere else. Most readers confine themselves to a very narrow sphere, and the effect of these two causes is a scarcity of books like those of Lavard, Buckle, Darwin, Tyndall, Mill, and a host of other eminent writers, who understand how to treat abstruse and difficult subjects in a manner intelligible to the "general reader."

Professor Stark's book is an exception to this rule. It tells, in a pleasant, unpretending style the adventures and incidents of a journey to the East, a region now so familiar to most of us that

it is not a very easy task to say anything new about it. His chief object is to measure the past glory of the countries he has visited, and more particularly to determine how far that glory may be due to Hellenic literature and art, in which he is quite at home. He takes us to the site of ancient Troy, unhappy Troy so fiercely contended for by Greeks and Dardanians in times of old, and now again the object of scarcely less fierce, though bloodless contention between rival antiquarians, divided into two hostile camps, and unable to decide whether the city of Priam occupied the head of the valley of the Skamander, or stood not far from the sea. Professor Stark is decidedly in favour of the higher position, and opposes the view taken by Dr. Schliemann, who has been excavating for several years on the site of the later Roman Troya.

From the plain of Troy the traveller proceeded to Lesbos and Smyrna and to the interesting ruins of Ephesus, where he rejoiced in the discovery, not only of the true site, but of actual remains of the great temple of Artemis, revealed by the ingenuity and the untiring exertions of Mr. Wood. Perhaps the most interesting chapter is that on the so-called tomb of Tantalus, and the rock of Niobe, respectively near Smyrna and Magnesia, which transport us to ages anterior even to Homer and the war of Troy. It may not be known to the generality of English readers that Professor Stark is the author of a good-sized volume, containing a mass of archaeological and mythological research, grouped round the sculptured relics and myths of the House of Tantalus and Niobe. In the present volume the author touches but slightly on the religious conceptions embodied in these primeval myths, in which the nature-worship of Greece found its earliest poetical expression. All that is necessary to prove his scientific conclusions is thrown into notes, which fill forty pages at the end of the volume. Here ample references and quotations are given, by which the scholar may test the truth of the author's views.

The last portion of the book, which gives an account of the traveller's return through European Greece, contains little that is absolutely new, but much that is interesting with reference to the state of society and the prospects of the country. The author had neither time nor means at his command to make excavations, or to penetrate into localities hitherto imperfectly known. He has therefore wisely confined himself to giving the impressions which a traveller, saturated with the lore of ancient Hellas, and glowing with enthusiasm for ancient art, must naturally feel on first visiting the localities hallowed by the great men who are still venerated as the teachers of mankind in all that is beautiful in literature and art.

W. IHNE.

MISS COOPER'S *Life of Thomas Wentworth, Earl of Strafford* (London: Tinsley Brothers) will probably be of use in spreading amongst that class of readers who would never approach the two folio volumes of the *Strafford Letters*, a knowledge of the leading facts in the life of the great Royalist statesman. Miss Cooper has at least avoided the rock upon which the majority of biographers make shipwreck, and is able to see that Wentworth as well as Pym may be admirable in many respects without being immaculate. Her work has evidently been a labour of love. But though the letters written by Wentworth to his wife, which Miss Cooper has obtained from Lord Houghton's collection, will be read with interest, it cannot be said that she has succeeded in throwing any new light on Wentworth's career, excepting, perhaps, by the suggestion that his most outrageous actions may be found to coincide with a peculiarly sharp fit of the gout.

Miss Cooper, in fact, has unconsciously criticised her own book when she says, with reference to the verdicts of the Connaught juries (i. 384):—

"Juries were then no more immaculate bodies of men than now, and often arrived at verdicts which were the very licences of wrong. But they are the

only guide for those who do not care to go through volumes of conflicting evidence and judge for themselves."

Her book, in short, is a good specimen of the sort of work which is done by people who do not care to go through volumes of conflicting evidence. She has got up the Life of Strafford without possessing more than a conventional knowledge of his contemporaries, or of the controversies of his day. Of matters actually in print relating to Strafford himself she frequently knows nothing. The only one of Mr. Forster's books which she appears to have consulted is the mere sketch of Eliot's life in the *Lives of British Statesmen*; and she consequently passes over the notable scene in 1625, in which Wentworth stood his ground in the committee on the disputed Yorkshire election, and the speech in which Eliot branded him as a Catiline, with a mere reference to Eliot's opposition. She shares with many other people a strong feeling against Laud. Probably she never read his works, or she would have known that he distinctly denied the correctness of the account of his consecration of St. Catherine Cree Church, which she quotes unsuspiciously from Rushworth (i. 146). In the same way she says that Laud justified the painting of God the Father in the window at Salisbury, broken by Sherfield, on the ground (i. 148) that the Deity had been in Scripture called the "Ancient of Days." Laud's words were:—

"I do not think it lawful to make the picture of God the Father. . . . I do not think but the representation of God the Father (as in the prophet Daniel he is called the 'Ancient of Days') hath been allowed, though erroneously, to be made like an ancient old man."

It is for Miss Cooper to explain the discrepancy.

On constitutional matters Miss Cooper usually contents herself with generalities, and is fond of charging Charles with breaking his coronation oath by governing contrary to law, at a time when the meaning of those laws was the very point at issue. Once or twice, however, she descends to particulars. She tells us (i. 21) that Charles, between his accession and the meeting of his first Parliament, "issued warrants for raising troops for the war in the Palatinate on his sole authority"—in which part of Germany, by the way, there was no war going on at the time. She then proceeds as follows—

"and to pay their expenses he levied a tax on the people which he called 'coat and conduct money,' for the dress and travelling costs of the soldiers, promising that it should be repaid out of the Exchequer. This alone was sufficient to check all confidence."

Miss Cooper evidently thinks that coat and conduct money was a new invention of Charles's; an opinion which was not shared by contemporaries. Their objection was not that it was levied, but that it was not repaid. S. R. GARDINER.

M. LÉON WALRAS, Professor of Political Economy at Lausanne, has just published a paper entitled *Principe Mathématique de l'Echange*, which was communicated by him last year to the Institute of France. M. Walras is about to publish a treatise on political and social economy, of which the first volume will be devoted to "pure political economy," that is to say, abstract political economy, and will contain the mathematical theory of exchange, of which the paper now published indicates the principle. We make no doubt of the mathematical talent and ingenuity of M. Walras, but we are not of those who look for either light or fruit in economics from an attempt to give mathematical form to the exposition of economic laws. The urgent economic need of the time, to our mind, lies in the very opposite direction. What is called for is not abstraction, formula, extreme generalisation, but the observation of the actual facts of the economic world, and the discovery of their causes and connexion. M. Walras seems to be of opinion that the late Mr. Mill's treatment of

political economy was essentially mathematical, though not presented in mathematical form. And there are certainly some expressions in his work which, taken alone, might give colour to such a view; but nothing could be more contrary to its general purpose and method. We know, indeed, from Mr. Mill's own lips, that he absolutely rejected the idea that economic laws are susceptible of mathematical exposition. As a mathematical exercise, the work which M. Walras proposes may possess high merit; and if we might borrow an expression from a famous scientific association, we should be disposed to refer it from the economic to the mathematical section of the field of science.

MR. BRASSEY'S "Address to the Annual Conference of Co-operative Societies" contains some instructive facts and statistics, but does not throw much light on the future of co-operation. It treats first of co-operative distribution, and the proposition, that the co-operative system tends to displace retail trade, might almost, if it stood alone, make Archbishop Whateley rise from his grave. That distinguished prelate taught that the perfect adaptation of supply to demand by the retailers of food is the strongest proof in all natural theology of omniscient and benevolent design. We are not of the Archbishop's mind as to the perfection of the retail system, but his ghost may be laid by Mr. Brassey's statistics (p. 5); for we do not see in them much ground for believing that retail trade is about to be displaced by co-operation. The extent of co-operative trade is as yet altogether insignificant in comparison. Passing from co-operative distribution to the still more important subject of co-operative production, Mr. Brassey raises our hopes to the highest point by two propositions: 1. "By co-operative production a standard may be established for the adjustment of wages." 2. "A more equal distribution of wealth may be obtained by co-operative production." It is rather disappointing after this to be told only of formidable difficulties in the way of the system; and, finally, that they are such "that the number of these societies may almost be counted on the fingers. Though some of the experiments actually tried have been successful, the failures have been more numerous than the successes." Nor does one find much help towards the solution of the problem in the exhortation: "Let the co-operators pursue their noble task, undaunted by difficulties, and inspired by a worthy ambition for independence." In the discussion of collateral topics in his address, Mr. Brassey says: "The rise in the rate of wages has been one of the most remarkable phenomena of our day. The consequent rise in prices presses with a heavy burden on every individual." Is this quite a fair description, on the part of a capitalist, of the relation of the late rise of prices to the rise of wages? Was the rise in the price of coal, for example, preceded by, and strictly proportioned to, the rise of wages? In the same page we are assured: "There is nothing new to economic science in our recent experience. All the oscillations in the labour market can be fully explained by the law of political economy that the rates of wages, like the prices of commodities, are regulated by demand and supply." What real light is thrown on the movements of wages and prices by the old formula of demand and supply—a formula so vague that several different meanings, some of them absolutely false, have been put upon it? Speaking of compensations for low wages, Mr. Brassey grows poetical:—

"The rustic labourer has a garden gay with flowers. The leafy shades protect him from the noontide glare, and his ears are soothed by the melodious minstrelsy of nature—the moan of doves in immemorial elms, and murmuring of innumerable bees. His labours are performed in the free fresh air. They are varied and interesting. They tend to invigorate, rather than to exhaust, his physical powers. The term of his life is longer. His health is more easily preserved. The charms of the rural life, as sung by

the poet, and painted by the brush of a Linnell or a Birkett Foster, are to some natures inexhaustible. The golden corn, the purple heather, the sunny foreground, and the mellow distance," &c.

Tell that to the rustic labourers of Dorsetshire, Devonshire, or Somersetshire! Who that has seen the joyless, weather-worn, prematurely-stooped, rheumatic, poorly fed and clad farm labourer of fifty, in one of those counties, could have supposed that he has had the compensation for low wages which Mr. Brassey's lyrical effusion indicates? T. E. CLIFFE LESLIE.

NOTES AND NEWS.

PROFESSOR G. F. ARMSTRONG'S *King David* is just ready, a volume of 275 pages, being the second part of his trilogy of *The Tragedy of Israel*, of which the first part was *King Saul*.

MR. BROWNING'S new poem is expected to be out in October. It will be on an entirely new subject.

MR. TENNYSON is writing some new *Idylls of the King*. One is said to be finished. The new idylls will probably precede *Vivien*.

THE Rev. Dr. E. A. Abbott, Head-master of the City of London School, has in the press a short English grammar, entitled *How to Parse*.

THE catalogue of Mr. Henry Huth's magnificent library is nearly ready for press. It is expected to form three volumes folio, of the size of the large-paper Grenville Catalogue in the British Museum. It will not be a mere list of the books, but will give the history of the rare copies from choice libraries, and notes as to the specialities of editions.

MR. W. CAREW HAZLITT has in the press a new edition of the poet Suckling's works, in which he will give a few hitherto unprinted poems and letters of Suckling's, a facsimile of his autograph signature, &c. Mr. Halliwell has given Mr. Hazlitt leave to reprint his *Illustrations of the Fairy Mythology of Shakspeare* (1845), one of the scarcest volumes of the old Shakspeare Society. To it Mr. Hazlitt proposes to add a reprint of Ritson's *Fairy Tales, with two Dissertations: I. On Pygmies; II. On Fairies* (ed. Frank, 1831, from Ritson's MS.), and some additional remarks and illustrations.

THE University of Padua, anxious to do honour to the memory of Petrarch, the 500th anniversary of whose death is, as has already been noticed in the ACADEMY, to be celebrated on July 19 next, has appointed a committee to determine the most fitting manner of commemorating the event, and paying homage to the poet whose latter years were spent at Padua, and whose merits as one of the revivers of classical learning deserve special recognition from the University. The programme of the commemorative celebrations announces for the first day an excursion to Arqua to visit the house which he once occupied, and the spot where his remains rest. The second day it is proposed to devote to the exhibition of the Paduan MSS. and copies of the Italian editions of his works. Venice, which in the Marciana Library has preserved a rich treasure of the MSS. of Petrarch—one of its earliest donors—intends to have a separate exhibition of these interesting literary remains, and the principal director of that institution is at present engaged in writing a critical review of the poems, with a notice of the poet in the character of politician, diplomatist, and patron of literature. The library at Trieste also promises, through its chief librarian, to yield its share of critical and laudatory tribute to the memory of the poet, in an exhibition of the numerous editions of Petrarch with which it has been enriched by the liberal donation of the advocate Signor Rossetti.

THE committee appointed to decide upon the best means of erecting a monument to the poet Hoffmann von Fallersleben, whose death we recorded a few months ago, have, in conjunction

with the Duc de Ratibor, determined that it should take the form of a colossal bust, raised on a pedestal to be suitably ornamented in relief. It is to be placed in the middle of one of the finest squares of Corvey, and near the library, which was so intimately associated with the later years of the poet's long and active life.

MR. FREDERICK BRUCKMANN, of Munich and 28, Henrietta-street, the English publisher of the well-known and justly admired *Goethe Gallery*, consisting of photographs from Wilhelm von Kaulbach's drawings of Goethe's Female Characters, with an explanatory text by Mr. G. H. Lewes, has, we are informed, purchased from Kaulbach's executors the copyright of all the painter's unpublished works. These are at least 200 in number, and include among others a series of drawings of contemporary celebrities, designs for a picture of the Deluge, pen-and-ink sketches in illustration of the works of Shakspeare, Homer, Heine, &c.

On the subject discussed at the last meeting of the New Shakspeare Society, the genuineness of the Porter's speeches in *Macbeth*, Mr. Browning has given his opinion strongly in favour of their genuineness, and of their humour being worthy of Shakspeare. These were among the positions Mr. Hales maintained in his paper, and in which he was warmly supported by Mr. Tom Taylor and Mr. Furnivall.

We are very glad to find that Mrs. Horace Howard Furness, of Philadelphia, the accomplished wife of the editor of the magnificent variorum edition of Shakspeare now in course of issue, has finished her *Concordance to Shakspeare's Poems: an Index to every Word therein contained*:—

"To your audit comes

Their distinct parcels in combined sums."

Mrs. Furness's handsome volume, which matches her husband's edition in size, look, and faithful labour, contains every instance of even every particle in Shakspeare's poems, every *a*, *and*, *for*, &c., and distinguishes the different parts of speech of the same form, like *back*, noun and adverb, by italic type for the second sense. The only shortcoming in the book is its not carrying out this principle completely, so that the entries for *all*, adjective, noun, and adverb; *for* *for*, preposition and conjunction, are respectively mixed under one and the same heading. These are cases where the word (*all* or *for*) has "two or more meanings," as Mrs. Furness says, and do not come under the exception of "purely grammatical distinctions," like *in* as a preposition, and *in* as a postposition or complement of a verb—"Circles her body *in*" = encircles her body. So little change is needed to render the book consistent and perfect, that we hope Mrs. Furness will thus complete her admirable work. The book comes at a time when the close work at Shakspeare's vocabulary and metre revived by the New Shakspeare Society renders it doubly welcome. Mrs. Furness deserves the grateful thanks of every student of Shakspeare.

THE city of Leghorn has decreed the erection of a monument in honour of F. Domenico Guerrazzi, the most brilliant novelist of Tuscany, who died a short time since.

A COMMITTEE has been formed in Galicia which is collecting subscriptions for a medal to be presented to the painter Matesko. Matesko may be considered as one of the first, if not the first, of Slavonic artists.

THE psychological range possible to a Greenland is so extremely narrow that, although the Danish Church has possessed seminaries at two of the stations for many years, not one single convert has shown intelligence enough to be made pastor. At last, however, a young man of singular talent has been found, Tobias Mørch by name, and he was ordained by the Bishop of Zealand on May 13. The fact that such an ordination was unique in the annals of the Lutheran Church made the event one of great interest to the inhabitants of Copenhagen.

THE publication of an Italian Review, which will be the first Italian periodical published in Germany, is announced for September next, under the editorship of Herr Karl Hillebrand. Some of the best-known names in Italy, such as those of Villari and Gallenga, are included in the list of contributors.

THE Austrian poet Robert Hamerling, author of *Ahasuerus*, has accepted a commission to write the biographies of the most distinguished contemporary Italian writers for Meyer's *Lexicon*, beginning with the letter C. Professor Angelo de Gubernatis is engaged on similar work for the twelfth edition of Brockhaus' *Conversations-Lexikon*.

A ST. PETERSBURG publisher has in the press the complete works of the late Alexander Hillferding, who died in 1872. They will occupy six volumes, and will be invaluable for the light which they throw on the present, past, and future of the Slavonic race.

THE Academy of Inscriptions has awarded the first prize on the Gobert foundation to M. de Boislisle, for his work entitled *Chambre des Comptes de Paris: Pièces Justificatives pour servir à l'Histoire des Premiers Présidents*. The second prize was awarded to M. Tuetey, for his work on *Les Ecorcheurs sous Charles VII.*

AN ancient MS., which had evidently strayed during the Commune, was found the other day at a cook-shop, where it had been left by a mason, and had been given to the children as a plaything. The MS., which is on paper, and is evidently a copy of a still older cartulary, is entitled *Abbatia de Savignio ordinis Cisterciensis*. On the last leaf is the following entry, in a later hand than the body of the MS.:—

"Le dernier jour d'Octobre, 1425, fut pris le chastel de Mayenne par le comte de Salberri. Anglais. et fut reconquis sur le dict Anglais l'an 1448, le 28^e jour d'april, et fut mis le siège devant la ville du Mans par Charles, roy de France, le 1^{er} lundy de caresme 1447, et reconquis le jeudi absolu."

NOTES OF TRAVEL.

THE *Journal of the Society of Arts* for May 8 contains a report of a highly interesting Paper by Mr. H. G. Kennedy on the Antiquities of Siam and Camboja, as well as of the discussion which followed, in which the Chairman (Dr. Hyde Clarke) stated his ethnological views upon the early populations of Asia and America. Mr. Kennedy drew attention to the fact that the Siamese originally descended from Northern Laos, and did not become known to history until the fourteenth century of our era. The magnificent ruins of deserted cities, with their gigantic causeways, stone bridges, and megalithic temples, which excite the wonder of the traveller, belonged to the older empire of the Cambojans, and bear witness to its power and prosperity. Inscriptions seem to show that they derived their religion direct from India. Their modern descendants are indolent or barbarous. Mr. Kennedy inclined to the belief that the civilisation of both Cambojans and Siamese came rather from Hindustan than from China. Their distinctive customs and ceremonies are unlike anything that we find in the Celestial Empire, while, on the other hand, the institution of a dual sovereignty—of a major king and a subordinate one—and the ceremonial which takes place at a coronation reproduce observances found in Brahminical works of the greatest antiquity.

AN enterprising Pomeranian family of fishermen has been the means of opening on the Samland coast of the Baltic a salmon fishery, which promises to become an important branch of industry, and is of more than local interest, since the success with which the attempt has been attended shows how readily, even at apparently unfavourable spots, the sea may be made to yield supplies of food and sources of wealth in return for a very slight ex-

penditure of labour and money, provided the effort be directed with ordinary sagacity and prudence.

LETTERS from Australia announce that Mr. Forrest was to leave Champion Bay at the end of last month, and to proceed with his expedition in the direction of Mount Luke, crossing the Murchison near Mount Gould. The expedition, which consists of six men and eighteen horses, carries provisions for six months, and is especially organised for the purpose of tracing the course of the Murchison to its sources, with a view of carrying a telegraphic line along its banks, and following as far as practicable an easterly direction. If Mr. Forrest should be successful in prosecuting the object aimed at in this expedition, he will not only open to our knowledge an area of no less than 100 million acres of ground, hitherto untrodden by the feet of any white man, but he will solve the important geographical problem involved in the question of what lies beyond the water-shed of the Murchison, besides many others of scarcely less scientific and practical importance to the future development and permanent prosperity of the colony. It is not improbable that Mr. Forrest may have no better report to give us than that which Colonel Warburton supplies in regard to the regions lying beyond and to the north of the stony desert which he traversed on his line of exploration; but whatever the result may be, it evidently behoves the Colony to make itself acquainted with its own domain, and we hope the public will liberally respond to the appeal made to it for its support of Mr. Forrest's expedition, which has as yet received only a very inadequate subsidy from the Colonial Government.

DR. KARL ZITTEL, in a letter addressed to the *Kölnische Zeitung*, and printed in that journal on May 18, after announcing his return from his fourteen weeks' wanderings in the Libyan desert, and the safe arrival of the Rohlf's expedition in the Upper Nile district, describes the general results of the undertaking, which, if not of any great practical value, are undoubtedly of considerable scientific interest. The locality and nature of the districts traversed necessarily preclude the possibility of discoveries, either in regard to the tribes occupying the lands, the practicability of cultivating hitherto unused ground, or the existence of oases, lakes, or rivers. And all that the expedition has done, when considered from a simply practical and utilitarian point of view, is to decide beyond question that the Libyan desert is the most sterile and barren part of the entire Sahara; that the irrigation and colonisation of the true desert are alike impossible; and that the permanent occupation of the oases is not feasible on account of their isolated positions. These results, rather negative than positive, and which rather confirm than extend our previous knowledge, are, however, in themselves of considerable importance, by helping to set at rest long-ventilated questions. The main value of the Rohlf's expedition consists in the numerous astronomical, barometrical, geognostic, palaeontological, and other scientific observations made by its directors. Determinations of the degree of humidity and the quantity of ozone present in the atmosphere were made with great regularity; the flora of the oases was carefully examined by Professor Acherson; the fauna, including a rich variety of insects, met with equal attention, while the geology was studied with minute assiduity. In this last-named department of scientific enquiry real discovery has been made; for instead of meeting in the desert with one uniform cover of nummulites, lime, and sand, the ground was found to consist of chalk, eocene and miocene formations, intermingled with an abundant mass of splendidly preserved fossil remains. Not the least interesting of the results of the expedition are the extensive series of photographs, taken by M. Remelé, of the scenery, buildings, natives, and animals belonging to the desert.

NEW RUSH—a town which has sprung into existence since the diamond rage in South Africa, and whose birth is not yet registered on our maps—is already a town of some importance. From the *Illustrirte Zeitung* it appears that it contains six churches, two large public halls, a circus, extensive public offices, prisons, and a postal service, both in working order, and a good-sized market place. Two years ago it was a perfect wilderness, inhabited by ostriches and wild goats. Now, the balls given during the winter season call forth a display of diamonds, costumes, and lace, such as it would be hard to surpass in Europe. The only difference is that orchestral bands are here unknown, their place being supplied by two or three stringed instruments and a piano. The police is capitally organized under the command of an Englishman, an ex-cavalry officer.

The particular diamond mines which have given birth to this town are those of Colesberg, situated a short distance off. They are divided into about 3,000 claims, which have been worked to an average depth of 100 feet. The mine thus presents the appearance of an immense crater, studded with innumerable excavations. Amid the noise of creaking pulleys, revolving ropes, and trucks everlastingly in motion, 12,000 men are daily hard at work. Some of the sections have been abandoned, but the greater part yield good returns, although since 1872 the price of diamonds has decidedly gone down in the market, owing to the large "finds" which have been made.

FROM an Archangel correspondent of the Russian *Golos* it appears that, during the ensuing summer, it is in contemplation to despatch two scientific expeditions, one to the Keme district and to Russian Lapland with the object of making a study of the geology of the region and examining the traces of ancient glaciers, and the other to the shores of the White Sea, for the purpose of making zoological researches. Much interest attaches to these operations, for Dr. Yarkinsky, who for the last two years has been at work in these parts, has discovered a great many specimens of fish and crustacea of an entirely new character.

WE learn from the *States* that the United States steamer *Tuscarora*, Commander Belknap, engaged in taking deep-sea soundings, left Honolulu March 18, and arrived at Yokohama, Japan, April 27, having made seventy-two casts, the deepest of which was 3,287 fathoms. She will now examine the southern coast of Japan, from which she will carry a line of soundings to Touoga, Aleutian Islands, and thence complete the arc of the great circle to the point reached last autumn from Puget Sound.

PETERMANN'S *Mittheilungen* give an interesting table by E. Dierke, of Berlin, of all the colleges, schools, and normal training institutions in the German Empire. From this it appears that 109,495 teachers are required for the instruction of the entire number of children capable of attending school, and consequently that provision has to be made annually for the training of about 4,500 schoolmasters to supply the ordinary average loss by death, withdrawal, and other causes.

THE *Revue des Deux Mondes* contains an interesting paper, entitled "Le Tonkin et les Relations Commerciales," which, we imagine, is intended to be, in some sort, an apology for the line of action recently pursued by the French in that remote part of the Indo-Chinese peninsula, about which, unfortunately, we possess so little trustworthy information, and we think that some of the assertions put forward must be received with a certain amount of caution. After some introductory observations respecting the expedition which, at the request of the Annamite Government, was sent to Tonkin last October, under the command of the ill-fated Lieut. Francis Garnier, the writer divides his paper into two distinct parts, in the former of which he relates how one M. Dupuis made his way through Tonkin by the Red River and its affluents to the Chinese province of

Yunnan, and how a few months ago the commander of the *Bourayne* war-steamer explored the seacoast of this country, and delivered it from the pirates who had so long infested it, and who had for four months actually kept the ports in a state of blockade. M. Dupuis, we should mention, originally started from Hongkong at the end of October, 1872, with the ostensible purpose of conveying through Tonkinese territory a cargo of munitions of war, including chassepots and revolvers, to the Chinese General Ma, who was then engaged in operations against the Mahometan rebels in Yunnan. After encountering considerable difficulties and delays, M. Dupuis reached his destination in the spring of last year, and was well received by Ma, who congratulated him on having been the first to accomplish so hazardous a journey. On his return the Chinese General gave him an escort of 150 *braves* (i.e., soldiers), with whom, after having sent his companion back to Hongkong, M. Dupuis took up his quarters at the chief town of Tonkin, "afin d'y ouvrir un comptoir et de poser les premières bases du traité de navigation," which was also one of the objects of poor M. Garnier's mission. The complications arising from this course of action on the part of this somewhat curious diplomatic agent (who, as we happen to know, has usually carried on a very humble mercantile business at Hankow, in China), gave rise to the active interference of the French naval authorities in Tonkinese affairs, the immediate result of which has been the signature of a treaty of commerce, but with regard to what is to follow eventually, it would be premature to hazard a guess. The writer in the *Revue des Deux Mondes*, in speaking of M. Dupuis' journey through Tonkin, takes occasion to allude to our repeated and hitherto ineffectual efforts to open a commercial route between the north-east provinces of India and south-western China, and he maintains that if the Song-koi or Red River be opened to European commerce, no other route will be able to compete with that through Tonkin, which M. Dupuis has so successfully explored. In the second portion of his paper the writer gives, at some length, interesting details respecting Tonkin and its resources, from which we gather that it abounds in the precious metals, as well as copper, iron, zinc, &c., that it is well off in the matter of vegetable products, and that the inhabitants are remarkable for the pureness of their Mongol type, though they differ somewhat in appearance from their neighbours the Chinese. Hurricanes and typhoons, tigers and other wild beasts, fevers and dysentery, are the chief, and, we must own, rather serious, drawbacks to a residence in this country, which may not impossibly become of great importance to the commercial world at no very distant date, if Captain Sprye's proposed caravan route to Yunnan should prove a failure.

THE CHEVALIER DE GRAMONT AND LA BELLE HAMILTON.

IN an introduction to Count Antony Hamilton's *Memoirs of the Chevalier de Gramont* it is told how the Chevalier made love to Elizabeth Hamilton, and how, when about to quit England, he was overtaken at Dover by the lady's brothers, who asked the Chevalier whether he had not forgotten something in London, and received the reply: "O yes, I have forgotten to marry your sister." (The *Memoirs* themselves do not contain this story). But however flighty the Chevalier may have been, the friends of the lady took care that a proper provision was made for her; and it will be seen that the Chevalier (then about forty years old) was, as might be expected, liberal in the way of settlement. A few days ago the original settlement made on the marriage was sold in London by public auction. I am not aware that the document has been hitherto noticed, and therefore send you an epitome of the contents, which are in three skins of parchment, signed by the Chevalier. His autograph is of great rarity.

The Duc de Gramont has just printed for private circulation a few copies of a History of the House of Gramont; but I am not aware if the settlement is there alluded to.

The settlement is in English, and is stated to be made in the City of London, November 9, 1663, between the Right Honourable Philibert de Gramont (*sic*), commonly known and called by the name of the Chevalier de Gramont, second son of the late Duke de Gramont, deceased, and second brother and heir presumptive and apparent of the Right Honourable Henry de Gramont, Earl or Count of Toulonjou, in the province of Bearne, in the kingdom of France, by their mother Claude de Momorencie Duchess de Gramont, second wife of the said late Duke de Gramont, of the one part; and the Right Noble James Duke of Ormond, maternal uncle of Elizabeth Hamilton, daughter of the Right Honourable Sir George Hamilton, of Greensow, in the county of Londonderry, in the province of Ulster, in the kingdom of Ireland, knight, and the Right Honourable James Hamilton, Earl of Abercorn, eldest brother of the said Sir George, and paternal uncle of the said Elizabeth, of the second part. In consideration of a marriage to be had between the Chevalier and Elizabeth Hamilton on the following morning according to the rites of the Holy Catholic and Apostolic Church, and of 13,076*l.* 18*s.* 5*d.* paid to the Chevalier by the said Sir George Hamilton, the Chevalier agrees that one third of the 13,076*l.* 18*s.* 5*d.* being (at 13 livres Tournois for every pound sterling) 170,000 livres Tournois, and also the sum of 9,000*l.* sterling, the property of the Chevalier, and all other the personal estate of the Chevalier, should during the joint lives of himself and Elizabeth and the life of the survivor be in community between them, and governed by the custom of the City of Paris, although they might happen to reside elsewhere than in Paris. This provision was to be in bar of any claim by Elizabeth to or out of any estates or offices of the Chevalier's elder brother, the Count, which might descend to the Chevalier. The other two third parts of the said marriage portion were to be at the sole disposition of the said Elizabeth, notwithstanding the marriage, and she was to be at liberty during her life to renounce and disclaim the community before agreed on, and thereupon she should become solely entitled to the whole of that 13,076*l.* 18*s.* 5*d.* And it was also agreed that she should be entitled solely and apart from the Chevalier to all real and personal estate which during the marriage or afterwards should by any means come to her. The survivor of the two was to be at liberty to take at a valuation (specified in the inventory) to the extent of 20,000 livres Tournois, or 20,000 livres in ready money, any of the goods put in community. Neither of them was to be answerable for the debts of the other contracted before the marriage. The Chevalier then assigns to the Duke of Ormond and Earl of Abercorn the [yearly] sum of 15,000 livres Tournois out of the estates of his brother, the Count, if the reversion of them shall fall to him, and out of all his (the Chevalier's) real and personal estate present and future, so that Elizabeth is to have the 15,000 livres yearly after the death of the Chevalier, but only on condition that she renounces the benefits thereinbefore provided for her. The Chevalier covenants that his brother, the Count, is unmarried and has no lawful issue, male or female, and is seised of the viscounties, seignories, lordships, and manors of Aste, Seurac, and other places in the province of Bearne, and that they will descend to him (the Chevalier) if he should survive his said brother; and that his said brother was then possessed of the Seneschalship or Government of Begorre, in the province of Bearne, and was the King of France's Lord Lieutenant-General and General-Governor of the kingdom of Navarre, and that the said seignories, places, charges, and employments were of the average yearly value of 5,000*l.*, and that the Chevalier would not do anything to prevent the same from

descending to him, and that he, the Chevalier, was then possessed of ready money, goods, and chattels, to the value of 120,000 livres Tournois. The Chevalier then enters into what, in modern phrase, are called covenants for title and for further assurance. And lastly it is declared that the document was to be construed most favourably for the said Elizabeth Hamilton. The deed is signed by the Chevalier, *Philibert de gramont*. The seal of arms is gone.

With the settlement is a receipt on parchment, signed by the Chevalier, for the said sum of 18,000*l.* 18*s.* 5*d.*

Both documents are attested by Moskry (Muskerry?), Milo Power, and Nich. Armorer.

This settlement was in 1705 produced in evidence for some purpose in France, as appears by the following note in the margin of the third skin: "Paraphé le quinz^e jour de juin mil sept cent cinq, suivant notre procès verbal." (Signed) *Le Camus, A. Herbert*. And the like note is on the receipt. A. J. HORWOOD.

WOMEN'S RIGHTS IN THE LAST CENTURY.

In turning through some files of old newspapers, we have been surprised to notice that the question as to the propriety of women taking a more prominent part in public affairs was quite as diligently discussed a century ago as it is now-a-days. A few extracts which we have made will furnish somewhat curious illustrations of this. The *Morning Post* of April 14, 1780, contains the following announcement:—

"Casino, no. 43 Great Marlborough Street, this evening, the 14th inst., will commence the First Sessions of the FEMALE PARLIAMENT. The Debate to be carried on by Ladies only, and a Lady to preside in the chair. Question—Is that assertion of Mr. Pope's founded in justice, which says 'Every woman is at heart a rake?' On the Sunday evening a theological question to be discussed."

In succeeding issues of the paper, formal reports of the proceedings of this parliament in petticoats are published, such as:—Friday, April 21. The Speaker having taken the chair, it was resolved *nem. con.* that the assertion of Mr. Pope's, which says, 'Every woman is at heart a rake' is not founded in justice. A member presented to the House several petitions from men milliners, men mantua makers, &c., &c., against a bill entitled 'An Act to prevent men from monopolising women's professions.' Resolved that said bill and said petitions be considered."

"Such is the universal rage for public speaking," writes the *Morning Post*, of May 20, 1780, "that the Honourable Mrs. L——, possessed of no less than two thousand pounds a year, constantly speaks at the Casino Rooms on the nights of the ladies' debates."

In the *Morning Post* of March 9, 1781, we meet with this report:—"La Belle Assemblée—Budget. The opening of the Budget, and the debate which ensued upon the taxes that were proposed by the female Premier, as the Ways and Means for procuring the supplies for the present year, afforded such high and uncommon amusement to the numerous and splendid company in the Rooms, that a general request was made that on the subsequent Friday the Ladies should resume the consideration of the Budget, in preference to the question given out from the chair. In obedience, therefore, to the desire of the public, the Ladies mean this evening to resume the debate on the following taxes, viz.:—

1. Old maids and bachelors over a certain age.
2. On men milliners, men mantua makers, men marriage brokers.
3. On female foxes, female dragoons, female playwrights, and females of all descriptions who usurp the occupations of the men.
4. On monkies, lap-dogs, butterflies, parrots, and puppies, including those of the human species.

5. On made-up complexions.

6. On French dancers, French friseurs, French cooks, French milliners, and French fashion mongers.

7. On quacks and empirics, including those of the State, the Church, and the Bar, etc., etc."

About this time, too, we find the following ingenious problem propounded for the solution of a like gathering in "The Large Hall, Cornhill":—"Which is the happiest period of a man's life: when courting a wife, when married to a wife, or when burying a bad wife."

In 1788 an advertisement appears of the proposed opening, on March 17, of Rice's elegant rooms (late Hickford's), Brewer Street, Golden Square, for public debate by ladies only. The first subject suggested seems quite as comprehensive in the matter of women's rights as the most zealous advocate of them in our own day could desire. This is it: "Do not the extraordinary abilities of the ladies in the present age demand academical honours from the Universities, a right to vote at elections, and to be returned members of parliament?"

THE PALESTINE EXPLORATION FUND.

MR. BESANT sends us the following:—

The greater portion of the work connected with the Ordnance Survey of Palestine executed during the last two years has just been brought home by Lieutenant Conder, the officer in charge, and is now lying at the office of the Palestine Exploration Fund.

The staple of the work consists of the map, which is executed on the one-inch scale, and aims at being exhaustive, especially as regards the points of antiquarian and biblical interest. Every ancient road, aqueduct, and line of communication has been most minutely traced, and all ruins of whatever date, from the earliest Jewish and Canaanite remains, down to the latest Saracenic work of interest, have been visited, and are fixed *in situ*.

In addition to these sheets, which now include about half Palestine from Dan to Beersheba (3,000 square miles), two volumes of very detailed notes, made on the spot and daily transcribed, furnishing exact information as to all that is visible above the present surface, have been prepared, to which geological and other observations are added.

But perhaps the most valuable part of the collection is the series of special surveys and large-scale plans of all buildings of interest yet come across by the party; there are from seventy to eighty of these, being all of places either entirely unknown, or at all events never previously examined with sufficient attention; they include every kind of architectural detail likely to be of service in the comparison of the various examples.

Among the most interesting of these may be noted the exploration of Caesarea Palestina, where the Temple of Herod was discovered almost beneath the remains of the Crusaders' Cathedral, with the great aqueducts which brought water from the Crocodile River Zerka, and from the hill springs; while on the south of the town the ruined amphitheatre described by Josephus was examined and planned. Not far north, in the wildest part of Carmel, the ruins of a Roman town, previously unknown, were discovered—foundations and bases of columns—a site requiring examination and excavation. Again, in the hills west of Samaria a small town was discovered which is not even marked on the best map. The stones of its buildings are some of them ten feet long, and there is a public edifice, the foundations alone remaining, of fine masonry, but differing essentially from the usual plan of either a church or a temple, and yet evidently intended for some religious purpose.

The intricate windings of the traditional Cave of Adullam have been followed out to the end. The summer palace of Herod at S. Fureidès was visited and planned, and Joshua's tomb at Tibneh,

with its two hundred lamp-niches, was explored. Near Nazareth another site of much importance, belonging to the later period of Greek influence in Palestine, was for the first time described, but has not as yet been identified. To these we may add no fewer than seven new churches not explored by the Comte du Vogué, and a still larger number of early Christian monasteries, some with curious frescoes, and principally new discoveries.

The value of the work beyond its intrinsic worth lies in the fact that it furnishes an exact basis for further exhaustive labours; the officer in charge will be able to say decidedly what points would be likely to furnish interesting results, and what would not repay the labour of excavation. The final result of the works of the Fund will thus be an exhaustive account of all that is of interest in Palestine.

In addition to the maps and plans is an extremely interesting collection of water-colour sketches by Lieutenant Conder, illustrating places, manners and customs, natural history, &c.

CORRESPONDENCE.

DR. SCHLIEMANN'S DISCOVERIES.

Queen's College, Oxford: May 25, 1874.

The eloquent review in the *Quarterly* of Dr. Schliemann's discoveries at Troy has induced me to return to this subject, and to M. Lenormant's highly interesting and suggestive letters to the ACADEMY. The *Quarterly* reviewer has fallen into a curious misconception upon one point. He

believes that the Trojan explorations will demolish the current theory of three successive ages—of stone, bronze, and iron. Of course, however, it is plain that they can do nothing of the kind, since no archaeologist would pretend that each of the three ages has been everywhere contemporaneous; on the contrary, there are some races at the present day which are still in the stone age. What Dr. Schliemann's discoveries really prove is, that the earliest settlement at Hisarlik was much more civilised than the two which succeeded it, and that the site of the old hill-fortress was occupied by tribes each more barbarous than the other, and all more or less unacquainted with the metals. Demetrius of Skepsis states that the Troad was overrun by various Thracian tribes at different epochs; and we know from the evidence of classical authors that even in the era of Perikles, when Greek colonies were lining the coast of Thrace, there were still tribes in the interior whose weapons were of stone, and who built their pile dwellings in the lakes, like the Paeonians transported by Darius.

It is possible, that the race which immediately preceded the Greek inhabitants of Novum Ilium at Hisarlik, and lived in wooden huts, was that of the Kimmerians, whose appearance in Asia Minor is dated in the seventh century B.C. Herodotus (i. 15) assigns it to the reign of Ardys of Lydia, but the inscriptions of Assur-bani-pal describe two captive Kimmerian chiefs as being among the tribute sent by Gyges to the Assyrian monarch in 660 B.C. Shortly afterwards, Gyges broke off his relations with Assyria and sent help to Psammitikhus, king of Egypt, who had just revolted from the Assyrian yoke; in consequence of which, Assur-bani-pal tells us, the gods punished the Lydian king, by allowing the Gimirrai or Kimmerians to overrun Lydia and kill Gyges, who was succeeded by his son Ardys. The Kimmerians, however, must have penetrated into Asia Minor and destroyed the Milesian colony of Sinope only just before the tribute of Gyges was sent to Nineveh, since they are first met with on the monuments in the reign of Essar-Haddon (B.C. 681-669), in Khupusca, an Armenian district, under a chief called Teuspa, whose Persian name cannot fail to strike everyone. They had reached the eastern shores of the Euxine—though the Greek settlers there still surrounded them with an atmosphere of myth—at the time when *Odyssey* xi. 15-19 was written; and this as Kirchhoff has acutely pointed out, could not have been much before 660 B.C. The statement of Herodotus (iv. 11, 12; i. 103-106), therefore, that the Kimmerians had been driven from their seats on the Tyros or Inyester by the nomad Scyths, not very long before the first unsuccessful siege of Nineveh by Kyaxares, and during the reign of Psammitikhus, is fully confirmed. The occupation of the western part of Lydia by the invaders may accordingly be placed about 660 B.C., and this would very well agree with our being told by Strabo that Novum Ilium was founded in the time of the last Lydian dynasty, perhaps in the early days of Kroesus. It is more than probable that the Kimmerians were joined by some of the tribes of Kolchis and Pontus, whose territory they passed through. One of the most important of these were the Mossynoeki, or Moschi, called Meshech in the Old Testament, and Muscai in the Assyrian inscriptions. In the twelfth century B.C. they had been the leading people of Asia Minor; and Tiglath-Pileser I. (1130 B.C.) informs us that they had conquered Comagene and held under tribute for fifty years the countries of Alzi and Purukhuzzi (between the Upper Tigris and Euphrates), which had once been subject to Assyria. Almost the first act of his reign was to defeat their five kings and their army of 20,000 men, and then to plunder their cities, from which he brought back, among other things, vessels of bronze and iron. The latter metal must here been long known to the inhabitants of this region.

The Khalybes were famous for their working in iron and steel, and M. Lenormant has shown that the mountainous district to the south-west of the Caspian was the cradle of the "Turanian" race, "the mountain of the world," or "of the East," to which the Accadian (and Finnish) mythology looked back, and on which the ark of the Chaldean Noah rested. Philology proves that iron was known to the ancestors of the Finns and the Accadians before their separation, and the Tubal or Tibareni, who are always named in association with the Moschi, remind us of Tubal-Cain, the eponyme of the metallurgists in Genesis. Now it is clear that the successive inhabitants of Troy, who were all equally unacquainted with iron, can have had nothing to do with the great metal-working nations east of the Halys. If M. Lenormant is right in thinking that Tiglath-Pileser I. crossed that river, and even penetrated as far as Mysia, all the remains found by Dr. Schliemann must be anterior to the twelfth century B.C. For my own part, however, I cannot follow the learned French scholar in this part of his argument; the Assyrian king seems to me never to have been west of the Halys; and as late as the reign of Assur-bani-pal the name of Lydia is said to have been heard at Nineveh for the first time. Up to this time I believe that the Troad must have remained unaffected by the populations of the eastern part of Asia Minor. The sole fact in favour of a connexion between them is that among the kings of Comagene defeated by Tiglath-Pileser I. were Sadi-antenu and Cili-antenu, the son of Cali-antenu, names which recall *Sadyattes* and such words as *Skamander*, *Maecander*, *Kassander*. This, however, need not imply anything more than a common linguistic origin at some remote era, and it is noteworthy that the Medo-Elamite inscriptions of Mal-Amir—written in a dialect closely resembling that of the modern Finnic tribes—mention a god *Teru* or *Anteru*. I am therefore inclined to see in the Kimmerian inroad the first movement from Pontus to Mysia within the period disclosed by Dr. Schliemann's excavations; and it is a curious fact that, while the stratum of buildings which I have supposed to belong to the Kimmerians and the mixed tribes who had joined them is wholly of wood, the Mossynoeki are said to have constructed their houses and fortifications of the same material, and to have derived their name from a word *μῶσσον*, which signified "a wooden tower" in their language (see Dion, Hal. i. 26; Strabo, 549). They also wore helmets of wood, according to Herodotus (vii. 78, where they are distinguished from their neighbours the Moschi); and the account given by Xenophon (*Anab.* v. 4, 26) of one of their hill-fortresses is an exact description of Hisarlik.

If, then, the immediate predecessors of the Greeks of Novum Ilium may be considered to be Kimmerians and Mossynoeki, their predecessors again would have been one of the numerous Thracian tribes which found their way across the Hellespont. Among their remains, fragments of musical instruments in stone and ivory have been met with; and it is a singular coincidence that the legends of Greece ascribed the rise of poetry and the first poets to Thrace. Here were localised the myths of *Thamyris*, of *Museus*, and of *Orpheus*, and *Pieria* itself, though strictly speaking in Thessaly, might roughly be described as a part of Thrace. The existence of stone lyres shows that the "Trojans" manufactured their own musical instruments, and the ivory lyre would thus have been of home make. The importance of this fact is very great. As M. Lenormant remarks, none of the objects found show any trace of Egyptian, or even Phoenician, influence; but the ivory must have come from the East, and testifies accordingly not only to foreign commerce, but also to intercourse with a nation which traded with Eastern Asia. The large quantity of bronze and copper, which was probably brought from Kyprus, points in the same direction. Now here we are met by the fact

which I endeavoured to establish in my previous letter on palaeographic evidence alone. On the one hand, the Trojan pottery is altogether non-Phoenician, and so belongs to an age far earlier than that of Mykenae; on the other hand, commercial intercourse was carried on not only with Kyprus, but also with distant parts of the civilised continent. A comparison of the characters found in the Trojan inscriptions with those of the Kypric syllabary and the Hamath hieroglyphs seems to show that long before the rise of Sidon and Tyre Northern Syria was playing its part in the ancient world, inventing a system of writing, and carrying trade and letters to the shores and islands of the Mediterranean. And this is borne out by the glimpses of early history which we derive from the monuments of Babylonia. One of the imperial titles assumed by the primitive Chaldean monarchs is that of "king of the four races" of Syria (comp. Gen. x. 23), as though the possession of this country was one much coveted; Haran took its name from an Accadian word meaning "the road," implying that here lay the highway of commerce and culture, while its early supremacy is denoted by the fact that Sargon speaks of the "ancient laws of Assur and Haran," and that the planet Mercury is called "the prince of the men of Kharran" in reference, apparently, to their astrological lore; the old astrological tablets speak of the king of 'Subarti, or Syria, conquering Dilmun, on the Persian Gulf; and the Calendar—the most valuable of acquisitions to the civilised man—was first of all borrowed by the Aramaeans from the Accadians, and then handed on to the Assyrians, and through them to the Jews. The powerful kingdom of the Hittites contended long and successfully with the Egyptian empire; and the mercantile precedence of Syria may perhaps explain how it is that the Greek names of the letters of the Phoenician alphabet all end in -a, the emphatic *aleph*, the characteristic, not of Phoenician, but of Aramaic. The mediation of the Aramaeans would lead us to expect to discover traces of early Babylonian (not Assyrian) influence at Troy. The symbol of the cross, to which I alluded in a previous letter, may have been independently invented; but the tree of life, the horned animals, and the constellations remind us strongly of Assyrian carvings, which preserve the ancient Babylonian type. The *Quarterly* reviewer suggests that the mysterious disks might have been used for ornamentation, like the terra-cotta cones found by Loftus at Warka; and I may mention that I have myself discovered an arrow-head-shaped ornament of stone in the rubbish between the lion-slab at Mykenae and the lintel upon which it rests, which I believe was once stuck into a plaster-wall, like the clay cones of Chaldaea.

My letter is already too long; but before concluding, I should like briefly to refer to the arguments drawn by M. Lenormant from the identifications proposed by Egyptologists of monumental and classical names. They seem to me far too questionable to be relied upon. The interchange in Egyptian of letters such as *t* and *d*, *l* and *r*, the want of vowels, and the possibility of finding geographical terms of similar sound all the world over, seem to me more than enough to explain the resemblances pointed out between *Iluna* or *Iruna* and *Ilion*, between the *Daanau* (whom M. Chabas would make the *Daunians*) and the *Danai*. Most of the fair-skinned tribes, in whom the present school of Egyptologists see Greeks and Italians, are, I believe, nations of Northern Africa, like their allies the *Lebu* and *Mashuash*. The *Shardaina*, which may just as well be read *Shaltaina*, and used to be read *Khairatana*, and identified with the *Kretans*, or the inhabitants of the *Orontes*, are now assumed to be *Sardinians*, and the name of the *Zanklaeans* is supposed to be found in the great *Harris papyrus*. The *Tursha* are set down to be the *Etruscans* (*Tyrrhenians*), in forgetfulness of the fact that

their proper name was Rasenna, and that their appearance southward of the Po was a comparatively late event; the Shekursha become the Siculi, *r* being read as *l*, and *sh* being unnoticed; and the mythical Pelasgi are discovered again in the "Pelesta of the mid sea." The most famous of these identifications is that of the "Akaiusha of the sea" (*yuma*) with the Akhaeans; but the final sibilant of the Egyptian word is unaccounted for, and since the name given to the sea they inhabited is borrowed from the Semitic of Palestine, it is more reasonable to suppose that the Akaiusha, like the Caphtorim, the Philistim, and other tribes settled in the Delta, belonged to the Semitic race. A better case might be made out for the inhabitants of the coast of Asia Minor; but here, unfortunately it is the modern and not the ancient names which are used for the purpose of identification; the Lykians, for example, being called Leku or Reku instead of Termilae. But the fatal objection to all these attempted identifications is, that the naval power supposed to be enjoyed by the Akhaeans at an early period, and their extensive naval alliances with Libyans, Sardinians, Etruscans, and others, have been so utterly forgotten as to leave not a single memorial in the ballads and epics which celebrated the former glories of the Akhaean race. The ingenious reference which M. Lenormant makes to the *thalassokratia* of Minos must, as it seems to me, be given up on account of the lateness and suspicious quasi-historical character of the legend. Moreover, it is ascribed to Krete, not to the Peloponnesus; and a genuine tradition of such a maritime supremacy should be sought for only in the Homeric poems.

A. H. SAYCE.

DR. R. MORRIS AND DR. WEYMOUTH.

May 25, 1874.

Dr. Weymouth, in his recently published *Answers to Questions on the English Language*, takes exceptions to certain statements in my *Historical Outlines of English Accidence*.

I should not have troubled you with these few remarks, were it not that Dr. Weymouth has fallen into some very grave blunders in his anxiety to show that I have gone astray.

First. Dr. Weymouth very boldly denies (p. 77), what most Teutonic philologists have made tolerably clear (at least to my dull comprehension), that *did* is a reduplicate perfect of *do*. He does not see that *do* must be compared with Sanskrit *dā*, to place; perfect *dadhāu*; but he compares it with the Gothic weak verb *taugan* (O. E. *tawian*, E. E. *tawen*), violating at the very outset Grimm's law. The verb *do* must have existed in Gothic; cf. *deds*, a deed. On p. 78 Dr. Weymouth commits the grave error of comparing Eng. *do* with the Sanskrit *dā*, to give, and Gr. *dw*. Mere tyros in philology know, however, that this is wrong—Sanskrit *da-dā-mi* = Gr. *dā-dō-mi*; while Sanskrit *da-dhā-mi* = Gr. *tī-thē-mi*. The Latin language had once a *dare* = *dhare*, to place, or make, cognate with Eng. *do*, cf. *cre-do* with Sanskrit *śrad-dadhā-mi*. (See Max Müller's *Lectures on the Science of Language*, Second Series, ed. 1864, p. 205).

Secondly. Dr. Weymouth says that the O.-E. *dyde* is a weak preterite, perfectly regular in its formation, from *do*, except that the vowel is modified by *umlaut*. There are two doubtful, if not wrong, points in this assertion: (1) If *dyde* were perfectly regular, it would have been *do-ede*, not *dyde*. According to Dr. Weymouth's classification of weak verbs (p. 79), it ought to be called a contracted verb.

The preterite of *do* is evidently not formed from the root *do*, but from the more primitive form *da*: hence it has passed through the following stages: (1) *daida*; (2) *dēda* (as in Old Saxon); (3) *dyde*; (4) *did*. The O. E. *fon* = *fangan*, to take; pret. *fēng*, pp. *fongen* (Goth. *fahan*, pret. *faiſah*) is exactly analogous to *do* and *did*. In this view be correct, and it is that generally held, the *y* or *i* of *did* is a weakening of an original diphthongal *ai*, and

is, therefore, not the *umlaut* change we see in *fax* and *vixen*, or *man* and *men*.

Thirdly. Dr. Weymouth declares (p. 78) that the *-d* or *-t* of the past tense of weak verbs is identical in origin with the *-d* or *-t* in the passive participle. As the analogue of *-d* or *-t* as a suffix of the past tense does not exist in Sanskrit, Greek, or Latin, this statement is, at the first blush, very unlikely.

Again, in Sanskrit we find the past participle passive is *-ta-s* (*s* = visarga). By Grimm's law this should correspond to *-th* in the Low German dialects. Consequently we find the suffix of the pas. part. is *-th* in Gothic. In English it is *-d* or *-t*, except in (un)-*cou-th* from *can*.

Fourthly. As Dr. Weymouth professes to write for young students, he ought not to make their knowledge hazy by the introduction of mere unsupported conjectures of his own about the origin of the suffix *d* or *t* as a sign of the past tense. (See *Questions*, p. 78.)

Fifthly. Dr. Weymouth is far too positive and dogmatic in his assertions when, in the face of all philologists, he says: "It cannot be admitted [?] by Dr. Weymouth] that *-de* or *-ed* = *did*."

A comparison of the plural preterites of weak verbs in Gothic with other Teutonic forms seems conclusive to me that *d* of the past tense = *did*.

Sixthly. Dr. Weymouth complains of my non-historical classification of weak contracted verbs. Of his own I cannot see that it is very scientific or historical.

(1.) What authority has he for the A.-Saxon p. participles *swēt* and *lett*? I have never met with them.

(2.) Why has he got *rid* in Class A, whereas, according to his own classification, its participle shows that it belongs as much to B as A?

(3.) Where is Dr. Weymouth's authority for A.-S. *hreddan*, to *rid*. Its ordinary meaning is to take; but A.-S. *āhreddan* of course does mean to *rid*; in Early and Middle English *ridden* = to *rid*.

(4.) The A.-S. *screadiġe* could not have been a contracted verb. Its very suffix ought to have shown Dr. Weymouth that it was an oversight, if nothing more, to put it in the same class as *set*.

(5.) Dr. Weymouth has (p. 80) confounded to *shut*, A.-S. *scytlan*, a weak verb, with to *shoot*, A.-S. *sceōtan*, a strong verb. The two forms are quite distinct in all the periods of the language.

(6.) Dr. Weymouth does not explain why verbs of Class D, being of foreign origin, are contracted.

(7.) Verbs of Class C (Dr. Weymouth's classification) are all given in my Grammar, and are treated historically.

(8.) The contract verbs are arranged historically, and, I hope, scientifically, in the Appendix to my *Accidence*, pp. 308-313.

Seventhly. (1.) Dr. Weymouth accuses me of not noticing that pure English adjectives sometimes take plural *s*. I have not met with them, and therefore have not spoken of them. The only instance given by Dr. Weymouth is Chaucer's *hoppeteres*. As this is a word of entirely doubtful origin, the less said about it the better for young students.

(2.) Again, I am accused of not showing that adjectives in E. E. only take *s* when they follow the noun. Chaucer is an authority for E. E., according to Dr. Weymouth's classification of the periods of the language, and yet he has "*capitalles lettres*" (*Astrolabe*, ed. Skeat, p. 16). In 1340, we find the adjective in *s* put before the noun in "*principals* doles" (*Ayenbite*, p. 17: ed. E. Eng. Text Soc.). My statement, therefore, on p. 104 of my *Accidence* is guardedly worded.

(3.) I understand Dr. Weymouth to say that I have failed to give, as he has done, examples of an adjective used predicatively in *-s*. If he will turn to my *Accidence*, § 106, p. 105, he will find the very passage he quotes in his *Answers*, p. 87. I have done more than this: I have shown that in 1340, N. Fr. adjectives took a plural *s* when no substantive followed (see *Accidence*, p. 106).

Dr. Weymouth complains (p. 52) of the inaccuracy of those who derive *weight* from *weigh*, &c., "as though the words were formed in the modern stage of the language." Yet on p. 50 he says *weft* and *woof* come from *weave*. Some statements of the doctor's are very questionable:—

(1.) That *ditch* comes from *dig* through *dike*; *dike* and *ditch* are merely variants of the O. E. *dic*.

(2.) That *road* comes from *ride*. The general doctrine of Teutonic philologists is that the *i* in *ride* is a weakening of an original *a*: cf. *bind* and *bound* (O. E. *band*).

(3.) That *doom* comes from *deem*; the very reverse is the truth, for *deem* is to give a *doom*.

(4.) Dr. Weymouth has certainly not clearly explained *thought* from *think*. He ought to have shown his students that the *n* (as in *bring*, *gang*, *stand*) is non-radical.

(5.) *Many*, in "a great many," may be the O. Fr. *maisee*, E. E. *meine*, *maine*, which we have in *menial*. It is, more probably, the A.-S. *maenigeo*, *manegu*, a multitude.

(6.) Dr. Weymouth explains *aware* as *on ware*, on guard. I believe the phrase *on ware* (= with caution) does occur in O. E. writers, but the historical evidence, as Mr. Skeat says, in the *Journal of Philology*, v., p. 42, is distinctly in favour of *aware* coming from O. E. (or A.-S.) *ge-wær*, through M. E. *i-war*, *y-war*.

(7.) Can *grateful* (p. 14) be a word of "purely English origin"?

(8.) Are *king* and *queen* (p. 27) of different roots?

Lastly. Of Dr. Weymouth's peculiar notions about Early English pronunciation, I will not now say anything, but am content to let them be dealt with by Mr. Ellis.

RICHARD MORRIS.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, May 30,	1 p.m.	Sale at Christie's of the Collection of Pictures of the late J. Eden, Esq.
	2 p.m.	Third Floral Hall Concert.
	3 p.m.	Royal Institution: Mr. R. A. Proctor on "The Planetary System."
MONDAY, June 1,		" Crystal Palace Third Summer Concert (Raudigger's <i>Fridolin</i>).
	1 p.m.	Geographical: Anniversary.
	2 p.m.	Royal Institution: General Monthly Meeting.
	3 p.m.	Mr. Oberthur's Concert (Hanover Square Rooms).
	7 p.m.	Entomological.
	8 p.m.	Social Science Association: Professor Leone Levi on "Imprisonment for Debt."
TUESDAY, June 2,		" British Architects,
		" Fifth Philharmonic Concert (St. James's Hall).
	8.30 p.m.	Geographical: Dr. W. B. Carpenter on "Further Enquiries on Oceanic Circulation."
	3 p.m.	Royal Institution: Dr. W. H. Stone on "The Theory of Stringed Musical Instruments."
WEDNESDAY, June 3,	7 p.m.	Sculptors of England: Anniversary.
	8 p.m.	Anthropological.
	8.30 p.m.	Society of Biblical Archaeology: Zoological.
THURSDAY, June 4,	1 p.m.	Horticultural.
	8 p.m.	Microscopical. Obstetrical.
	3 p.m.	Royal Institution: Professor Story Maskelyne on "Physical Symmetry in Crystals."
FRIDAY, June 5,	6 p.m.	Royal Society Club.
	8 p.m.	Society of Arts: Mr. George Browning on "The Art Treasures of Italy."
	8.30 p.m.	Chemical. Linnean.
	3 p.m.	Antiquaries: Election of Fellows.
	3 p.m.	Hallé's Fifth Recital (St. James's Hall).
	4 p.m.	Archaeological Institute.
	8 p.m.	Philological: Mr. Brandreth on "Some Sources of Mythology."
	9 p.m.	Geologists' Association.
		Royal Institution: Professor Burdon Sanderson on "Venus's Fly-trap (<i>Dionaea muscipula</i>)."

SCIENCE.

A Treatise on Human Nature, being an attempt to introduce the Experimental Method of Reasoning into Moral Subjects, and Dialogues concerning Religion. By David Hume. Edited, with Preliminary Dissertations and Notes, by T. H. Green and T. H. Grose. In Two Volumes. (London: Longmans & Co., 1874.)

THE seasonableness of this new edition of Hume's philosophical works will scarcely be disputed; and it must be acknowledged that the labour of editing it has been most conscientiously performed by a thoroughly accomplished metaphysician; though we may regret that the work was not undertaken by a somewhat more sympathetic editor than Mr. Green. The aid which the latter furnishes towards the better comprehension of his author is contained almost entirely in two introductory essays of unequal length prefixed to the metaphysical and moral treatises respectively. The notes which he has added throughout the body of the work are, with very few exceptions, merely references to these introductions. No one, however, who reads Mr. Green's essays will accuse him of having performed his task in a careless or superficial manner. They represent a most laborious and exhaustive study of the writings not of Hume only, but of his English predecessors; they are written with great metaphysical ability, and in a style which has many literary excellences, and which, if somewhat difficult, is so chiefly because it gives in a very condensed form a mass of very close reasoning, and not from any want of coherence, clearness, or definiteness of statement. There can be no doubt, therefore, of the intrinsic merit of Mr. Green's work; though its different parts, considered as contributions to the history of philosophy, are, for reasons which I shall presently explain, of somewhat unequal value. And his critical discussion of English Empiricism as developed in Locke and Hume will have all the more interest for English readers, as being a really masterly application of a method of philosophy with which English readers are still comparatively unfamiliar. But whether this criticism is quite properly placed in an Introduction to Hume, is much more open to question. No doubt Mr. Green has conscientiously endeavoured, in the course of his argument, to give a connected exposition of the systems of Locke and Hume. But since he is at the same time still more concerned to refute them in a complete and effective manner: the result is that his criticism is likely to be more instructive to a student already familiar with the authors criticised, than to one who still needs to be "introduced" to them.

Mr. Green states very clearly at the outset his reasons for adopting this treatment of the subject. The point of view from which he writes is that of Kant's "new method of philosophy as elaborated by Hegel," which, as he afterwards says, reduces "psychology to metaphysics." He is, therefore, altogether hostile, not only to Hume, but to the manner of philosophising generally prevalent in England: which, (with whatever differences in specific doc-

trines), has always shown the contrary tendency to reduce metaphysics to psychology. He adopts, in fact, the view generally current in the German schools that have sprung from Kantism, that the sole function of English philosophy was to prepare the way for Kant; that when, through Hume, it had fulfilled the office of awaking the thinker of Königsberg from his "dogmatic slumber," its part in the world's history was played out; and that since that time, except in so far as it has received back illumination from Germany, it has been altogether unprogressive and unfruitful. Thus his chief concern with the philosophy of Locke and Hume is to show that their method, consistently developed, ends by proving impossible the very knowledge of which it professes to explain the origin and define the limits; so that the attempt of later empiricists to use Hume's principles constructively is foredoomed to inevitable failure. This is a polemical object of much interest and importance, but one somewhat difficult to combine satisfactorily with the expository function which Mr. Green ostensibly undertakes on the present occasion. He certainly endeavours to explain to the reader what Locke and Hume actually thought; but he is so much more anxious to exhibit the conclusions at which they ought logically to have arrived, that these latter are likely to get confused in the reader's mind with the real tenets of the philosophers. Nor, it must be added, has Mr. Green himself escaped this confusion; his critical aim has, in several cases, impaired his historical fidelity.

In this respect, as was before hinted, there is a great difference between different portions of his work. In that part of the introduction which is concerned with Hume's system, Mr. Green does give (along with his critical reduction of Hume to complete nescience) an exposition of the philosopher's own conclusions which is for the most part remarkably faithful and clear. But the first portion of his essay is occupied with an equally elaborate criticism of Locke; and here, in spite of the care with which Mr. Green has studied his author, and the scrupulous exactness with which he supports each point of his exposition by quotations and references, it somehow turns out that when we gather up the expository results of Mr. Green's 130 closely reasoned pages, most of the characteristic features of the historical Locke have disappeared. The striking difference between these two effects is partly due to the difference between the philosophies expounded. Hume is a comparatively coherent and harmonious thinker: he rarely forgets in one place what he has said in another—though he is sometimes not unwilling that his reader should but half remember it. Locke, on the other hand, is perhaps the most incoherent of all English metaphysicians, not even excepting Hamilton. He is both fundamentally and superficially incoherent; he maintains together positions really irreconcilable, and he continually commits himself to express contradictions: there is scarcely one of his technical terms which he does not use differently in different passages, and scarcely one of his classifications which does not involve cross-

divisions. Accordingly there is no writer whom it is more easy to misrepresent out of his own mouth; and that in the mere endeavour to make him consistent with himself. At the same time this very incoherence is greatly due to the perfect *naïveté* of Locke's manner of philosophising. He tells in such a plain unvarnished tale the results of his reflection on knowledge, that it would have been scarcely possible for Mr. Green and others to misunderstand his general drift as much as they have done, if they had not come with a definite preconception of what the founder of modern Empiricism must have said, fixed upon those parts of his statement which best answered to that idea, and attached to these an unwarrantable priority in importance over the rest of his narrative. It is quite legitimate, and may perhaps be useful, to point out in detail Locke's inconsistencies, and show to what paradoxical results certain of his premises logically lead; but to present these paradoxes as the actual tenets of the philosopher is surely to mix history and controversy in an unedifying manner. Partly, again, Mr. Green seems to have been misled by imperfectly conceiving Locke's philosophical antecedents. He describes him as having "gathered up the results of the empirical philosophy of Hobbes and Bacon." But, in fact, Locke owes nothing at all to Bacon; it is difficult to believe that he had even read the *Novum Organum*; and though he owes something to Hobbes, his connexion with Descartes is much more important. Every part of his system stands in direct relation to the Cartesian; sometimes, of course, the relation is that of antagonism, and naturally these points of controversy were especially prominent in the view of Locke and his contemporaries; but at this interval of time we can clearly see that he accepted the characteristic teaching of Descartes to perhaps as great an extent as he rejected it. There is, no doubt, one authority for which he has more reverence than for either Hobbes or Descartes, namely, Common Sense; but he seems to accept Descartes as the prophet of Common Sense, wherever the two are not patently at issue. With Descartes he holds that reflection establishes the distinct and equal reality of the separate entities, mind and matter; that "we have as clear ideas of spiritual substances, immaterial thinking beings as of bodily substances." Even the hypothetical Monism with which he afterwards qualifies this Dualism, allowing that the *substance*—as distinct from the *properties*—of mind may possibly be the same as the substance of matter, might be derived directly from Descartes' account of Substance. "We have no idea of substance," said that philosopher, "except that it is something in which exists some property or quality of which we have a real idea." "Very well," said Locke, "then why not one substance for the two sets of qualities?" From Descartes again he derives the *epistemological* position (if we may borrow a useful term of Ferrier's) which ultimately, though not by Locke, was found so incompatible with ontological Dualism: that each of us has immediate, intuitive knowledge of mental existence alone—of his own *être pensant*

and of its *pensées*; and that, as to other existences (1) God and (2) the material world, we can only attain certainty mediately, by processes of reasoning different in the different cases. So far we find the two thinkers in perfect accordance, though they differ, of course, as to the method of attaining this secondary certainty in each case. "If I doubt of all things," writes Locke, "that very doubt makes me perceive my own existence, and will not suffer me to doubt of that;" while again, "there can be nothing more certain than that the idea we receive from an external object is in our minds; this is intuitive knowledge." But the existence of God I know not immediately, but by demonstration; and my knowledge of the existence of external things is less certain than intuitive knowledge; it is, however, sufficiently trustworthy; it is "an assurance that deserves the name of knowledge." Thus Locke does not doubt, though he admits the possibility of doubting, the independent existence of the material world such as common sense, instructed by physical science, conceives it to exist apart from our consciousness; a world without colours, sounds, smells, &c., and composed ultimately of particles of matter whose size, shape, arrangement, &c., are unknown, but of which, as aggregated into larger masses, the "primary qualities" are faithfully represented in the world of our thoughts. Thus again, for all the controversy about innate ideas, Locke's view of the origin of knowledge is at least so far Cartesian that his empiricism has no affinity with the Sensationalism which was afterwards derived from it. What Locke is concerned to maintain about the origin of ideas is merely that an idea first occurs in mental experience on presentation of some individual thing or event of which it is the idea. Material things or events are, of course, presented to the mind by means of some motions of material particles first without and then within the percipient's body, "which, being continued to the brain, produce ideas in the mind." But Locke does not confound the material cause with the mental effect, nor does he enquire how the motions produce the ideas; he only knows that "God has annexed the latter to the former."

In all these points Mr. Green seems to have been led by Locke's carelessness of statement to mistake his real views. He attributes to him a fundamental confusion between physiology and psychology in his account of the origin of ideas; where he is really only guilty of looseness in his use of the word "sensation"—a looseness, it must be added, from which Mr. Green himself is not free, as he employs it to denote both a psychical fact (feeling) and a physical fact (motion of nerve-particles), and does not always make it clear which of the two he has in view. Again, he explains Locke's reluctance to call his "assurance" of the existence of the external world *knowledge*, by referring to his definition of knowledge as a "perception of agreement between ideas." But it is evident that Locke never saw that "real existence agreeing with any idea" was not a case of "agreement between ideas;" otherwise he could hardly have claimed "intuitive knowledge" of his own existence. Again, Mr. Green fathers on

Locke the doctrine of later empiricism—that what permanently exists is essentially unknowable—by a most complicated misapprehension: viz., by mistaking his view of substance, mistaking his view of real essence, and mistakenly identifying the two. For Locke's "Substance," as was before said, is that in a thing of which we have no idea except as a substratum for qualities to inhere in: it is, therefore, necessarily no further knowable than in this obscure and relative manner. "Real essence," on the other hand, is that quality of a thing from which its other qualities are derived: this in the case of material things is accidentally *unknown* to us, because our faculties are not acute enough to discern the size, shape, and arrangement of their ultimate parts: but it is not intrinsically *unknowable*. The primary *qualities* of matter have, Locke always holds, a permanent extra-mental existence, and are, *in kind*, faithfully represented by our ideas of them: but what particular modes of these primary qualities belong to the ultimate parts of any material thing we do not know.

It must, indeed, be allowed, that on none of these points is Locke's doctrine given in a clear and consistent form; and that his editor can always quote chapter and verse in support of his own interpretation. Indeed, one cannot but admire, as a mere display of logical strategy, the close, patient, and complete manner in which Mr. Green, arguing from premises which Locke has undoubtedly furnished, cuts off from him all retreat from ultra-phenomenalist conclusions. Only these premises are often mere inadvertencies which one feels sure Locke would have abandoned without the least hesitation. To take the most important instance of this. Mr. Green treats as a cardinal metaphysical doctrine of Locke's the statement that "relation is not contained in the real existence of things, but is something extraneous and superinduced" (B. ii. c. xxv. § 8). From this he quite legitimately infers that "all relation is a fiction of the mind;" that nothing really is related as we think it, but is only so thought by us; nothing, therefore, is really identical, really causing or caused, &c.: thus, no doubt, we are reduced to the momentary feeling as the sole reality. But that Locke has never dreamt of drawing this inference is sufficiently evident when we examine his treatment in detail of these relational ideas. The only one which he does regard as a "fiction of the mind"—and in some passages as an unnecessary fiction—is Substance; and this for special reasons as above explained. Our ideas of Cause and Effect, he distinctly states, are derived from observation of real causation: "Finding that . . . fluidity . . . is constantly produced by the application of a certain degree of heat . . . we call the single idea of heat in relation to fluidity the cause of it." Indeed so far is he from attaching to his distinction between "simple ideas" and "ideas of relation" the importance which Mr. Green attributes to it, that we find him tranquilly acknowledging (c. xxi., § 3) that "all our ideas, of what kind soever, when attentively considered, include in them some kind of relation."

In short, in so far as Mr. Green has aimed

at demonstrating Locke's inconsistency, his argument is overwhelmingly, but superfluously, effective; in so far as he has attempted the more delicate task of determining which of Locke's inconsistent positions were most important to their author, his work, however able and suggestive, is not satisfactory.

The case becomes different when, after a brief account of Berkeley, which we have not space to notice, Mr. Green passes to the main object of his Introduction. It is true that his aim here, as in the case of Locke, is to show that his author's method leads to the destruction of knowledge. But since this is, partly at least, Hume's own view of his results, the editor is here more in sympathy with his author, and therefore less liable to mistake his meaning. And in so far as Mr. Green is engaged in proving that the residuum of knowledge which Hume allows to stand is only left by a partial and inconsistent application of his principles, we find this mode of treatment more appropriate and interesting than it seemed to be when applied to Locke. For, in the first place, Hume's inconsistencies are not, like Locke's, manifest and flagrant. They are mostly latent, and only to be educed by the close and subtle analysis of his doctrine which Mr. Green employs. And, secondly, Hume's exposition has nothing of the *naïveté* of Locke's. Even in the first edition of his system (on which Mr. Green rightly concentrates his criticism), we find a reserve of statement and an artfulness of composition which conceal from the confiding student the full extent of the paradoxes persuasively instilled into him. At the outset, his account of the origin of ideas is made acceptable to an uncritical reader through a tacit assumption of the common-sense beliefs which it is ultimately used to overturn. For example, the distinction between "impressions of sensation," and "impressions of reflection," is maintained throughout; a distinction intelligible enough as long as we retain our natural beliefs in the permanent existence of mind and matter; but what its significance is to be when Hume has convinced us of the invalidity of these beliefs is never explained. And secondly, as Mr. Greene points out with much force, in Hume's exposition of his famous theory of Causation, there is really a double concealment from the reader of his destructive results. For first, after arguing that the belief in the causal connexion does not rest on a rational basis, but merely springs from a natural propensity, he still is prepared to "consider cause and effect as a philosophical relation," and to "fix general rules by which we may know when objects *really* are 'causes and effects to each other.'" And secondly, after explaining Belief generally to be merely the suggestion by a present impression of an idea more lively than an ordinary recollection, he still continues to discuss this particular belief as though the *representative* character of the idea thus suggested had not been eliminated by his explanation.

So long, however, as we are concerned with "matter-of-fact," the unbridged chasm between Reason and Common Sense to which Hume's reasoning conducts us is at least

partially avowed. But in order to exhibit more completely the destructive effect of his principles, it is necessary to pursue them into that department of knowledge which they seem not only to leave unassailed, but even to establish more securely on a thoroughly common-sense basis; the knowledge, that is, of the four kinds of relations between ideas which are "discoverable by intuition: resemblance, contrariety, degrees in quality, and proportions in quantity or number." Mathematics afford us the most conspicuous and interesting examples of this kind of knowledge; and accordingly one of the four parts of Hume's treatise is occupied with the discussion of spatial relations. Here it is not difficult to show that Hume's doctrine falls between two stools. In his effort to make his abstract ideas properly empirical he is forced to conclusions mathematically absurd; and yet he ultimately admits as legitimate, ideas which his general theory of the derivation of Ideas from Impressions ought to exclude. Take the general notion of Resemblance as he applies it. If we really have such an idea, it must be derived, according to Hume, from an impression of Resemblance. But all impressions are either "of sensation," in which case they are colours, sounds, &c., or "of reflection," in which case they are passions or emotions. If then an impression of sight is "found to be similar in the disposition of its parts" to an impression of touch, how are we to think of this similarity. It is not itself a sight or touch; therefore, on Hume's principles there can be "no idea" of it. Hume tries to meet this objection by saying that we can make a "distinction of reason" between figure and colour, though we cannot form a "distinct idea" of figure. Yet he afterwards speaks of a "distinct idea" of number (apart from things numbered); and this is not a momentary slip, as his whole doctrine of the real exactness of arithmetic, as contrasted with the inexactness of geometry, is based upon it. If we may in arithmetic and algebra "carry on a chain of reasoning to any degree of intricacy with perfect exactness and certainty," it is evident that we can frame and use effectively "distinct ideas" which are not copies of feelings.

So far Mr. Green's polemical exposition seems as cogent as it is careful. But in attacking Hume's account of our intuition of spatial relations, he falls into the mistake which we just noticed in his criticism on Locke. He puts prominently forward as Hume's doctrine on a fundamental point an inference from another opinion which (whether legitimate or not) Hume has certainly never thought of drawing. Hume's view of the matter of geometrical knowledge is sufficiently clear and definite. Space, as known to us, is always visible or tangible, an extended *visum* or *tactum*; each portion of it is composed of a certain finite number of ultimate parts, *minima*, *visibilia*, or *tangibilia*, which are really simple impressions of sight or touch, co-existing in a certain order. This order is what we mean by "pure space," as "distinguished by Reason" from the "impressions of sensation" (or their ideal copies) of which it is the order; though we cannot conceive it as separate from these latter. It is not difficult to show that

there are both metaphysical inconsistencies and mathematical absurdities involved in this development of Empiricism. But, unfortunately, in assailing it, Mr. Green attributes to Hume the doctrine that "all impressions are successive" in the sense that "no impressions are co-existent." Now it must be admitted that Hume would have a difficulty in explaining how impressions can be co-existent, if "Time is nothing but the different impressions and ideas succeeding each other," and "the parts of time are not co-existent." But this point should rather be pressed against his view of Time than of Space; as there is no doubt that he throughout holds that impressions may be co-existent; his arguments often expressly assert this, and more often necessarily imply it.

The same mistake impairs the value of Mr. Green's criticism on a still more important doctrine; that concerning Identity as an attribute of the object. Identity of the subject, as is well known, Hume roundly denies to be given in consciousness: "there is properly no simplicity in the mind at any one time, nor identity at different." But Identity in the object he admits as a valid notion, explaining it to be "invariableness and uninterruptedness of any object through a supposed variation of time." But of course if impressions are merely successive and never co-existent, this idea of identity is, as Mr. Green says, "on Hume's principles impossible." Accordingly, Mr. Green deals with Hume's argument as if he regarded identity in the object altogether a "fiction" for which he had to account by a "propensity to feign," resulting from habit. Whereas, Hume's point is, that the idea of identity, having been originally derived from experience of an impression that remains while other co-existing impressions vary, is then attributed to the object presented in two similar consciousnesses separated by an interval. Of the former kind of identity he would concede an immediate knowledge; it is only for the latter attribution that he finds, on reflection, no rational ground, since "the senses cannot inform us of the independent existence" of the object of sense.

One or two other minor misapprehensions might be noticed. But on the whole it must be allowed that Mr. Green has succeeded in his aim of unveiling the full destructiveness of Hume's metaphysical method, unsparingly, and yet without unfairness. Whether he is justified in inferring the futility of the attempts that have been made, since Hume's time, to build up a complete system of accredited knowledge on an empirical basis, I have not space to enquire. And of course, though Mr. Green's side-hits at Mill and his school are suggestive and interesting, it was not possible for him in a few allusions and digressions to deal adequately with the elaborate and carefully constructed arguments of modern Empiricism.

HENRY SIDGWICK.

Kleine altsächsische und altniederfränkische Grammatik. Von M. Heyne. (Paderborn, 1873.)

PROFESSOR HEYNE, who has already rendered excellent service to the older Low German literature and language by his *Laut- und*

Flexionslehre, his edition of the *Heliand*, and of the various fragments brought together in the *Kleinere altniederdeutsche Denkmäler*, has now come forward with a special grammar of the two closely allied dialects in which the *Heliand* has been preserved—Old Saxon and Old Low Frankish (*altniederfränkisch*). He also gives an account of the dialectical peculiarities of the texts published in the *Denkmäler*. The work is, therefore, practically a grammar to the *Heliand*; as Dr. Heine remarks:—

"Die Zusammenfassung beider Dialecte zu einer gemeinsamen Besprechung darf nicht so gedeutet werden, als ob dieselben in besonders hervorstechender Weise gegenüber den beiden andern (altfriesisch und angelsächsisch) gemeinsame Eigenheiten hätten, und so ihre Zusammenstellung herausforderten; sondern sie geschieht, weil von den wenigen Denkmälern beider Dialecte das umfangreichste in dem einen wie in dem andern Dialecte enthalten ist, und die gegenwärtige Arbeit namentlich das Verständniss dieses Denkmals fördern will."

The work consists mainly of details of spelling and inflexion, together with a few remarks on syntactical peculiarities, all of which show the accuracy and clearness which characterise Dr. Heyne's other grammars. There is, however, a painful want of any higher philological training, and the general character of the work is one-sided and exclusively antiquarian. Phonetics are nowhere, and Dr. Heyne appears to be entirely ignorant of the modern Low German languages, or, if he does know them, not to have turned them to any useful account. And yet it is certain that any one who approaches the study of the *Heliand* and the other Old Saxon and Frankish remains without a thorough knowledge of modern Dutch, is wilfully depriving himself of one of his most important aids. It would, perhaps, be too much to expect from a student of Old Friesian that he should make himself acquainted with the innumerable modern dialects; but there can be no excuse for ignorance of Dutch—a language which was in a state of high literary cultivation at a time when German, and, indeed, all the Teutonic languages, except English, were in a state of utter barbarism.

Many instances might be given of the errors into which German philologists have fallen through ignorance of the modern languages. The most curious is, perhaps, Dr. Heyne's identification of the old Friesian pronoun *jemma* (= "you") with the Vedic *yusmē*. The truth is that this *jemma* is nothing else than the English "ye men" written in one word, as is clearly proved by the form *jemman*, which Dr. Heyne describes as a "Verstümmelung"—on what grounds it is difficult to see. Now it may safely be said that no one acquainted with the Dutch forms of the second person plural, *jullie*, *jelui* = *jij lieden* (German *ihr Leute*), would ever have thought of any other explanation of these Friesian forms. A brilliant example of what may be done by a combination of a knowledge of the modern dialects with a scientific philological training is afforded by the investigations of Professor Kern, of Leiden, on the glosses in the *Lex Salica*, which have so long been a stumbling-block to Teutonic philologists. H. SWEET.

REFORM IN THE UNIVERSITY OF DUBLIN.

THE adjourned debate of the Senate was resumed on May 15 with great vigour. Some thirty pages of amendments had been sent in from various quarters, from working Fellows and Professors, from resident private teachers, from country gentlemen, and country parsons. It would be tedious and very profitless to our readers to enumerate these amendments, especially as the decision taken on two or three abstract principles swept them away wholesale. There was a large attendance each day of the debate hitherto, many old graduates, especially rectors of country parishes, coming up to air their eloquence and their opinions. Is it not, by the way, an anomaly in the Dublin Senate, that non-residents are allowed to remain members? There is no qualification of residence required, even residence in Dublin. A fee of 4*l.* 15*s.* entitles any M.A. to sit in the Senate for life. Hence the motley character, and very divergent views of this curious body.

The first amendment, however, was one distinct in principle from all the rest, and justly put first in order by the Registrar of the Board, to whom was apparently entrusted the task of grouping the amendments in some logical order. It was proposed by Mr. Butt, M.P., and was clearly of a denominational and ultramontane complexion. It proposed to postpone the whole consideration of the question, in order to consider by what arrangements a Catholic College might be attached to Trinity College. This was simply an attempt to reverse the policy of Mr. Fawcett's Bill, and enlarge the question before the Senate into the old nightmare about University Education in Ireland. Mooting as it did no mere amendment, but a complete reversal of the policy of the Board, it was at first doubted whether the Vice-Chancellor would receive it; but the wiser course was taken, and the advocates of a denominational College for Roman Catholics were allowed to say their say. In Mr. Butt's absence, it was supported by Dr. Haughton, Dr. Shaw, and by Mr. Galbraith (of Home Rule notoriety), in speeches able enough, and telling, had they been supporting a separate Catholic University, but not convincing as to an affiliated college. There was the usual high talk about religion in education, about the baneful effects of godless culture, about the wishes of the majority in Ireland; and there were indeed a good many members who sympathised with the wants and wishes of the Roman Catholics deeply enough, but to injure Trinity College for such a reason seemed to them too great a sacrifice. They listened patiently, and then, by a vote of 74 to 7, decided to reject Mr. Butt's amendment.

The question which next arose was upon the priority of several proposals, all of which had this feature, that instead of allowing the existing Board of Senior Fellows to continue side by side with the proposed Academic Council, they proposed to abolish or merge the Board in this new Council. The gentlemen who took this view objected to the present government; they regarded its continuance a mere drag upon the action of the new Council; they insinuated that things had hitherto been badly managed, and that a complete change was necessary. Dr. Stubbs, indeed, somewhat perplexed the issue, for while supporting the Radical party in favour of one governing body, he proposed to make this body a mere enlargement of the present Board, thus superseding the necessity of the new Council. But it became plain in the course of Monday evening, and still more on Tuesday morning before the Senate met, that the real issue was a vote of want of confidence in the Board of Senior Fellows. Those who proposed a single (new) governing body did so because they wished to turn out the old administration, while those who supported two bodies did so in order to preserve the powers of the Board, though supplementing its action by that of a new and vigorous Academic Council.

This broad issue gave great life and interest to the debate of Tuesday. The opponents of the

Board attacked not only the Board itself, but the whole Fellowship system; and two of them (Drs. Reichel and Griffin) asserted that the Dublin Fellows were elected on a narrow system of special examination, and had failed as practical teachers. On the other hand, Dr. Salmon lent his great authority to the Conservative side, and showed that the existing Government had acted wisely and liberally; that both in creating professorships, in founding prizes, and in building suitable laboratories, a vast deal had been done. On this point he and Dr. Haughton, who supported him in a most humorous speech, carried conviction to the Senate. Mr. Mahaffy, on the same side, retorted upon Dr. Reichel the analogy of the German universities, which had been cited to show how far wider and more effective a system without fellowships had proved than the monopoly of a corporation of Fellows. Mr. Mahaffy showed conclusively that such comparisons were absurd, owing to the different principles involved—that the German professors worked for miserable salaries, that they performed no tutorial duties, and conducted no properly collegiate education—above all, that great as was their learning, in culture and broadness of knowledge the Oxford, Cambridge, or Dublin Fellows were vastly superior. He showed that the fashionable worship of the German system in England and Ireland arose chiefly from ignorance, and that the great results there attained were in spite of an inferior system.

It became plain, long before the division, that the radical reformers were overmatched in the debate, and had no sufficient ground for their proposal. It was accordingly carried, by 74 to 15, that Trinity College should have two governing bodies—the existing Board of Provost and seven Senior Fellows, who are still trustees for property and administrators of the finance; and the new Council, of which both the formation and functions must now be determined.

The debate of Wednesday, after an abortive attempt of Mr. Minchin to shake the power of the Senior Fellows in the election of representatives for the Council, turned upon the all-important questions of the constitution of the Senate, and its powers of sending representatives to the new Council. It seemed admitted that the seven Senior Fellows should send four, the Junior Fellows four, the Professors (excluding Fellow Professors) four, and the Senate some; but should the whole Senate, including Fellows and Professors, vote; or should the residue alone vote, and should this residue have four representatives? Again, granting such power to the non-attached members of the Senate, it was urged by Dr. Traill and Mr. Barlow that the qualifications should be raised, that some collegiate distinction beyond the bare A.M. degree should be required to entitle a man to a voice in the election of the new Council. This latter question, however, was opposed as not being an amendment, but a substantive motion; and in a division as to its admissibility, 35 votes on each side were recorded, so that the Vice-Chancellor rejected it, though immediately after another vote (Professor Apjohn's) was handed in, which would have reversed the decision.

It was then discussed whether the whole Senate or the outsiders alone should vote for the representatives of the Senate. Though many Fellows opposed such a subdivision (for electing purposes), they thought it undignified to vote concerning their own power in the Senate, and the decision being left to the outsiders, and the few resident Masters not on the staff, they of course voted this power to themselves, by 29 to 11. It was then carried by Dr. Salmon, that voting papers should be used, and other details of the mode of election were discussed.

The result, therefore, so far is this: that the general scheme proposed by the Board will be carried, with a few unimportant modifications. It is feared that the outsiders will not be so Liberal as the working men of the university, and that

the chance of electing Roman Catholic members of Council for the Senate is diminished. But any general reflections must be postponed to our final review of the whole results. We need only add that the Fellows have triumphantly vindicated their position, and have completely routed their assailants in the debate.

NOTES AND NEWS.

WE hear that a meeting will be held at Bristol on June 11, to explain the details of a scheme for establishing in that city a College of Science and Literature for the West of England and South Wales. A novel feature in the proposed institution, which distinguishes it from similar schools already established in the chief industrial centres, is that two colleges of Oxford, Balliol and New College, are to contribute considerable sums to its support, and to co-operate in its management. It is hoped that thus an intimate connexion may in course of time be formed between our great towns and the universities.

THE numerous friends and admirers of the oyster will be glad to hear that the permanent "Exposition ostréicole," in connexion with the aquarium of the Scientific Society of Arcachon, will be inaugurated on July 26. The exhibition comprises all the apparatus used for breeding oysters, or models on a reduced scale, and statistical and scientific notices of all kinds relating to the oyster.

A NEW weekly journal, *The Sanitary Record*, a Journal of Public Health, to be published by Messrs. Smith, Elder, & Co., will shortly appear. It will deal with the hygiene of houses, schools, nurseries, hospitals, workshops, mines, &c. It will be under the editorship of Mr. Ernest Hart, assisted by a large staff, including Dr. Hardwicke, Dr. Whitmore, Dr. Meymott Tidy, Dr. Bond, of Gloucester; Mr. Eassie, C.E.; Mr. Robson, architect to the London School Board; Miss Octavia Hill; Mr. W. H. Michael, and most of the leading sanitary authorities in this country.

THE United States Commission for Fish and Fisheries has published the first Report of operations and inquiries in reference to the decrease of the food-fishes on the sea coast and in the lakes of the United States. It is a handsome volume of 852 pages on the Condition of the Sea Fisheries of the South Coast of New England in 1871 and 1872, by Spencer F. Baird, Commissioner, and is illustrated with forty-one plates. The results of the Commissioner's Report are summed up under thirteen heads, the two principal being (1) the alleged decrease in the number of food-fishes in these waters within the past few years has been fully substantiated; (2) the shore-fishes have been decreasing during the past twenty years, very rapidly since 1871. As the questions at issue are most nearly related to the scup (*Stenotomus argyrorops*) and the blue-fish (*Pomatomus saltatrix*), Mr. Baird has given as complete an account of their habits and peculiarities as he was able.

THE Buffalo Society of Natural Sciences have just published the fourth number of their Bulletin, which completes the first volume. One of the papers is on the Geology and Physical Geography of the Lower Amazonas, by Professor Hartt, but the subjects are chiefly entomological.

BEFORE the *Challenger* left Kerguelen, Captain Nares determined the south cape of the island and named it Cape Challenger.

AT the last meeting of the Royal Society on May 21, Dr. Tyndall exhibited his fireman's respirator, which is attached to a mask, and consists of an iron cylinder packed with cotton wool, glycerine, and charcoal. The wearer is enabled to remain in an atmosphere of smoke, which he could not otherwise breathe, for a quarter to half an hour. Dr. Tyndall has tried the respirator in a room prepared for him by Captain Shaw of the Metropolitan Fire Brigade.

THE members of the Woolhope Naturalists Club held their first field meeting at Church Stretton on the 15th inst. The day's proceedings included an ascent of the Oradoc Hill—one of the grandest portions of the Silurian upcast—a visit to All Stretton, crossing the well-defined Watling Street which gives its name to so many places in the district, and a ramble among the lower elevations of the Long Mynd Range. The protracted drought made the day one of much disappointment to the botanists of the party, who scarcely found adequate compensation in observing the effects of the late severe frosts on the vegetation. In many places the young shoots of the oak and ash were blackened and the blossom on the apple and pear trees destroyed—an amount of mischief for which it would be hard to find a parallel. At the afternoon meeting an interesting and probably unique specimen of Herefordshire pottery was exhibited. The place of manufacture was a remote part of Deerfold Forest, in the parish of Lingen, near which (in the Aymestry valley) some veins of white ceramic clay have been noticed. The works appear to have been carried on at the beginning of the last century for a few years only, but within the memory of man pots and dishes of Lingen ware might be found in many houses in the neighbourhood. The specimen exhibited (by the Rev. C. Middleton, of Malvern, late Vicar of Lingen) was a tea-bottle or caddy of cream-coloured body, partially coated with bright green glaze, and ornamented with a rude leaf pattern in low relief. The short time at the disposal of the members rendered it necessary to postpone the reading of several interesting papers.

A SOMEWHAT unusual proposition has been made by a German poet, Julius Hübner, who, in a poem addressed to the German nation at large, suggests that the constellation Cassiopeia should be formally and officially re-named "Wilhelm's Fame," as a national tribute of gratitude to the emperor. The German Astronomical Society declined to consider the suggestion, on the ground that their resolutions exclude the recognition of any constellation not laid down on Argelander's new *Uranometrical Atlas*. Herr Hübner's loyal attempt is not without scientific precedent, as Halley with questionable readiness allowed himself to be persuaded to incorporate "Charles's Oak" and a "Cor Caroli" in his celestial charts; while other astronomers, as Benmonier and Balaude, attempted by similar methods to secure immortality for the reindeer and the cat. The lamentable consequences that might result from too free an indulgence of such means of awarding immortal fame may be judged by the fact that Olbers, writing at the beginning of this century, was able to point out that the space required for doing celestial honour to the fame of Frederick the Great had only been obtained by displacing Andromeda's right arm from the place which it had occupied for more than 3,000 years.

PROFESSOR GEORGE FORBES, of Glasgow, has edited Rendu's *Théorie des Glaciers de la Savoie*—the original text, with a translation by Mr. Alfred Wills, Q.C., the well-known Alpine writer. Rendu's treatise is accompanied by a collection of *pièces justificatives* relating to the painful controversy on the subject of glacier-theory between Professor Tyndall and Principal Forbes, which, having lasted for several years during the latter's lifetime, was unfortunately not suffered to sleep at his death. Into the merits of this controversy we have no wish to enter, for there are few discussions less profitable than a *Prioritäts-streit* and the questions to which it gives rise. This is especially the case when one of the parties to the controversy is no longer able to fight his own battle. Nevertheless, the republication of Rendu's treatise is a matter of real interest, for the book has long been so rare as to be practically inaccessible, while its importance for the history of glacier-theory is incontestable. We should gladly notice it at greater length, but it would scarcely be possible to do so at present without taking part in the

strife which has caused its publication, and this we should be very reluctant to do.

Grave Mounds of the Starnberger Lake.—*Das Ausland* contains an account of the grave mounds and burial-places on the shores of the Starnberger Lake, in Bavaria, south-west of Munich. Professor Kollmann considers them not merely belonging to the Romano-Gaulish and post-Roman periods, but also to an old German population of various stocks and at a much earlier date.

The paper contains important remarks on the probable dates of brachycephalic and dolichocephalic types. The Bavarian mounds are said at present only to have yielded specimens of the former.

Chemical Action in Living Bodies.—In a lecture recently delivered by M. Ad. Wurtz before the Faculty of Medicine in Paris, reported in the *Revue Scientifique*, an account is given of the transformation of organic substances, and the chemical reactions in the animal economy. The following passage occurs, which, although not containing any fresh discovery, is an excellent *résumé* of what is at present known of the relations of chemistry to what are called vital processes. After observing that a series of animal products may be obtained by submitting albuminoid matter to the slow oxidising action of a mixture of bichromate of potash and dilute sulphuric acid, but that the exact interpretation of the changes that occur cannot be given, as the molecular constitution of albumen is still unknown, he adds: "Still more difficult is it to interpret the slow oxidation of albuminous materials in the animal economy, because, in addition to the difficulty just mentioned, the conditions of the reaction are still undiscovered. Thus, if we know the general nature of the chemical phenomena of dissimulation, we are ignorant of their modality. But we can affirm without fear that the forces exhibited in these operations do not differ from those belonging to pure chemistry. When an organic molecule is attacked by the processes of life, the relatively weak affinities which hold together its different atoms are obliged to yield to others which are more powerful. Overcome by the strong affinity of oxygen for carbon and for hydrogen, the molecular edifice crumbles and is destroyed by repeated attacks, the last products of oxidation being water, carbonic acid, and urea. All this conforms with what we observe outside the economy, and with the known laws of affinity which permit us to predict the action. As a decisive proof of this conformity, we may cite the disengagement of heat which accompanies phenomena of this description, whether they occur within the animal economy or outside it."

Influence of Light on Chlorophyll.—From experiments of Herr Julius Wiesner, of which an account is given in *Der Naturforscher*, it appears that the formation of chlorophyll goes on most quickly in highly refractive light rays. Etiolated shoots of *Trifolium pratense* began to exhibit a green tint in two hours when exposed to light passed through solution of ammoniacal sulphate of copper, the blue of which corresponds with rays from E to H in the spectrum. They became an intense green in this light, while scarcely any change occurred to similar plants exposed to the yellow light obtained by passing white light through a solution of bichromate of potash. This at first seemed inconsistent with the fact that the nutrition of plants, involving production and destruction of chlorophyll, and assimilation of carbonic acid and water, proceeds most vigorously in the brightest light, which includes the yellow rays and their neighbours. The chemical actions of light on chlorophyll are, however, complicated, and the green we see in growing plants is the balance that remains between the formative and destructive actions constantly going on. In many plants the formation of chlorophyll takes place when the light is so feeble as to make no impres-

sion on human sight, but a stronger light is required for its destruction. In a degree of darkness in which shoots of many mono- and dicotyledonous plants grow green, an alcoholic solution of chlorophyll suffers no change for weeks. The destruction of chlorophyll begins with an amount of light necessary for the decomposition of carbonic acid, and the two processes increase together as the light becomes more intense. Herr Wiesner confirms the results obtained by Sachs as to the effect of different coloured light upon chlorophyll. An alcoholic solution of it began to lose its colour in sunlight in 0.5 of an hour; in the yellow rays of direct sunlight passed through bichromate of potash, in 0.75 of an hour; in the blue light of the sun through ammoniacal sulphate of copper, in 4.75 hours. When, instead of direct sunlight, diffused daylight was used, the times were 3.5, 6, and 81 hours under the same conditions. In these experiments chlorophyll is treated as if it were one substance, whereas it is a mixture of colouring matters, each having its own properties.

Fossil Chelonians.—*Der Naturforscher* contains a paper of Herr L. Rutimeyer on Fossil Chelonians (tortoises, &c.), communicated to the Swiss Natural History Society, in which he speaks of the numerous gaps in the geological record of these creatures, which, he observes, without doubt lived in much earlier periods than that of the Upper Jura formations, the oldest in which they have hitherto been found. The greater part of those discovered appear not to have lived in the open sea, but on shores or in estuaries. Those with swimming feet first occur in the upper chalk, but those of the Jura and most of the chalk species were certainly not pelagic. No extremities of land tortoises have yet been found, but terrestrial species first appear in the Miocene period, and were contemporaneous in North America, Europe, and Asia, some being of gigantic dimensions. Nothing like a general advance of the group can be predicated, and palaeontology as yet affords no more explanation than existing species of the relations which so bizarre and isolated a type as the Chelonians bear to other reptilian groups.

CARDS have been issued by the President of the Geological Society and Mrs. Evans, for a conversazione to be held on Wednesday, June 17, in the Society's new apartments at Burlington House.

"AMONG the many services rendered by the decipherment of the ancient monuments of Egypt and Assyria," remarks Mr. Sayce in his preface to Mr. De Bunsen's *The Chronology of the Bible* (London: Longmans & Co.), "none perhaps is more important than the certain basis it has afforded for the restoration of the chronology of the past. . . . The Old Testament was for a long time the sole source from which a chronological system of early history could be extracted; and we now know how imperfect that source was. The last few years, however, have opened up unexpected stores of information. Much light has come from Egypt and still more from Assyria." Mr. De Bunsen claims to have shown that the Biblical chronology has been deliberately altered, as regards its two first periods, and that in one of these cases, the incorrect period can be safely replaced by the correct period. Thus he tries to show that 592 years, instead of 480 years, must be reckoned from the Exodus to the building of the temple; and ventures on the hypothesis that the incorrect and abbreviated period of 1,656 years between Adam and the Flood may be replaced by one of 8,225 years. The enlargement of the second period "permits us to regard as historical the entire Chronology referring to the time of the judges, and to show that the judgeship of Samuel lasted thirty-two years. Shishak's accession occurred during the reign of Solomon, as the Bible requires it; and the first expedition of the Assyrians to Judaea, in the time of Sargon, but

possibly under the leadership of his son and successor Sennacherib, . . . can be proved to have taken place, in absolute harmony with the Biblical statement, in the fourteenth year of Hezekiah, that is, in the year 711 B.C. . . . But the recorded destruction of Sennacherib's army refers to the second Assyrian campaign to the land of Judah in 701 B.C." Mr. Sayce has arrived at the same conclusion on this last point by a comparison of the cuneiform inscriptions with the Hebrew records. Mr. de Bunsen's earlier works will have prepared the reader to exercise a highly sceptical judgment. But no honest work can be in vain, and Mr. de Bunsen's researches will be suggestive and stimulating to many whom they fail to convince.

THE publishers of the "Theological and Philosophical Library" have made a most unfortunate selection of a volume to follow Ueberweg's *History of Philosophy*. Dr. van Oosterzee unites the qualifications of amiability and orthodoxy, but his *Christian Dogmatics* (London: Hodder & Stoughton) is at once too ponderous and commonplace to answer the purpose of a student's handbook. The tone is that of a mild Evangelicalism.

THE translation of Keil's *Jeremiah* (Edinburgh: T. & T. Clark) is now complete. The author holds no rank among critics, but produces accurate registers of facts and opinions. The work will so far be of great use to theological students.

THE eminent African scholar, Dr. W. H. I. Bleek, author of the *Comparative Grammar of the South African Languages*, sends us the following letter on the death of the Rev. J. W. Appleyard:—

"I have just heard with great regret of the death of the Rev. J. W. Appleyard on Saturday, the 4th instant, at 6 P.M. The letter giving me this sad news tells me also that the deceased was 'aged fifty-nine years and eight months. For some time,' it says, 'his health had failed, and, although we did not expect him ever to be able to work as he had done, we still hoped he would remain with us for a time. The day before he died he said he had neither doubt nor fear, and at last almost literally fell asleep.'

"What the Christian mission amongst the Kafirs loses by his death is neither in my power nor in my province to say. I can merely lament the great loss South African philology has hereby sustained. Twenty-four years ago Mr. Appleyard published a grammar of the Kafir language which as yet stands unrivalled among the grammars describing South African languages in its completeness, its accuracy, its careful and methodical arrangement, and its scholarly comprehensiveness. This grammar was to be succeeded by a Kafir-English dictionary; but only a few pages of it were printed when the manuscript was burnt in the Kafir war of 1850. Since then Mr. Appleyard has mainly devoted his time and strength to the revision of portions of the Bible already translated, and in translating such books as had not yet been translated. Different editions of the Bible in Kafir, published by him, have already appeared. This Bible edition has on several occasions been the subject of attack by other missionaries, and has thus been discussed in a very animated correspondence, in which Mr. Appleyard defended himself valiantly against numerous opponents. As in all such disputes, both parties were to a certain extent right. Mr. Appleyard had done his best; and for a first translation of the Bible into Kafir, his is a most creditable production. But, of course, he never claimed for it that exemption from faults or deficiencies which is not to be found in works by human hands. It is satisfactory to know that the final result of this dispute was the good practical solution of a joint commission for the revision of the Kafir Bible. Of the members of this commission, one who had been one of the foremost amongst his opponents, Tyo Soga, has preceded him to his rest some time ago.

"It is due to Mr. Appleyard to state that the objections made against his version of the Bible were not of a grammatical nature, but referred to the idiomatic use of words and phrases. In this respect it must be allowed that Mr. Appleyard, who was more of a scholar than a merely practical missionary, seems, in the first instance at all events, to have based his knowledge of the Kafir language mainly upon the translations made by missionaries, i.e. by foreigners,

and, therefore, necessarily somewhat wanting in that idiomatic nicety which can only be found in the original speech of the natives. But in this Mr. Appleyard only followed the common practice. It need not be said that twenty-five years ago the value and importance of folk-lore, or of the native traditional literature, was not appreciated as it begins now to be; and a missionary cannot well be blamed if at that time he was not aware that this kind of literature when collected was the best and only reliable source for a knowledge of the language beyond constant conversation with the natives. I will not deny that if at that time a good collection of folk-lore had existed, of which Mr. Appleyard could have made use in his studies, both his Grammar and his translation of the Bible would have been the gainers. But, as it is, I can only wish that every South African language was already described in as excellent a grammar as Mr. Appleyard's Kafir one. And, to the last, his interest in these grammatical questions and his acumen in dealing with them were undiminished.

"This was evinced to me by the interesting correspondence which I have had with him from time to time, mainly on the subject of my *Comparative Grammar*. It was a pleasure to be corrected by so eminent an authority, and to read the opinions of one who so well understood the difficulties of the grammatical questions discussed. Although, to my regret, I have never been able to make his personal acquaintance, I sincerely mourn for him, and that not only on account of the great loss thereby sustained by philological science in South Africa.

"W. H. I. BLEEK.

"Mowbray: April 20, 1874."

A LETTER from Dr. G. Bühler, of Bombay, dated Bikanir, February 14 last, and communicated by Professor Weber in the *Sitzungsberichte* of the Berlin Academy, contains some very interesting information about the library of the Jaina community at Jessalmir, one of the chief centres of that sect. Dr. Bühler had received from Gujeratis some very wonderful accounts of the extent of this collection, which has never before been examined by any European scholar. These statements turned out to be greatly exaggerated. From a not very accurate list prepared some ninety years ago, Dr. Bühler concludes that at that time the library must have consisted of some 450 to 460 works, many of which have since been destroyed. There are, however, still about forty bundles of old and well-preserved palm-leaf manuscripts, besides a great mass of loose and broken palm leaves, and a number of paper MSS. On examining the palm-leaf collection, Dr. Bühler found that the Jaina literature was but scantily represented in it, and that they contained mostly Brahmanical works. Of the famous Jaina writer Hemachandra, the collection contained three works, viz., his *Chandanasasanam*, five out of seven books of his Sanskrit grammar, and a commentary on the homonymous part of his dictionary. The discovery of the last work settles the question as to the authenticity of that portion of the *Hainukosha*. Another work of great interest, of which the first copy has now been discovered by Dr. Bühler, is the *Vikramānka-charita*, a poem on the history of three kings of the Chālukya dynasty of Kalyāni, who reigned in the eleventh century, viz., Somesvara I., Ahavamalla, Somesvara II., and Vikramāditya Tribhuvanmalla. The work was composed during the reign of the last-named king, by Bilhana. Of other important works may be noticed copies of Dandin's *Kāvya-darsa* (MS. dated A.D. 1104), Mammata's *Kāvya-prakāśa*, with a comment by Somesvara, the *Gaudabhadhasāra*, a Prakrit poem of considerable extent, the subject of which is a king *Yasovarman*, and Jayadeva's work on metrics, with a commentary by Harshata. Of the two last-named works no other copies were known. It is to be hoped that measures will be taken to make this valuable collection available to Indian and European scholars, through accurate copies of works and commentaries not hitherto known, and collections of all the ancient manuscripts of standard works.

Dr. Bühler also states that he acquired at Bikanir a number of important Sanskrit works, among which he mentions a nearly complete copy of Bharata's *Nāṭya-sāstra*, the *Setubandha*, the commentary on the *Satapathabrāhmaṇa*, and the *Atharvaveda-prātisākhya*.

THE *Augsburger Zeitung* of May 19 states that the University of Strassburg has proposed the following subject for the triennial prize, founded by Professor Max Müller: "*The Antiquarian Results to be deduced from the Rig-Veda-Samhita with reference to the early Seats, the Mode of Life, and the general State of Civilisation of the Vedic Aryans.*" All students who have been at least for two years resident in the University of Strassburg, and who have not exceeded the fourth year after taking their degree, may compete. The essays may be written in Latin, French, German, English, or Italian, and must be sent to the Dean of the Philosophical Faculty before December 1, 1878. The prize to be awarded is 750 marks.

THE *Revue Bibliographique de Philologie et d'Histoire*, of which the first number appeared on May 15, promises to be useful, particularly in its bibliographic department. M. Leroux, the editor, is known as an enterprising publisher of Oriental works, and as agent of various Oriental societies. His new review is to be published every month. If it is continued on the present plan, it will soon become an indispensable guide to every student of philology, more particularly of Oriental philology.

MEETINGS OF SOCIETIES.

CAMBRIDGE PHILOLOGICAL SOCIETY (Thursday, May 21).

A PAPER was read by Mr. Paley "On Greek Puns and Words used *παρά προσδοκίαν* by Aristophanes." The writer apologised for imperfect treatment of an extensive and important subject, and proceeded to show that words called *ἴσα* and *ὁμοῖα* (Plat. Symp. p. 185 c, Ar. Nub. 394), that is, having the same number and quantity of syllables, and the same terminations, but not very like in sound, formed the bases of very numerous, but not always obvious, jokes in Aristophanes. Examples given were *βουρή* and *πορὴ* in Nub. 394, *πόλος* and *τόπος* in Av. 180, *πόνος* and *γόνος*, or *τόκος*, in Vesp. 1,115, which was compared with *quanta pernis pestis veniet* in Plautus, Captivi 903. It was shown that, besides puns proper, or the use of words of similar sound, words of similar metre were also frequently employed for the purpose, as *κρηβανίτας* and *καλλιβαντας*, *ἀσπίδος* and *κιστίδος*, in Ach. 1,122, 1,136. On this principle, many words were used *παρά προσδοκίαν*, i.e., other than what the context suggested, and were left to be implied by their similarity to the right word, as in Equit. 279, *ἐξίγειν ζωμέματα* is used for *ἐξίγειν ζωννύματα*, or *ὑποζώματα*, and Vesp. 447, *τῶν παλαιῶν ἐμβάδων* really means *τῶν παλαιῶν δισποτῶν*, *ἰβιδ.* 850, *ἀλοκίζειν τὸ χερσὶν* for *ἀλοκίζειν τὸ κερσὶν*, "to scratch a line on the waxen tablet," &c.

Mr. Birks read a paper on the nature and limits of Internal Evidence, especially as suggesting rules for the interpretation of words and phrases, of which *θαλίω* and *πρὸς κίον* were selected for especial comment and illustration.

PHYSICAL SOCIETY (Saturday, May 23).

PROFESSOR GUTHRIE gave an account of the contents of a paper by Mr. Ridout, on the Construction of Galvanometers, from which it appeared that, in order to obtain greater sensitiveness, the author recommends a return to the old plan of supporting the needle on a point by means of an agate cap, and to bring the wire nearer to the needle by omitting the frame on which it is often wound. Professor Guthrie described and exhibited a Torsion Galvanometer in which the strength of the current to be measured is deduced from the angle through which it is needful to

twist a fine platinum wire in order to balance the repulsion between two pairs of very small electro-magnets. Two of these electro-magnets are fixed with their axes perpendicular to the straight line passing through the centres of both; the other two are similarly placed relatively to each other, and at the same distance apart as the first pair, but are suspended to the torsion-wire at a point half-way between them, the two ends of the continuous conducting wire, which forms the coils of both, being bent vertically downwards and dipping into mercury-cups placed vertically below the point of suspension. The current to be measured traverses the coils of the fixed and moveable electro-magnets in such a direction that these always repel each other. In using the instrument, the moveable electro-magnets are brought to a fixed distance from the stationary magnets, by turning the torsion-head, before the current passes; then, when the current is traversing the coils, the torsion-head is turned so as to force them back to their original position as indicated by a ray of light reflected on to a scale from a small mirror attached to the suspended system: the strength of the current is then very approximately proportional to the square-root of the torsion required. In order to illustrate the mode of using the apparatus, Professor Guthrie employed a simple arrangement, devised by his assistant, Mr. Wilson, for obtaining two currents, one of which is exactly twice as strong as the other. Two wires, each of them of the same resistance as the galvanometer, were connected together in multiple arc and inserted in the circuit between the battery and galvanometer; one of the wires was next removed from its previous position and inserted as a "shunt" of the galvanometer. It is obvious that in both arrangements the total resistance of the circuit was the same, but that in the first case the whole of the current, and in the second case half the current, traversed the galvanometer.—Mr. F. Clowes exhibited a cell for containing liquids when experiments with them are to be projected upon a screen by means of the electric or oxyhydrogen light. The cell was formed by placing a bent piece of india-rubber tubing between two flat glass plates, and binding the plates together by means of strong india-rubber bands round the ends.

In consequence of the Visitation of the Royal Observatory, Greenwich, on Saturday, June 6, the meeting of the Physical Society announced to be held on that day will be postponed till Saturday, June 13.

GEOLOGICAL SOCIETY (Wednesday, May 27).

MR. J. EVANS, F.R.S., President, in the Chair. —A paper "On the last Stage of the Glacial Period in North Britain," by Mr. T. F. Jamieson, was read by one of the secretaries. During the glacial epoch three distinct stages may be recognised: first, a period of land-ice, when the country was overspread with extensive glaciers; then a time of submergence, when marine beds containing shells, mostly of Arctic types, were deposited on the floor of the glacial sea; and finally, a second period of land-glaciation, when sheets of ice again extended over the greater portion of Scotland and the northern parts of England and Ireland. Hence the last episode in this series of events was glacial, not marine; the latest occupant of the surface of the country was ice, not sea. During the second ice-period, the previously-deposited marine beds were in great part swept away by the erosive power of the glaciers; hence remnants only of these beds are now found distributed here and there in scattered patches. In support of this view of the concluding event in the glacial series, the author pointed to the well-preserved moraines, and to the freshness of the glacial markings even at the present day. Mr. Jamieson believes that the deposits of gravel known as "kames" in Scotland, and as "eskers" in Ireland, were formed along the margins of ancient glaciers, and are not due, as commonly supposed, to the action

of marine currents. He is further inclined to regard many of the gravel terraces on the sides of the Scotch rivers as fresh-water glacial deposits rather than as ancient sea-margins. Whilst the northern part of our islands was subjected to a second glaciation, extensive beds of snow appear to have extended further southwards, and the author attributes to this snow the formation of much of our English warp and brick-earth. —The Rev. T. G. Bonney, of Cambridge, read some notes "On the Upper Engadine and the Italian Valleys of Monte Rosa," with special reference to the glacier-erosion theory of lake-basins. Whilst admitting that certain lake-basins may have been ploughed out by glacial action, as originally suggested by Professor Ramsay, the author maintains that none of the larger Alpine lake-basins have been so formed, nor have they been subsequently modified, to any great extent, by the action of ice.—The Baroness Burdett Coutts exhibited a fine mass of crystalline corundum, passing into the translucent red and blue varieties akin to the ruby and sapphire, from North Carolina; and Professor Tennant exhibited some unusually fine crystals of zircon.

FINE ART.

ROYAL ACADEMY EXHIBITION.

(Fourth Notice.)

I RESUME the thread of these brief notices with two pictures somewhat akin to that of Mr. Fildes in sentiment and in style of work, by the distinguished Flemish artist, M. Israels. The life-size figure of a peasant girl sewing (621) hangs at a height which, to judge by his other piece (665), may lend this an air of greater refinement in execution than it possesses; for although the picture nearer to the eye has refinement in feeling to an exquisite degree, and an obviously felt intention in every touch; yet Rembrandt, whom one thinks of at once for several reasons, reminds one also of quite a different order of execution in similar subjects, in point of delicacy and multitudinous gradation. When this has been said, little remains here but to admire. The truthful earnestness and gentle look of expectation in the girl's face redeem the homely features; the hands and feet, though of peasant largeness, are free from the coarseness which hurt the effect of M. Dalou's terra-cotta group of last year; and the whole picture has the unity and breadth of tone which we see so rarely in modern work, as to suggest that artists consider that this desirable quality must have been conferred, not by skill of hand, but by some blind "process of the suns," upon the canvases of the older masters.

The other picture by M. Israels, a cottage interior at twilight—a wife by the window, three children at supper—is so simple and pure in sentiment that it needs no praise to emphasise its merits. Only I would note here, in contrast with what was remarked on the *North-West Passage*, how completely and easily the whole story is told. Nothing can be less studied in appearance, more simply natural, than the arrangement; yet every line aids the main purpose.

With a notice of Mr. Marks' fine "decorative" group of mediæval musicians in winter (928) as a specimen of a kind of art which, probably, no one of our artists could cultivate with more success, we may pass to the last figure-subject, uniting common life with elevation of style, which remains for comment. This is the French coppersmith (24) by M. Legros, a painter long settled among us, and whose great ability receives, year by year, a recognition, whether from the Academy or from critics, which has often struck me as insufficient. M. Legros has few rivals now, whether in France or here, in a forcible and dignified conception of his subject, a large and manly treatment, a grand scheme of colour and *chiaroscuro*, and a power of almost homely truth to nature united with a subtle infusion of ideal character. A certain want

of interest and want of variety in his choice of subject, as if he did not care to take any trouble to please the spectator, I have sometimes thought, has stood greatly in his way; pictures by him in which every inch had been not only studied, but felt, have thus occasionally looked as if they had much "space to let," as the phrase goes. He seems to paint for a less restless age, and for those (perhaps never numerous) who value art for art's sake; his style is one

"Fitted for the needs
Of hearts at leisure."

The *Chaudronnier*, however, wants neither sufficient interest, nor attractiveness in its colour, which is rich and singularly harmonious: it is doubtful whether any piece, of all here exhibited, would equally well stand comparison with the Venetians, or Velasquez, in the qualities of unity and repose. Let any one look carefully at this work, and then round the room, or take the remembrance of it further (as, for example, to Mr. Millais' figure-subjects, or the portraits in general), and the merits of M. Legros' work in the points just noted will be clearly perceptible.

Among our few sacred subjects, the *St. John leading home the Virgin*, by Mr. Armitage (218), must be ranked highest. This artist has a severe and pure precision of design, which, by a natural law of compensation, especially and even clamorously calls for richness and transparency of colour, in place of harmonising, as is sometimes fancied, with austerity of tint. In this richness Mr. Armitage's work is deficient; and with this deficiency, perhaps, is allied a certain want, not of passion, but of a pervadingly passionate atmosphere—*desideranda* which, if in the work of so able a man I may note them without presumption, should not, to an intelligent spectator, obscure great countervailing merits. The Virgin and the saint are singularly pure and elevated in expression; the action renders perfectly the moment represented—tender respectfulness on his part, on hers simple and entire absorption in sorrow; nor is there a better-designed piece of drapery in the Exhibition than the Virgin's. Might not the effect be increased if a piece were taken from the canvas on the right? The crowd behind is the least successful portion.

Mr. Herbert's *Adoration of the Magi* (308) is another picture not likely to gain the praise which it deserves. Here again the colour, though with some elements of solemn effect, is unattractive; the group of the Child and Mother, in grace and expressiveness, falls below many with which we inevitably (though not altogether justly) compare it. Yet the scene is conceived with a seriousness and an effort at realisation for which one would look in vain either among the later Italian masters or their imitators. It is a genuine if not an inspired rendering. With a less arduous theme, Mr. Herbert's *Sower* (431) is proportionately more successful.

Mr. Horsley's *Healing Mercies of Christ* (128) has met with little favour among its critics. This was indeed not a task which one would have naturally imposed on an artist whose own style lies in a direction so different; nor can I dispute the verdict that the drawing wants power, the colour richness, and the whole that elevation of style which great religious art requires. But we judge religious art habitually by a standard very severe, and, I think, not really just to our contemporaries. Our eyes filled with the exquisite creations of grace and dignity into which the efforts of many centuries blossomed during one century in Italy, we make these the standard which every religious picture is bound to reach; whilst we forget the infinitely greater mass of religious work produced during the middle ages in Italy and all over Europe which (if the delightful illusion of antiquity be set aside) has, in fact, neither grace nor dignity nor inspiration. An essay would be required, however, to work out and to support with proof this remark, which I offer here as a suggestion only; let me

briefly add my inference, that pictures such as Mr. Armitage's and Mr. Herbert's are really considerably higher in the scale than they are often rated; and that Mr. Horsley's, compared with average ancient success in any subject of the kind, is much above failure. It will assuredly give great and continued pleasure to the sick people, in whose sight it will be hung, and for whom it was painted; and although such a success does not satisfy the standard by which art is to be tested, yet it is one which a man must be very far gone indeed in criticism to regard with indifference.

A short survey of some single figures, generally life-size, may lead us to the portraits. A girl from Venice, and one from Capri, respectively by Miss Backhouse and Mr. Sain (408, 1,040), are worth notice; the first is a very animated figure. Add to these a very pretty child, frowning with pleasure over her book (1,407, S. Sidley), and another in profile (450); this is by Mr. Archer, whose larger portrait groups this year are less satisfactory, although they give the impression which Mr. Sant's work often has left, that the artist might be capable of higher work. The *Cynthia* of Mr. Calderon (1360), like the *Confidante* of Mr. Prinsep (27), rather lacks interest. To make a really effective figure-subject from a young lady sitter of the present day I conjecture to be a very difficult matter, requiring great force both of painting and of feeling to lift the work above the sphere of dress, or affectation, or false sentiment. The presence of a foreign element hence affords great assistance—witness Mr. Long's *Gipsy Girl* (1,354). Here is so unusually beautiful a head that the picture may be almost said to "make itself." The treatment of the drapery is rather in the manner of Mr. Faed; and there is something empty and artificial about the brown shadow behind. This picture should make a very effective engraving.

Mr. A. Moore, after promising much manlier and more varied art, has for the present settled into a style of his own. His are the figures in Grecian dress, graceful and languorous in attitude, rendered as if the "tinted sculpture," which we know of through theories rather than anything more substantial, were always before the artist's mind. The tints are chosen and balanced with singular refinement; and although I doubt whether so much be gained in the way of praise or justification, as the admirers of this style appear to believe, by calling it "decorative art," yet, within the very narrow compass selected, Mr. Moore has fully worked out his idea and made his mark. But it is one thing to succeed so far, and another to reach such a success as the possibilities of the art admit. These, of course, are but slightly exhausted within the limits found here; compared to painting in its full scale of colour, design, and subject, this style is like an organ played only on the flute or hautboy stop, and an organ played "through all its diapason." Hence, also, anything short of such completeness as Mr. Moore has gained will be feeble and unsatisfying; and I trust that Mr. Armstrong, who in subjects from actual life has shown some promise, may think fit to abandon the "false road" of imitation displayed in his *Girl and Tortoise* (1,054).

Portraiture offers a difficult field for literary criticism. Although there must, always, inevitably be much of it (a fact provoking frequent and rather unreasonable complaint), yet the range of style in this branch of art is comparatively small; and its personal nature makes either praise or blame rather awkward: to talk of a man's portrait is too much like talking of a man's self. Add to this that our contemporary portraiture (so far as the present writer can judge) hardly outruns the level of the second-rate work of the last century: at any rate, whatever can be urged in favour of special productions, it may be said without harshness that no Hogarth, Reynolds, or Gainsborough is now conspicuously and indubitably among us. *Eroriare aliquis!* will be the wish of all who think thus; especially if, as has been

sometimes argued, the standard reached in portraiture may be taken as a test of the general excellence of any national school.

Unless, however, we were to judge of the portraits by the same ultra-severe rule which is generally applied to religious art, it will be found that much of worth remains among our long-established names and our more recent aspirants. Of the latter, Mr. Oulless is perhaps the most recent, and the most popular. His individuality of style, coupled with the great demand for portraiture, has brought him rapidly forward. If such a suggestion be permissible, I hope that this popularity will not induce him to lay aside that simultaneous practice in other regions of the art without which it is difficult to believe that the monotonous practice of portraiture will not stereotype a painter's manner, and retain him below the highest level of his special province. The rendering of character, the direct object of the portraitist, seems hitherto to have been Mr. Oulless' almost single aim; and perhaps his style, in which the lines of the face are apt to be rather over-emphasised, makes us too conscious of this object; but portraiture as a fine art, not as the medium for supplying a social want, requires more—very much more—even when the essential element of character has been secured. Of the pictures now exhibited, Mr. Oulless seems to me to be seen at his best in Nos. 1,351 and 697; these are very bright, and have a great look of likeness.

Mr. W. Richmond and Mr. Armitage, artists who do not confine themselves to portraiture, each exhibit one portrait (721 and 1,343). These are both decidedly above the average, at once in rendering of character and in pictorial effect; they might interest as pictures where the originals were wholly unknown: that test of portraiture as a fine art. If Mr. Richmond's had been better placed, the figure, I think, would have told more efficiently; the head is ably and firmly "modelled," without the "smoothness" which frequently mars finished flesh-painting. Mr. Lehmann's work, like that of German artists in general, rarely escapes this quality with so much success as in his *Persian Ambassador* (1,373): perhaps because the artist has left it as a sketch.

The four portrait subjects by Mr. Millais seem to me less successful exhibitions of his peculiar gifts than his *North-West Passage*. Perhaps this lies in the nature of the case. The dominant sense of the painter's natural mastery of his craft (to which I called notice in a previous paper) which his pictures arouse, is more in harmony with a dramatic invention than with a portrait, especially the portrait of a child; remembering, as we must and ought, the exquisite poetry and grace of *naïveté* with which our own older school has so often invested childhood, the impression of technical *bravura* here becomes unpleasant; the mind asks that the artist shall be lost more completely in his work; that he shall himself "become a little child," and give proof that he has been palpably inspired by his subject. Display and self-consciousness here are as fatal to charm as they would be in case of the child itself. Hence the little girl (152) is quite unattractive; it is truly a *Picture of Health*, and no more; although it shows that able handling which the artist can always give when he likes, but which, however, he has failed to give, rather signally, in the boy-portrait (95). The child in russet frock and pinafore (484) has more of that simplicity and charm which the age imperiously requires; the background here is also a marvellous piece of natural intricacy: not slovenly, yet never intrusively imitative. One can only wish that the type of face had been more gracious.

A child's portrait by Mr. L. Moore (1,427) may serve to illustrate these remarks. This picture is coloured in a low, almost a conventional or fancy key; it wholly wants the force and salience of Mr. Millais' work; yet, so far as its art goes, the real look of childhood is much more truly given; it has grace

and feeling; it tries to render the soul animating the features and person—the technical power must be vast indeed which can afford to dispense with these qualities!

Mr. Millais has, put forth this power obviously enough in the figure of a lady seated in a garden (1,432), which hangs close to the picture just noticed. Probably there are few artists who do not look, with admiring envy, on the manifest mastery over oil-painting here shown; the simple spectator must ask whether the charm of expression, subtle or powerful, be present; if there be grace in the lines, refinement in the features—attractiveness, in short, anywhere beyond the technical ability? This picture has been spoken of as in "Gainsborough's manner," and again, as in no sense a mere imitation of Gainsborough. The latter remark is the truest. And, in the absence of these charms, so characteristic of Gainsborough, the comparison with that great artist which this picture has provoked is unfortunate. Each painter, indeed, has his own powers, and genius is so infinite in its varieties that, whilst we may amuse ourselves by trying to compare the total weight, as it were, of those who possess it, we can seldom with safety carry such a comparison into the elements of which it is composed. One man is rarely the parallel of another: how much more rarely one poet or painter! Such a phrase as "the Hogarth of our century," or the like, is a very easy, but also a very deceptive and unsound, formula of criticism.

Many readers will, perhaps, dissent freely from these remarks. But most will agree in Mr. Watts' place as our leading portraitist; although here, again, the agreement would cease if the precise degree, not of relative, but of positive, ability thus indicated were to be debated. Passing this, the charm of the two female portraits which Mr. Watts shows (44, 318) is of that order which our art much wants; they are works which (so far as they go) must teach, even to the uneducated, a true lesson in the meaning of refinement. Few men have more than one very decided gift; and this (to me) is Mr. Watts'. In heads requiring force he is hence less completely happy: less true to himself. It is not meant to deny this quality to the portraits of Mr. Martineau and Mr. Mill: yet the painter here seems to reach his aim with conscious effort. The emotional side of the intellectual nature is prominent in both of these fine and interesting works; and in both the subdued key of colour which characterises the artist appears to pass, if I may venture upon the phrase without impropriety, a little beyond his management. In the case of Mr. Mill, especially, the face is "sicklied o'er" with *post mortem* pallor:—that intense hopelessness of existence, that unsatisfied hunger of the soul, which colour Mr. Mill's singular *Autobiography*, seem to have passed into the painter's palette. Here also, as in the book, one sees the highly-gifted man who could never bring into harmonious unity the emotional and the intellectual elements of his nature; the forehead is oppressed, not radiant, with thought; the lips quiver with an almost querulous sensitiveness; in a word, if to set forth an admirable commentary on the *Autobiography* be also, in this case, the highest aim of portraiture, Mr. Watts' success is complete. Had the likeness of Dr. Newman, by Mr. Roden, been hung lower, it would have been very interesting to make a comparison between the heads of these two gifted and influential contemporaries. As things stand, I can only infer that Mr. Roden's portrait has very considerable merit, both as a likeness and a work of art.

The President exhibits two pictures which have a quality very uncommon, and very attractive, in portraiture—an eminently simple and unselfconscious air—110 and 180. The last represents a young lady knitting. The unaffectedness of this little canvas gives it a charm which the prevalence of clever eccentricity of all kinds renders more valuable.

Space compels a bare enumeration of other portraits worth notice. Such are Mr. Archer's lady (369); the artist's mother by Mr. Eddis (1,358); Mr. Macbeth's male portrait (1,413); Mr. Cotman's (61), which looks a lively likeness. A portrait by Mr. Ridley (696) has much originality in treatment and look of likeness. Let me also specify M. von Angeli's careful and graceful Crown Princess (395); a child, by Miss Brooks (488); and another by Miss Donkin (1,423). The last shows a hand as yet rather constrained; but there is enough of true colour and conscientious drawing here to make us look for future distinction.

A few life-size portraits in the water-colour room exhibit (I suppose) the great, perhaps the insuperable difficulties of work upon this scale in this medium. Unattractive flimsiness or false, feeble finish are the opposite poles to which the artists appear to be inevitably drawn. But is there not something trying and unfair to each medium in turn, in this juxtaposition of oil and water-colour work? F. T. PALGRAVE.

THE PARIS EXHIBITIONS.

Les Impressionnistes—Chintreuil.

Paris: May 25, 1874.

THE Salon, after accomplishing half its allotted term, closes its doors to-morrow, and will re-open on Thursday next, to close again June 20. A label affixed to the frame of a picture or the pedestal of a sculpture will mark the works which have received a medal from the juries, and a general rearrangement will bring to light those which had been sacrificed during the first half of the Exhibition. It is the natural occasion for critics to speak of works whose interest had not at first struck them. In connexion with the question of official prizes, it is an occasion for myself in particular to speak of the relative position of some of the groups which divide our school.

The Exhibition opened on the Boulevard des Capucines by a group of artists who had not contributed to the Salon closed a few days since. I should not speak of it had it not raised certain questions which are, in my eyes, highly important. It seems to me, at least, that foreign correspondents who only spoke of the absolute or relative merit of individuals would soon weary their readers, and that it is more reasonable to study the formation and tendency of general currents.

Thirty artists formed themselves into a co-operative society with a view to a joint exhibition in public of their works—oil paintings, pastels, water-colours, engravings, drawings, enamels, statuettes. A painter, some of whose pictures you have seen in London at M. Durand-Ruel's, M. Edgar Degas, was the promoter of the enterprise. Among already known names were remarked M. Z. Astruc, Bracquemond the engraver, Boudin, Brandon, Lejeune, Mdlle. Berthe Morizot, a pupil of Gustave Manet, and the extreme realists, Renoir, Monet, Sisley, Pissarro, and Cézanne. They contributed jointly to cover the preliminary expenses. Each of them in turn visited the galleries to place himself at the disposal of amateurs. The gas was lighted at dusk—an innovation in Parisian exhibitions. The house selected was that of the famous photographer Nadar, compared in his youth from his long fiery red hair, and the swiftness of his walk, to a wandering comet. They naturally had rejected the principle of distributing medals, which is in France the chief cause of the debasement of the artist's character.

These details may seem puerile, but in France they are quite novel. The administration of the Fine Arts had the good taste to show no signs of ill-will. It even affects to see in this Exhibition a confirmation beforehand of the liberal projects which it has laid before the artist-world; for you are already aware that M. de Chennevières' first act was to give notice to the artists that he required them after the Salon to join in founding a free Academy. The art-journals preserved a

prudent silence. The *Siècle*, having on its staff M. Castagnary, an intimate friend of Courbet and formerly an ardent defender of realism, christened these independent young artists, happily enough, "The Impressionists." The *Constitutionnel*, having on its staff M. Chesneau, late secretary to M. de Nieuwerkerke, justly regretted the absence of M. E. Manet. The *République française* frankly declared itself in favour of the general idea, which has a very close connexion with the movement that we must support unceasingly if we would escape plunging into the tyranny of formulas such as prevailed under the First Empire and the Restoration.

The chief object of these gentlemen, whose views, temperament, and education are very dissimilar, was to present their paintings almost under the same conditions as in a studio, that is, in a good light, isolated from one another, in smaller numbers than in official exhibitions, which are like docks of painting and sculpture, without the neighbourhood of other works either too bright or too dull. They feel that their style of painting, whether by simplicity of design, or by simplicity of tone, or by simplicity of composition, looks like a challenge or a caricature when placed side by side with works conceived under the pre-occupation of mannered design, artificial tones, or subjects intended to provoke laughter or emotion by the most vulgar artifices. They would prefer starvation—and some perhaps are loyally keeping their haughty vow—to filching their figures out of engravings, "painting with pomatum," or ransacking the Musée des Copies to find a subject. They renounce success, medals, decorations, and even the esteem of their fellows, to pursue a purely artistic end. They depend upon elements of interest strictly aesthetic, and not social or human—lightness of colouring, boldness of masses, blunt naturalness of impression. I, for my own part, am quite won over to this doctrine. I find it, with varying modes of expression, in all the masters of all the great epochs. It is a mark of intellectual honesty in all those who practise it. But I admit in the first place that, from the governmental point of view, it is heretical, worthy of the dungeon, the torture and the stake; in the second place, that, from the practical point of view, it draws young beginners into tracks where they no longer have the lamp of tradition to guide them; that it forces them to forge their own weapons like our ancestors of the Stone age; that it produces a class of works oscillating between a perfection which speaks simply to the senses, and attempts which are simply childish; lastly, that, based on the swiftest possible rendering of physical sensation, it considerably narrows the domain of painting. It scarcely leaves room for any but decorative motives; it forbids itself the stirring representation of those complex situations in which the mind collects its forces, and takes possession by analysis of places, situations, sentiments. It is as a band of artists floating down a rapid river, drinking in the intoxicating effects of the sun, the shade, the verdure, the freshness, the perfumes that wander over the water and the banks, and never casting anchor or bringing their bark to land.

And yet, in spite of all allowances for the *lacunae* that such a system entails, it is certain that it will have a satisfactory influence over the contemporary French school, with its black, bituminous or grey colouring. Already the Japanese albums—light, radiant, fresh in aspect and delicate in colouring—have made the many reflect. They feel that all that art can give is not confined within a single formula; and that admiration for the ancient masterpieces of oil-painting has led us to take, as the basis of painting itself, those dark tones which have only been produced by the action of time.

M. Edgar Degas is at once the least revolutionary and the most scholarly member of this group. He is the master of a highly accom-

plished science of design, which he only exercises on a small scale, just as he concentrates his very delicate and refined attention on a few original types: sporting-scenes, ballet-girls on the stage or at rehearsal, and washerwomen. It is he who in this place has had all the success. He is a man of the world, and a man of genius. He has come with honour out of his venture, which must have caused cruel reflections in the intriguers who head the *coterie* of the juries.

Mdlle. Berthe Morizot is a young lady of fine natural gifts, who is steeped in the influence of M. Manet, but has preserved intact her feminine sensibility and her original taste. Her colouring is fresh and subtle. She can give us an admirable sketch of a landscape with figures, as a young mother in a muslin dress playing with her little daughter in a garden. This may be compared with the page of a novel read at haphazard in a review or on a railway journey. It is exquisite and unfinished.

M. Monet, M. Pissarro, and M. Sisley are the great *go-aheads* of the group. Nothing, I believe, would offend them more than to compare them, even favourably, with Théodore Rousseau or Corot, or to anybody, for nobody exists for them. They apply to themselves the motto of the Papacy: *sim ut sum aut non sim!* M. Monet has, however, condescended to paint a figure-piece, a *déjeuner* with figures life-size, remarkably energetic in tone and effect, but betraying a lamentable want of finish. M. Renoir, who presents some singular points of affinity to Turner, has given us some reapers in a field of ripe corn, and has rendered, with supreme fidelity to modern life and artificial light, a lady and gentleman seen at half-length in a box at the play.

But here we discern the faults of youth: in M. Monet, when he betakes himself to the country, in M. Sisley and M. Pissarro, when they suppress not only the human race, but also what the human race is accustomed to see there, that is, trunks of trees modelled according to the light that falls upon them; branches with well-defined knots, and the joints visible; houses square or oblong. Yet in spite of all these suppressions, which are far more radical than all the manifestations of the pre-Raphaelite movement in England, there remains, when the work is successful, a singular illusion of light and freshness; the masterly harmonising of ground and verdure with the blue sky and the white clouds; shadows or reflections exquisitely fleeting.

In short, if we meet in this company of young and resolute men no personality which gives us the impression of genius, we must at least recognise in them the quality and services of forerunners. Others will come after them who will turn their efforts to good account, and assign them their true position.

I may still speak to you, as it will be open till the end of the present month, of the posthumous exhibition of the works of Chintreuil, the landscape painter, organised by his friends on the ground-floor of the Ecole des Beaux-Arts. The Ecole had already lent these rooms to classics—Ingres, Hippolyte Flandrin, Bertin; never to a landscape painter, particularly to one often rejected by official juries. This concession, which has been the subject of much remark, does honour to M. Guillaume, the director of the Ecole, and it is hoped that it may be repeated in the case of other masters. Tassaert is already spoken of, a man of talent and originality, who died but very lately at a great age, almost blind, and in a state of destitution. We may also think of Gleyre. This trial is to painters like that which the Pharaohs underwent at the threshold of the tomb.

Antoine Chintreuil must be wholly unknown to you. It is scarcely likely that any of his paintings has ever crossed the Channel. I cannot with the pen give you an idea of his colouring, which without being forcible is sustained and accurate. But I may bring to your notice an illustrated catalogue of his works which has just been printed by the publishing house of M. A. Cadart. Each leaf

contains six or ten etchings, most of them engraved by M. Martial, with the utmost regard to composition and effect. There are several hundred subjects—brooks running under the willows, furze-bushes in flower, ploughed lands, hedgerows of ash and poplar, farms half-encircled with hayricks. The catalogue of these works, which will probably be sold by auction in the course of next winter, has been drawn up, together with a life of this eminent artist and excellent man, so simple and so devoted to his art.

Antoine de Chintreuil was born at Pont-de-Vaux, department of the Ain, in 1814. He was brought up by his mother, and came to try his fortunes in Paris in 1838, very poor in gold and silver, but rich in illusions. He had drawn a good deal, as boys draw at college. He applied to a *savant*, who declared him incapable even of designing plates for books on natural history, and had him apprenticed to a bookseller. There he made the acquaintance of another bookseller's clerk, who afterwards became a distinguished writer, Champfleury, and, thanks to the friendly protection of Béranger, he succeeded in selling enough of his attempts to be able to give himself up seriously to the study of painting. About 1845 he received from M. Corot some of the advice in which that great master excelled, and he was enabled thereafter to pass the door of the Salon, then guarded by the Institute with jealous care. His health, undermined by consumption, and watched over only by the devotion of his friend, the painter J. Desbrosses, kept him almost always away from Paris.

He was endowed with exquisite sensibility. He was struck with the grand effects of Nature: sunrise in a country where vast plains succeed to cultivated fields, making the earth smoke like an open censer; the spring, tingling the lines of apple-trees with red, and gilding the furze-bushes in the hedgerows. He gave his pictures high-sounding titles: *Space*, or *Sun and Rain*, and his work answered to the title, or, at least, distinctly marked its intention.

He died in August 1870, at La Tournelle, having heard only the first peals of the storm which was about to break over his country.

PH. BURTY.

ART SALES.

THE sale of the collection of the late Baron Theis terminated last Wednesday. The Limoges enamels were very numerous; most of them were in the Paris Exhibition of 1867. They sold for the following prices:—Triptych, by N. Pénicaud, in grisaille, with coloured enamels heightened with gold—the central subject Calvary, those on the wings the Resurrection and the Kiss of Judas—5,220 fr.; a square painting, by the same artist, heightened with projecting enamels to imitate precious stones, 965 fr.; four small rectangular plaques in coloured enamels upon "pailions" (or gold leaf ground), heightened with red enamel of the richest tone, representing scenes from the history of St. Margaret, all stamped with the name of Jean II. Pénicaud at the back, 3,200 fr.; small picture, partly on "pailions" and heightened with gold, representing the Nativity, 1,450 fr.; a small triptych, 2,490 fr.; and a casket in grisaille on black ground, 1,400 fr.—all three by Jean III. Pénicaud; Portrait of Francis I., 3,800 fr., and the Saviour bearing the Cross, 2,060 fr., both by Léonard Limousin; a large oval dish, grisaille, flesh-tinted, on black ground heightened with gold, with various subjects from Genesis, by Pierre Raymond, 10,000 fr.; two small medallions, a Holy Family and the Annunciation, by the same, 1,700 fr.; scenes from the Trojan War, by Kip, 3,400 fr.; large triptych, composed of six plaques, painted in grisaille, flesh-tinted and heightened with gold, by Pape, 9,550 fr., and two circular pictures, by the same, representing mounted horsemen, lettered in gold "Josve roy" and "Artus, roy de Bretagne," 1,380 fr.; a mythological subject, by Suzanne

Court, 810 fr.; a Holy Family, by Jean Limousin, 1,065 fr.; and various others by the Noulher and Laudin families, Poncet, and other artists of the Louis XIV. period. The sale lasted seven days, and realised 254,773 fr. (=10,197*l.*).

THE pictures of Mr. James S. Forbes, chiefly consisting of works of foreign artists, were sold last Saturday at Christie's. The following are some of the prices: Vautier, *Age and Childhood*, 250 gs.; Lamorinière, *An April Day*, 105 gs.; A. Calame, *Lake of Lucerne*, 315 gs.; P. J. Clays, *Dutch Boat in a Calm*, 172 gs.; and by the same master, *Outward Bound*, 385 gs. Pictures of J. Israel sold as follows: *Desolate*, 110 gs.; *On the Strand*, 150 gs.; *First Sail*, 750 gs.; *Breakfast Time*, 820 gs.; *The Remedy*, 770 gs.; *Out of Darkness into Light*, 710 gs. Fromentin, *Near Cairo*, 190 gs.; L. Frère, *Old Friends*, 250 gs., and his *Seamstress*, 240 gs.; F. Willems, *The Fortune Teller*, 175 gs.; A. Stevens, *La Dame au Bouquet*, 245 gs.; Daubigny, *Morning*, 280 gs., and *Evening*, 270 gs.; Sallentin, *The Foundling*, 200 gs.; R. Burnier, *On the Y near Amsterdam*, 300 gs.; Gérôme, *Prayer in the Market Place*, 730 gs.; O. Achenbock, *Rocca di Papa*, 225 gs.; F. Fagerlin, *The Introduction*, 300 gs., and *Grandfather's Visit*, 360 gs.; J. Breton, *When the Cat's away*, &c., 530 gs.; Collins, *Cromer Sands*, a sketch from Mr. Gillott's large picture, 250 gs.; H. Schreyer, *Bedouins*, 325 gs.; Troyon, *A Cliftonnière*, 100 gs.; Frith, *The Waiting Maid*, 155 gs. The 171 pictures realised 20,700*l.*

At the sale of Mr. Farnworth's modern pictures by Messrs. Christie, Manson, and Woods, the following prices were realised:—Water-colour drawings: *Grace before Meat*, by W. Hunt, 430*l.* 10s.; *Snowdon from Capel Cierg*, by Copley Fielding, 315*l.*; *Benworlich*, by C. Fielding, 420*l.*; *Poole*, by Turner, 430*l.* 10s.; *Bridge of Sighs*, by S. Prout, 315*l.*; *Richmond*, by Turner, 11 in. by 16 in., 819*l.*; *Seaforth Cliffs*, by C. Fielding, 388*l.* 10s.; *Going to Market*, by D. Cox, 304*l.* 10s.; *Folkestone*, by Turner, 630*l.*; *Staffa*, by C. Fielding, 472*l.* 10s.; *Cattle in the Auvergne*, by Auguste Bonheur, 558*l.* 10s.; *Algerian Women*, by A. Elmore, R.A., 357*l.*; *Pembroke Castle*, by Stanfield, 504*l.*; *Katharine and Petruccio*, by A. L. Egg, R.A., 210*l.*; *The Temptation*, by Ary Scheffer, 29 in. by 21 in., 430*l.* 10s.; *Peter the Great and Catharine*, by A. L. Egg, R.A., 315*l.*; *On the Medway*, by J. Linnell, sen., 1,312*l.* 10s.; *Balaam and the Angel*, by J. Linnell, sen., 525*l.*; *The Venturesome Robin*, by W. Collins, R.A., 840*l.*; *The Valley Farm and The Vale of Dedham*, by John Constable, R.A., 84*l.*, each; *St. John preaching in the Wilderness*, by J. Linnell, sen., 787*l.* 10s.; *Coast Scene with Fishing Boats*, by Turner, 136*l.* 10s.; *Fairlight Glen, Hastings*, 105*l.*; *Opening the Gate*, by J. Linnell, sen., 1,050*l.*; *Life in Algiers*, by A. Elmore, R.A., 787*l.* 10s.; *Are Chimney Sweeps Black?* by J. C. Hook, R.A., 1,123*l.* 10s.; *Off Calais*, by C. Stanfield, R.A., 1,155*l.*; *The Holy Family—Carpenter's Shop*, by J. R. Herbert, R.A., 756*l.*; *Sancho Panza and the Duchess*, by C. R. Leslie, R.A., 24 in. by 30 in., 745*l.* 10s.; *The Mouth of the Dart*, by C. Stanfield, R.A., 1,491*l.*; *Hide and Seek*, by T. Webster, R.A., 945*l.*; *St. Mark's, Venice*, by D. Roberts, R.A., 819*l.*; *Past and Present*, by Holman Hunt, 525*l.*; *Harvest*, by J. Linnell, sen., 1,854*l.*, 1,827*l.* 10s.; *The Gambler's Wife*, by Millais, 924*l.*; *Hunt the Slipper*, by F. Goodall, R.A., 630*l.*; *Highland Lassie*, by J. Phillip, R.A., 860*l.*; *Mother and Child*, by T. Faed, R.A., 945*l.*; *The Shepherd's Bible*, by Landseer, 1,470*l.*; *The Garden of Gethsemane*, by W. Dyce, R.A., 16 in. by 12 in., 577*l.* 10s. The total of the 100 lots amounted to 36,200*l.*

MESSRS. SOTHEBY have just published a catalogue of the well-known collection of ancient and modern gems of M. J. F. Leturcq, of Paris, which is to be sold on June 17 and three following days. This fine collection was founded by Guay, one of the most eminent gem engravers of the French

school, who instructed Mme. de Pompadour in the glyptic art, and guided her in the purchase of her collection. At the death of her brother, the Marquis de Menars, Guay purchased many of her choicest specimens, to which he continued to add till his death, when his collection passed to J. M. Simon, his pupil. He, in his turn, bequeathed it to M. Beck, who added considerably to its number, and left it to his adopted son, M. Leturcq, who lost no opportunity of adding fresh specimens to those he had received from his predecessor. The collection, therefore, is the work of a century. The ancient series consists of 458 cameos and intaglios, some of them belonging to the finest period of Greek and Roman art, and bearing the signatures of celebrated artists. The modern division, comprising some 170 specimens, has not many examples of the sixteenth century, when the Medici princes, passionate admirers of gem-engraving, invited the first artists to Florence, and Giovanni delle Carniole, Vicentino, Caradosso, and others, rendered the art illustrious; of that period we only notice the name of Cesari, of whose works Michael Angelo declared art could go no further; and of later date, a superb sapphire engraved with the heads of Henry IV. and Marie de Medicis, face to face, signed 1605, by Colderé, the gem portrait-painter of Queen Elizabeth. To the eighteenth century belong Pichler, and Anna Borghighiani, a female artist, but not the only one who cultivated the art, for Vicentino's daughter assisted her father, and Mme. de Pompadour engraved several gems, one of which, the portrait of Louis XV., is in the Cabinet of Medals at Paris. There are examples of many later artists, among which are those of the First Empire, Anautini, Catenacci, Girometti, and Mastini, who executed glyptic portraits of Napoleon and his family.

NOTES AND NEWS.

MR. E. BURNE JONES has in hand at present various works in different stages of completion. *The Marriage of Thetis and Peleus*, *The First Mirror*, *The Seven Days of the Week*, and *The Triumph of Love* are among the number of those most important. *The Triumph of Love*, which is still but a cartoon, is a composition full of dramatic movement. Love, at once the scourge and joy of his votaries, sits aloft on his high triumphal car urging on to cruel speed the crowd beneath who are harnessed by his chains. They rush forward, stung to mad exertion by the keenness of their anguish and their pleasure. Straight behind them, rolling heavily down the steep incline, thunder the heavy wheels with tremendous impetus, an instant's pause in the furious haste of those below who draw the car and they would be inevitably crushed beneath its threatening weight. *The Marriage of Thetis and Peleus* is partly painted in, and promises to be one glow of radiance; already nearly-finished portions show lovely quality of tremulous colour. The table at which the wedding guests are grouped runs right across the picture in front; to the right, Ate, having thrown her apple of discord, hastens away; the three goddesses rise involuntarily, ready to dispute the prize; and in the background a bright daylight landscape is unfolded before us fresh with rolling waters, where we may "have sight of Proteus rising from the sea; or hear old Triton blow his wreathed horn." *The Seven Days of the Week* is divided into seven compartments. The first holds but one angel, bearing in his hand a globe on which are to appear traces of the first day's work; in the next, he is joined by a second; in the third comes yet another, until at last the full company of seven assemble together in the last. This design, which is yet in the first moments of painting, is remarkable, like all Mr. Burne Jones's work, not only for dignity of treatment, but for the exquisitely pathetic sentiment which pervades every line of the expression. It is this same peculiar and touching sentiment which enhances very definite beauty in the *First Mirror*. Venus has

gathered about her a band of maidens; they have followed her faithfully from afar; and having brought them to the brink of still water, framed in the precious blue of many flowering forget-me-nots, she bids them stoop and look. Venus stands, her seven followers stoop, and kneel entranced in gazing, two at her right hand, then a group of three, then two more a little apart from each other. Behind these figures the faint green which clothes the "long backs of the bushless downs" rolls out in vast undulations; before them lies the chain of lovely images, repeated on the glassy surface of the quiet pool. In each of these four inventions we see that we possess in Mr. Burne Jones an artist of the rarest type, an artist who has in his nature an original vein of poetic feeling which can be expressed only by line and form and colour. With one of this chosen class it must necessarily happen that at first his power over the means of expression will seem inadequate if compared with the force and grasp of his imaginative conceptions. Thus has grown up the popular delusion that Mr. Burne Jones cannot draw; but an examination of any one of his later works might suffice to show that our great designer is also a great draughtsman.

It is not perhaps too late to say a few words of the five or six interesting pictures to be seen at the Institute of Painters in Water Colours, in the midst of much that is provokingly admirable, like Mr. Werner's *Bazaar at Cairo* (172), insipidly pleasant or commendable, or downright offensive, like Mr. B. R. Green's sleek, rosy minx masquerading as a nun. Much the best picture in the gallery is Mr. Linton's *Lotos Eaters* (58): it is an Italian garden of the Cinque Cento, where a noble party have left off a game of bowls, and are looking at an antique presented by a haggard, half-naked artist, who is himself a bronze. The sober light and colour of the southern afternoon, and the splendour, which has nothing theatrical about it, of the noble men and ladies, looks as if the artist had meant to content himself with the poetry of real life; and then the symbolic intrusion of the nude antique, if it is symbolic, seems a little incongruous; and, what is worse, though the whole atmosphere of the picture is ideal, the figures savour too much of the modern Italian model: such an admirable painter and posture master as Mr. Linton deserves better limbs and faces to work upon. *A Dull Day near Streetley on Thames*, by J. H. Fahey (160), has much literal unfamiliar truth and grace in the blank sky and the flat sweeps of green; and *Folkington Hill*, by H. G. Hine (133), has something of the same merit with less strangeness; the golden sweeps of turf remind one a little of the Oxford Turner. Mr. Herkomer's *Arrest of a Poacher in the Bavarian Alps* (158) is very clever and animated, and looks very true, but no person with a well-regulated mind would stop to look at such a scene in real life. Mr. Skill always is poetical in feeling and intention, and his cart-horses under a high bank of muddy sandstone in the picture called *Morning* (155) are almost impressive. Mr. Small's *Evening* (166) is well meant, the expression of the boy and girl is true without missing a certain delicacy, but the figures and still more the faces are blotchily painted, and the trees against the sky are too like a coloured photograph. His *Connemara Peat Girl* (48) is better, though cheeks which look so red under such a sky must be very red indeed.

THE manufactory of Sèvres is at this time executing a pair of magnificent vases to be offered by Marshal MacMahon to the Duke and Duchess of Edinburgh.

THE Minister of Public Instruction and of the Fine Arts announces that there will be held this year, in the Palais des Champs-Élysées, a special exhibition of the national manufactures of Sèvres, Beauvais, and the Gobelins; admission free. The time is not yet fixed.

It is said that the fine Museum of the East

India House is to be permanently located in one of the galleries which, after this year, will become vacant, in consequence of the melancholy collapse of the annual International Exhibitions.

THE project of M. de Chennevières for the decoration of the basilica of Sainte-Geneviève, before mentioned in the ACADEMY, having been approved by the Minister of Public Instruction, the Director of Fine Arts, in a report dated May 7, enters upon a more detailed exposition of his views. The system of columns with but narrow interspaces between, that distinguishes the architecture of Sainte-Geneviève, presents grave difficulties in the way of continuous pictorial decoration. M. de Chennevières, however, proposes that by a sort of "illusion of perspective," the paintings on the wall shall be made to appear as if they passed behind the columns, so that one subject may be continued without break in several interspaces. This scarcely seems a felicitous mode of overcoming the difficulty, but its effect cannot well be judged until it is tried. Perspective illusions are generally reckoned rather childish performances, and it is strange that they should be resorted to in this vaunted effort of French art in the decoration of Sainte-Geneviève "où la légende de la patronne de Paris se combinerait avec l'histoire religieuse de la France."

AMONG the many projects formed by M. de Chennevières for the furtherance of art in France is one for the formation of a great National Catalogue of all the art treasures of that country. "France herself," he writes, "is profoundly ignorant of her riches; an inventory that will reveal them to her will not only flatter her just pride, but will enhance in the eyes of foreigners the lustre of our nation." The publication will contain: firstly, a descriptive and historical catalogue of all works of art in the national collections; and secondly, of all those in provincial and municipal museums. The churches, monuments, &c., of Paris and the provinces will also be catalogued. Carefully elaborated tables will indicate the artists and the localities cited in the work, and will furnish "the indispensable key to this immense repertory of works and names." The carrying out of this vast undertaking is entrusted to the following commission:—MM. Chabouillet (Conservator of the Department of Medals in the Bibliothèque Nationale), Chéron (Librarian of the Bibliothèque), Comte Clément de Ris (Conservator Adjoint of the Louvre), Jules Cousin (Librarian of the City of Paris), Vicomte Henri Delaborde (Member of the Institute, etc.), Edmond de Goncourt (writer on art), J. J. Guiffrey (National Archives), A. Gruyer (Inspector of Fine Arts), Georges Lafenestre, Louvrier de Lajolais, De Montaiglon, Paul Mantz, Michaux, Reiset, De Ronchaud, Servaux, Soulie (Conservator of Versailles), and De Watteville. The Commission will commence their work at once, and each chapter will be published as it is ready, not waiting until the whole is completed.

THE members of the Ramblers' Sketching Club have lately held their half-yearly exhibition of sketches.

A LOAN collection of mezzotinto proofs after Sir Joshua Reynolds may be seen at the Brasenose Club in Manchester. The catalogue contains some interesting information on the subject of Reynolds's sitters.

THE forty-first session of the French Archaeological Congress will be held on June 1 at Toulouse, and a programme comprising forty subjects for discussion has been drawn up. The *venue* is well selected. Toulouse can boast of several fine churches (among which that of St. Sernin is worthy of special mention, the restoration having cost 40,000*fr.*), some ancient cloisters, various beautiful houses of the Renaissance period, a museum of Natural History, which contains an almost unique prehistoric collection; and lastly, one of the most splendid museums of antiquities in all

France. One day will be devoted to a visit to the beautiful valley in the Pyrenees in which is situated Saint Bertrande-de-Cummings, an old Roman city and the capital of the diocese, and to the Grotto of Gourdan, where prehistoric remains of men coeval with the gigantic elk and the mammoth, have been discovered.

SIGNOR ALESSANDRO CASTELLANI, of Rome, has now in his possession a thin circular plate of bronze such as was worn hung from the collar by fugitive slaves. It bears on its side this inscription, with the Christian monogram at the beginning: *Tene me et revoca me in Foro Martis ad Maximianum antiquarium*. The forum of Mars—that is, of Augustus—was before known from the inscription on the Florentine codex of Apuleius as having been in the year A.D. 395 the residence of an *antiquarius* named Sallustius. Finding now Maximianus an inhabitant of this region, De Rossi (*Bulletino dell' Inst. corrisp. Arch.*, April 1874) supposes it to have been the regular quarter of those who were employed in transcribing and correcting MSS. of Latin literature, that is the *antiquarii*, as it was also the quarter of the *oratorii*, or professors of oratory in Rome.

IN the French Court, just opened, of the International Exhibition, is an interesting series of drawings, sent by the Commissioners for the Preservation of Public Monuments in France. When a monument is considered deserving of being restored, estimates, plans, and drawings are prepared, giving a full description of the edifice, and the nature of the repairs required. These works, executed by the first artists, are deposited in the archives of the Commission, and form a collection of the highest interest to art, amounting now to above 8,000 drawings. From these the Commissioners have made a judicious selection in those sent to the International Exhibition, giving specimens of all the styles and all the schools of architecture in France. As examples of the Imperial epoch, there is the Amphitheatre of Arles, and the Temple of Augustus and Livia at Vienne. In religious architecture, which naturally occupies a large share in the collection, as the master architects of the Middle Ages devoted their special talents to the building of churches and monasteries, there are drawings of the Cathedral at Laon, in the restoration of which 4,000*fr.* has been expended annually for the last twenty years; Queen Matilda's Abbey at Caen; the Calvary of Pleyben, work, as all those of Brittany, of the seventeenth century; the Jubé of St. Fiacre; the abbey-fortress of Mont St. Michel, with its "Merveille;" Vincennes, St. Denis, etc. Civil architecture is represented by Cardinal Granvelle's house at Besançon, the palace of the Dukes of Lorraine at Nancy, burned by the Prussians; the Houses at Orleans of Diane de Poitiers and Francis I. Military, by Amboise and Pierrefonds and the Visigoth fortifications of Carcassonne; besides examples of mural paintings from the Palace of the Popes at Avignon, of the school of Giotto, mosaics, etc.

The Commission have undertaken the publication of a part of their rich collection, and a first series of four folio volumes has already appeared.

Nor is the exhibition sent by the city of Paris, through the Prefect of the Seine, less important. The Directors of the Public Works of Paris furnish from each division (*service*) models and drawings. Bridges, sweeping and watering machines from the service of the public ways (*voie publique*). From the service of architectural works, models and drawings of churches, barracks, colleges, theatres, mairies, markets, fountains, etc.; and the Fine Arts furnish us with sculptures, paintings, tapestry, and painted glass windows. The second division, of Schools (*Enseignement primaire*), gives a beautiful model for a general school, with the workshop for the boys, all the tools most minutely rendered. The third division comprises hospitals; and the fourth, the direction of reservoirs and sewers. The whole exhibition is

very complete, and does credit to the delegates by whom it was organised.

M. BURNOUR, the director of the French school at Athens, is making progress with his excavations on the north-east side of the Acropolis, and reports the finding of a part of a statue resembling the Venus of Milo, and said to be of the best period.

DR. HEYDEMANN has resigned his post in the department of Classical Antiquities in the Museum at Berlin, and gone to Halle as Professor of Archaeology.

THE Académie des Beaux-Arts has elected M. Henri Delaborde as its *secrétaire perpétuel* in the place of the late M. Beulé. The unsuccessful candidates were MM. Jean-Baptiste Guillaume and Charles Blanc. M. Delaborde, a pupil of Paul Delaroche, has painted several well-known historic pieces and landscapes, and, besides being a contributor to the *Revue des Deux Mondes*, he published in 1864 a series of studies on the Fine Arts in France and abroad.

THE *Journal de Rouen* mentions a discovery in an hospital at Chartres of great interest to the art public. The authorities of the hospital, wishing to adorn the hospital chapel, requested the curator of the Chartres Museum to select from among the old canvases relegated to the hospital lumber-room those which, after some repairs, might be used for the purpose. The curator accordingly applied himself to the task, and found four of from 9 to 13 feet in height, strong enough to be hung up, and representing saints. He proceeded to clean them, and, while carefully washing them, noticed that new paintings had been laid over the more primitive ones. He removed the false beards and additional draperies, and finished by exposing to light four magnificent canvases of Veronese, which are said to be genuine *chefs d'œuvre*. The authorities of the hospital, not being able to make a present of these paintings, have lent them to the town of Chartres, and they are now placed in a favourable position in the museum, where they attract daily crowds.

WE understand that Mr. Cosmo Monkhouse has in the press some notes on the Royal Academy, which he has prepared for the guidance of uninstructed visitors to the present exhibition.

THE STAGE.

"BRIGHTON" AT THE COURT THEATRE.

MR. FRANK MARSHALL has done himself injustice in giving the title of "comedy" to his new play *Brighton*, produced at the Court Theatre on Monday night. As a whimsical and extravagant farce the piece has sufficient merits, but as a work of wit or of serious or poetic interest it is not entitled to consideration. The author announces that he has borrowed the main incidents of his story from an American play, and the author of the American play probably announced, or should have announced, that he drew his materials from one of the early numbers of the *Bibliothèque contemporaine illustrée*: for if Mr. Branson Howard is not a diligent student and imitator of the school in which M. Labiche, M. Lacour, M. Lefranc, M. Martin and M. Michel are notable proficient, his inventive faculty is an exotic growth in any soil other than the Boulevards of Paris. But the nature of his hero's amorous intrigues leaves little room to doubt that they were first presented on Parisian boards, that Mr. Howard thence transferred them to Saratoga, and that Mr. Marshall has now found place for them at Brighton. The process is roundabout, but the result appears to be eminently satisfactory, as the play moved a Whitsuntide audience to incessant laughter from first to last. And the heartiness of the mirth provoked by these productions is perhaps their only test; for the comedy is the democracy of poetry, farce is the anarchy of prose; and it is fruitless to seek for motives and a rule of action under a tempestuous mass of incidents, which succeed one another in

wild confusion, unchecked by ordinary laws of cause and effect, and which bear a strong resemblance to the contents of any four consecutive chapters in the works of Charles Lever or Pigault Lebrun or Paul de Kock without the air of verisimilitude sometimes affected by those writers. Sublimely unreal and fantastically impossible, Mr. Marshall's play will probably meet with still greater success if he is content to allow that it is simply an extravaganza, and to call it by some such name as "The Surprising Adventures of Mr. Robert Sackett and his friend Mr. John Benedict in pursuit of Love and Gallantry."

This Mr. Robert Sackett is a person compared with whom the libertine heroes of the Restoration dramatists were constant lovers. Every hour sees him at the feet of a new mistress, and hears him swear that the last is his only passion. The author has not thought fit to introduce more than four of the objects of his affection: the first being Miss Effie Remington, who has been brought to Brighton by a mysterious correspondence in a matrimonial paper; the second Mrs. Olivia Alston, a widow, ordinarily attached to Mr. John Benedict, friend and mentor of the volatile Sackett; the third Miss Virginia Vanderpump, daughter of a merchant staying at the Grand Hotel; and the fourth Mrs. Carter, the young wife of an elderly friend of Mr. Vanderpump. The ladies are inclined to smile on Mr. Sackett's suit until they discover they have all been equally favoured by him. Then they insist that their natural protectors shall fight him, and each of the natural protectors makes an arrangement by which the duty shall devolve on one of the other three. Finally, their cowardice is exposed, and the couples are reconciled, Mr. Sackett, for no apparent reason, bestowing his hand on Miss Remington. It is difficult to see why the number of his victims is restricted to four. The simultaneous recognition of the deceiver by the deceived, which ends the third act so effectively, would be still more successful and still more like the bustling terminations of a harlequinade, if a large number of abandoned damsels, say twelve, were to run from different parts of the forest and claim Mr. Sackett as their own. Nor is it easier to understand why the dramatist has introduced so many persons who are of less use to the action than the supernumeraries in a pantomimic "rally." If Mr. Marshall intends to devote his abilities to this sort of work, he would do well to remember that the best of his French prototypes never throw away a character, never lose an incident, and seldom waste a word.

The weight of the play fell on Mr. Charles Wyndham, who sustained the part of Sackett with vigour. But too much vigour has a tendency to overpower the airy and unsubstantial being to whom the buoyant style of Mr. Charles Mathews alone among English players would do full justice. The fascination of the man is his irrationality, his frank gaiety, his carelessness surpassing that of Captain Macheath, it being almost a matter of indifference to him whether "the other dear charmers" are present or absent. Yet the feeble efforts he pretends to make in order that his intrigues may be kept distinct, and his confusion when the four ladies call on him in rapid succession, and he attempts to conceal under his coat their handkerchiefs, gloves, cloaks and parasols, are rendered by Mr. Wyndham in the true farcical spirit, and it is due to the actor to say that the unflagging interest of the audience was mainly the result of his exertions. Mr. W. T. Hill was amusing as the eccentric merchant, Vanderpump; and Mr. Edgar Bruce was satisfactory as Jack Benedict. The ladies had little to do, and were equal to the demands made on their abilities. The dialogue was exceedingly brisk and more than worthy of the piece.

"MONT BLANC" AT THE HAYMARKET THEATRE.

MR. BUCKSTONE's ascent of Mont Blanc is not likely to prove as successful as his former ascent

of Mount Parnassus. But the new comedy of Messrs. Henry and Athol Mayhew has provided the comedian with a character that would have suited his earlier style, and it has the distinction of representing the Mont Maudit for the first time on the stage. The various points of Alpine scenery—glaciers and plateaux, aiguilles and arêtes, "icy spires of sunlit radiance" and "urns of silent snow"—are depicted with some fidelity. But the result is simply a panorama, and one begins to wonder why Mr. Buckstone does not explain the decorations with a wand in the manner of Albert Smith, and intersperse a few jokes and droll stories in the manner of Artemus Ward. Pictorial art has gained another victory over dramatic art, and the victory is the more fatal because the Haymarket Theatre has long been recognised as almost the last refuge of the persecuted muse, and has thus drawn to itself a select and somewhat fastidious audience, whose sympathies if once alienated will not be easily restored. The names of the authors raised an expectation of better things, and in the heap of picturesque details there are still traces of careful workmanship. The story and in some cases the language is borrowed from *Le Voyage de M. Perrichon*, which has received more of the flattery of adaptation than its merits would justify. The fault of the French play is that with little necessity it flagrantly violates the unity of place, carrying the spectators for half an hour from Paris to the Mer de Glace merely that M. Perrichon may be rescued from a crevasse by one of his daughter's admirers, may himself rescue the other, and may meet a belligerent officer of Zouaves, and then finishing the action, as it began, at Paris. Messrs. Mayhew have done wisely in confining the scene to the neighbourhood of Mont Blanc, but unwisely in burying under an avalanche of words the moral which gives zest to the original piece, that "avant d'obliger un homme il faut vous assurer bien d'abord que cet homme n'est pas un imbécile." Moreover, while the French authors have portrayed "un tout petit Mont Blanc et un immense Perrichon," the English adapters have dwarfed the man and magnified the mountain.

But the faults in the play which are most striking are that it is vulgar and intolerably wordy. The dramatists reject the opportunity offered by the grandeur of the surrounding scenery to introduce a touch of earnestness, a glimpse of pathos. "Là, où la nature entière exprime éloquentement un ordre plus grand, une harmonie plus visible, un ensemble éternel," they have nothing better to show than the lumbago of cockneys and the misadventures of a picnic. Elderly peers of the realm who call fathers "governors," and talk of "identical euphonious patronymics;" young noblemen who address ladies as "poppets" at their first meeting; fashionable physicians who remark that a wealthy tradesman is sprung from a mushroom source; young ladies who style themselves "fillies," and allow strangers to kiss their hands repeatedly in public places; and tradesmen who invariably mention their wives as "partners of their four-poster," are not perhaps impossible persons, but they are insufferable in a play of any pretensions. And besides the flood of turgid declamations and word-jingles consecrated by time which is poured over them, the events succeed one another so slowly that they become incomprehensible. One of the best scenes in the French play is where the astute lover, anxious to ingratiate himself with the father of Henriette, sends an account of M. Perrichon's heroism to the papers, and as the article is read aloud murmurs "trois francs la ligne." But the town-crier who awards to Mr. Chirpey, the English Perrichon, the thanks of the people of Chamonix, remains a mystery to the audience till the end of the play.

Mr. Buckstone, therefore, had no easy task in trying to afford amusement. Yet whether he disguised himself in Alpine hat, green veil and Tyrolean stomacher, whether he fell into crevasses or was taken out of them, he always managed to ex-

cite laughter. The rest of the Haymarket company are approved performers, and did their best to fill out the shreds of characters allotted to them. But the decorations of Messrs. Morris and O'Connor, arranged by Mr. Cue, were undoubtedly the most successful part of the representation; and it would not be just to omit mention of the manager of the lime-light, whose duty was to "beat the sunlight into flakes of fire," but whose name has not been made public. WALTER MACLEANE.

PAUL DE KOCK, being dead, yet speaks to the Parisian public. A posthumous drama of his, called *L'Amant de la Lune*, was produced at the Ambigu a few days ago. People went to be interested and went to be amused, but no one went, apparently, to be seriously critical. The play is a literary curiosity, of almost antiquarian importance, so entirely removed is the Paris of Paul de Kock from the Paris of our day. He never seems to have known this himself: no, not even in the least to have suspected it; though long after his retirement from Paris life and activity he lingered on, into the epoch of Cabanel and Francisque Sarcey—of Worth and Dumas *fils*. His conversation, they say, was of another age. He was like a *revenant* from 1830—the period at which people came up from the country to Paris to live like princes upon three hundred a year. He asked anxiously what people said of things at the cafés of his youth—insulted *demoiselles de magasins* by calling them *grisettes*, and gave the name of dandy to *gommeux* and *petits crevés*. What are you to do with a man who is so hopelessly behindhand in all things of importance? He and his play could hardly expect serious attention. They are happy perhaps to have provoked chiefly good-humoured laughter.

Mlle. DELAPORTE, the original representative of the heroines of *Les Idées de Madame Aubray* and *L'Ami des Femmes*, is coming back from Russia for a while, and will play at the Gymnase Theatre in the month of September.

MONSIEUR LAFONTAINE is going to Bordeaux next week, to play his now famous character of Mazarin in *La Jeunesse de Louis Quatorze*.

THE Odéon Theatre will be closed, as usual, from the last day of May until the first of September.

WE understand that the Paris Vaudeville will give M. François Coppée's new prose play during the autumn season. The poet has a piece in verse ready for the Gaité.

Bogatelle—Offenbach's new little piece at the Bouffes Parisiens—is successful. The music is pleasant, of course, and tuneful; the words are not without wit; and the acting is nearly all that comic acting should be. Mme. Judic, who plays the leading character, has a little voice, much art, and a very fair share of audacity.

THIS week Mlle. Favart has finished her engagement at the Princess's Theatre, and M. Got has begun his, which will conclude next Wednesday. Mlle. Favart has probably found herself somewhat embarrassed by the action of the Lord Chamberlain. She has had recourse to brief one-act pieces, of the kind unknown to the English stage, and the cultivated public cannot be displeased to have witnessed the performance of these. *La Nuit de Mai*, scarcely as effective as *La Nuit d'Octobre*—which might also surely have been given—demands, in its interpretation, the most finished skill, and, in the audience, great sensitiveness to the most delicate artistic effects. *On ne badine pas avec l'Amour* has perhaps put Mlle. Favart to a yet severer test. It is a test which, to speak frankly, she cannot easily bear—as far as concerns the earlier portion of the piece—but as she proceeds, the sense of her art acquires the ascendancy, and you feel at the end that it is a performance you would not wish to have missed.

M. Got made his appearance on Thursday in

Le Gendre de Monsieur Poirier—a comedy which owes much to the happy union of M. Jules Sandeau's constructive force with M. Emile Augier's power of characterisation and high literary style. But M. Got's part in it, excellently played as it is, is not reckoned among the artist's greatest creations. For that, we may look forward to *Mercadet* next Monday evening.

MUSIC.

THE second of the Summer Concerts at the Crystal Palace, which took place last Saturday, was devoted to French music. The programme, though varied, was by no means exhaustive even of the chief French writers; and it was somewhat surprising to note the total omission of such names as Grétry, Boieldieu, Onslow, Félicien David, Adolphe Adam and Halévy, while so many as four pieces by one composer (M. Gounod) were included in the scheme. The most remarkable number of the concert was, beyond all question, the selection from Berlioz's "Romeo and Juliet" symphony. This was not only most excellently performed, but is in itself so full of interest as to lead to the hope that Mr. Manns will give the whole work at one of the winter concerts next season. The ingenuity and novelty of the orchestration in the "Queen Mab" scherzo must be heard to be understood. Méhul's charming overture to *La Chasse du Jeune Henri* formed a most agreeable opening number to the concert, the other instrumental pieces being M. Gounod's "Funeral March of a Marionette," his new "Offertoire" from the Cecilian Mass, a violoncello solo by M. Lasserre, excellently played by the composer, and the overture to *Masaniello*. The vocalists were Madlle. Marie Roze, Mrs. Weldon, Madame Trebelli-Bettini, and "Monsieur" Agnesi—(Query, if "Monsieur" Agnesi, why not "Madame" Weldon?) This afternoon Signor Randegger's *Fridolin* is to be performed.

WE spoke last week of the first appearance of Madame Essipoff, on the 16th inst. Her subsequent performances have fully justified every word of the very high praise which we felt to be only her due. At her second performance, also at the New Philharmonic concert, she played Rubinstein's concerto in D minor and Liszt's "Rhapsodie Hongroise" in a manner which very few pianists could approach, and probably none surpass. Following the example of many other great pianists, she announced two piano recitals, the first of which took place on Wednesday last. Among the chief items of the programme were Beethoven's great Sonata, Op. 53, a selection from Bach's "Suites Anglaises," several specimens of Chopin, and pieces by Mendelssohn, Handel, Field, Leschetizky, Gluck, and Liszt. Space will not permit our entering into details of the performance; it must suffice to say that Madame Essipoff has unquestionably established her position here, as on the continent, as one of the first living pianists.

MR. E. H. THORNE gave a piano recital last Tuesday afternoon at St. George's Hall, with an excellent programme, among the chief items of which were Bach's Partita in G, Beethoven's Sonata in F minor (Op. 57), Bennett's Sonata "The Maid of Orleans," Schubert's Duet Variations on a French theme, dedicated to Beethoven, and Mendelssohn's four-handed variations (Op. 83A).

ON Monday last the St. John's College Musical Society (Cambridge), conducted by Dr. G. M. Garrett, gave their seventh concert, the programme of which was not only admirable in itself, but so extremely creditable to the society and the conductor, that we reprint it *in extenso*: Concerto in E flat, for two pianos and orchestra, Mozart; Sacred Cantata, "A Song of Victory" ("Israel's Siegesong"), Ferdinand Hiller; Overture, "Rosamunde," Schubert; Madrigal, "My Bonny Lass she smileth," Morley; Chorus, "Gipsy Life," Schumann; Song, "Zuleika," Mendelssohn; "Choral Fantasia," for piano, orchestra and chorus, Beethoven.

M. REYER, the musical critic of the *Débats*, gives in the number for the 24th inst. a long review of a new opera, *Le Cerisier*, which has appeared at the Opéra Comique. The composer is M. Jules Duprato, a former "prix de Rome" of the Conservatoire. M. Reyér speaks of the work as showing a practised hand; but his general judgment of the work is thus given. Speaking of the overture, he says, "It lacks only the flavour of a new idea, and unfortunately that which is lacking in the overture is not found elsewhere."

FROM the same authority we learn that four performances of Verdi's new "Requiem" for the death of his friend Manzoni, are to be given in the Opéra Comique—"a somewhat inappropriate place," observes M. Reyér, who asks if a catafalque will be placed on the stage, and wax tapers substituted for the foot-lights.

IT is said that Johannes Brahms is to be the Director of the School of Music in Munich. The post has been vacant ever since Bülow's departure from that city.

HERR JULIUS SCHUBERTH, the music publisher of Leipzig, has in the press a work of the greatest interest for musicians—a Theoretical and Practical Pianoforte School, in three volumes, by Franz Liszt. 7,000 thalers (1,050*l.*) have, it is said, been paid for the copyright, and it is expected that it will be a year before the work is in the hands of the public.

HERR JULIUS STOCKHAUSEN made his first public appearance as conductor of the Stern'sche Gesangverein at Berlin on the 18th instant, when Schumann's *Faust* music was performed.

THE first "classical" concert ever given in Constantinople has lately taken place, with very encouraging success. The programme included Beethoven's symphony in D; the overtures to *Figaro*, *King Stephen*, and *Lodoiska* (Cherubini), and songs from *Figaro* and Rossini's *Stabat Mater*.

THE *Signale* says that the Belgian violinist, M. Vivien, has been engaged for a concert tour in England.

Rubinstein's new opera, *Die Maccabäer*, has been accepted for performance at the Royal Opera, Berlin, and is to be produced next season.

HERR TAUBERT has composed a comic opera on the subject of Shakespeare's *Twelfth Night*, which is also to be produced next season at the same house.

WAGNER's *Tristan und Isolde* is to be given at Weimar on June 14, 17, and 21. The same composer's *Die Walküre* was performed at Munich on the 14th instant. King Ludwig was present on the occasion.

THE late well-known Councillor Franz Schott, of Mayence, chief director of the celebrated musical society of that city, has left a capital of 63,000 florins to be expended for the foundation of a musical school, or for the establishment and permanent dotation of a capellmeister's chair. He also leaves four large buildings at Mayence, which were originally designed for working men's tenements, to be held by the municipality in trust, and the rents to be appropriated for the benefit of the local poor-schools and theatres.

THE proprietorship of the little house at Vienna in which Mozart composed the *Zauberflöte* has been transferred by its late owner, Prince Starhemberg, to the International Mozart Association at Salzburg, who intend to reconstruct it in the Mirabell Gardens of the latter town, as a memorial in perpetuity of the great composer. An album will be placed in the building for the reception of portraits and autographs of poets, composers, and musicians, desirous of testifying their respect to the memory of the master, and this is intended to form a suitable pendant to the volume containing similar memorials of Mozart's artistic contemporaries, which will also be open to the public.

POSTSCRIPT.

THE *Times* states that, according to the latest news from Athens, the judges rejected on May 15 the demand of the Turkish Government for one-half of the treasure which Dr. Schliemann discovered at Hissarlik and conveyed to Athens. The arrangement now come to seems to be that Dr. Schliemann is to employ from 100 to 150 labourers for three or four months at Hissarlik, and that whatever is found by them is to be the property of the Turkish Government. In the mean time the Turkish Government has not been inactive. The large slabs on the road which were discovered at Hissarlik at a depth of 30 feet have been removed, and below that pavement a much more ancient pavement of large chalk-stone slabs has now been brought to light. While the stratum which Dr. Schliemann and other Euhemerists assign to Priam and his family extends only from 23 feet to 42 feet below the surface, these new excavations reach from 30 feet to 53 feet. Those who believe that there must be some kind of historical foundation for all mythological and epic poetry will have to assign this new stratum to Laomedon, Priam's father, whose Iliion was destroyed by Hercules "with only six ships and fewer men."

THE *Times* also states that Professor Mylonas, of Athens, has returned from Olympia, whither he had gone with the German Archaeological Committee for excavations. According to his account, there are certain objects and plans for excavation at the Temple of Jupiter, where the French on the occasion of the expedition to the Morea previously laboured; also at the declivity of Mount Kroneos, which the sacred wood Altis, with the stadium, the theatre, and the hippodrome, joins, where even Pausanias saw thousands of statues, and the remains of which are covered with so much earth, only one pedestal excepted, on which the footsteps of the statue that rested upon it can be seen, and whose inscription was published by Beulé. The rest are yet to be discovered, but will repay all cost, no doubt, by their value for the science and history of art.

"A carefully-done and exhaustive piece of work; the volume will be found useful to many."—*Nonconformist*.

FREDERICK WARNE & Co., Bedford Street, Strand.

TO BONA FIDE INVESTORS.

THE DIRECTORS of a PUBLIC COMPANY, the Head Offices of which are situate in the City of Manchester, having completed their arrangements, beg respectfully to call the particular attention of the public to their investment.

The concern, previously and for over twenty years, has been the property of one private gentleman, during which time it has been in active operation, and has returned very flattering profits, which profits will be considerably augmented by the introduction of additional capital. The Vendor having come to an arrangement with the present Company for that purpose.

As this is an undertaking of a substantial character, and one which cannot fail to return first-class Dividends on investments, it is requested that adventurous speculators seeking promotion money, and others bargaining in questionable concerns, will not make applications for participation; but to all who desire to secure a permanent income, from the humble investor of five pounds to the more fortunate one of five thousand, the Directors will give the fullest information; and they respectfully solicit such persons to write for Prospectuses immediately, to

THE SECRETARY,
2 and 4 ROCHDALE ROAD, MANCHESTER.

EVERY SATURDAY, and to be had, by Order of all Booksellers and Newsmen.

PRICE FOURPENCE.

THE

ACADEMY

A WEEKLY REVIEW OF

LITERATURE, SCIENCE, ART, MUSIC, AND THE STAGE,

Will contain:

REVIEWS and NOTICES of all important New Books, English and Foreign.

REPORTS of TRAVEL, EXPLORING EXPEDITIONS, &c.

ENGLISH LANGUAGE, ANTIQUITIES and FOLKLORE.

NEWS LETTERS from Foreign Countries.

CORRESPONDENCE between Literary Men.

PUBLISHERS' ANNOUNCEMENTS.

NOTES on the PROGRESS of SCIENTIFIC DISCOVERY in all branches.

CRITICISMS of the PICTURE GALLERIES, of the STAGE, and of MUSIC.

OPINIONS OF THE PRESS.

"The ACADEMY may fairly claim the first place among literary journals as the representative of the ripest and soundest English scholarship; and its criticisms of art, literature, music, and the drama are informing, incisive, and trustworthy. . . . It is hardly possible in a few words to give an idea of the excellence of this old journal in its new form, but every subject with which it deals (and it deals with many untouched by other papers) is entrusted to the hands of men who know what they are writing about, and the result is a freshness and fulness of information and an accuracy of judgment which commands confidence, and ministers to the intellectual satisfaction and pleasure of the reader. . . . The accomplished and scholarly dramatic critic of the ACADEMY, Mr. Frederick Wedmore, the novelist, whose theatrical notices are perhaps the best in style and the most trustworthy now appearing in any London journal."—*Manchester City News*.

"Our contemporary the ACADEMY has suddenly sprung into a great literary position, and is full of instructive and interesting matter."—*Spectator*.

"The ACADEMY, in its new and enlarged form, has a promising look. Its size is that of the *Athenaeum*, and the general arrangement of its contents does not differ much from that of its venerable and not too enterprising contemporary. The great distinction between the two is that the articles of the ACADEMY are signed. . . . It will be seen that there is no lack of strong names. But strong names will not of themselves float a new paper. The editing, the general tone, the make-up of it are more important, and of these too a good report can be given. . . . Altogether, the ACADEMY is very readable, and bids fair to be a formidable rival to the *Athenaeum*, which, for that matter, it might speedily and easily surpass in certain respects."—*New York Tribune*.

THE ACADEMY will pursue the purely practical aim of being a guide and source of information to all educated persons.

PUBLISHED BY

WM. GREIG SMITH, 43 Wellington Street, Strand.

LITERATURE.

Mohammed and Mohammedanism: Lectures delivered at the Royal Institution. By R. Bosworth Smith, M.A., late Fellow of Trinity College, Oxford. (London: Smith, Elder & Co., 1874.)

(First Notice.—MOHAMMAD.)

THE life and teaching of Mohammad will ever remain one of the most absorbing chapters in the world's history, and it need not be wondered that it has given rise to a very library of books. The older writers, who looked upon the phenomena of Mohammad's life as the result of the machinations of the devil, have given place (with one notable exception) to a new school, whose estimate, based upon the careful study of well-ascertained facts, is certainly far more favourable to Mohammad and more creditable to their own honesty and judgment. Yet these later writers differ greatly among themselves, not so much in facts as in inferences. Some go to the very opposite extreme to the mediæval libellists, and make Mohammad an almost perfect ideal of what a great man should be. Others, who are more alive to the perplexing contradictions to be observed in the Prophet's career, are anxious to attribute these contradictions to cataleptic insanity. Others, again, while acknowledging the blemishes, nay the huge stains, upon the man's character, maintain that his noble enthusiasm for a sublime truth was unfeigned, and even his crimes were less than other men subjected to his temptations would have committed. To this last class we think we may now add a writer who has embodied in a small volume of lectures a view of Mohammad's life and doctrines perhaps more faithful and more just than any that has before been published. Mr. Bosworth Smith brings to his subject the broad catholic views which we might expect in a Harrow master. It is true he does not pretend to any original learning: to judge from his book, we should say he was quite unacquainted with Arabic. But in this subject there is not now much need of original research. Sprenger has collected almost everything that bears upon the question of Mohammad's character and teaching. What is wanted is exactly what Mr. Smith possesses—a clear judgment, unfettered by a too dogmatic form of religious belief, and free from the cynical distrust of humanity which Sprenger occasionally manifests. We have the facts of Mohammad's life, and minutely circumstantial these facts are. All that is needed is the mind that can see the true meaning of the facts and grasp the complex character of the great man whose life they mark out, like the stones of a grand but intricate mosaic.

The object of the lectures is clearly set forth in the preface. "They are an attempt . . . to render justice to what was great in Mohammed's character, and to what has

been good in Mohammed's influence on the world." Mr. Smith has spared no pains in his endeavour to carry out this object. He has evidently studied all the principal works bearing on the subject, and has even accomplished the task of reading the Kur-án consecutively through several times. We wish, however, to add to the list of works in the preface one which throws much light on the details of Mohammad's life, and still more on his teaching—we mean the *Mishkát el Masâbih*, the only collection of traditions which has been translated into English.

The Lectures are four: Introductory; Mohammad; Mohammedanism; Mohammedanism and Christianity. The first lecture, though deeply interesting, we must pass over, in order to give our attention more fully to the second, on Mohammad. The third and fourth lectures we reserve for a second notice.

Mohammad may trust himself in the hands of this his newest exponent. Through all the long years that he has been before the world, the Arabian Prophet has rarely had a good word from a Christian. He has been "Antichrist," the "Arch-Impostor," and Heaven knows what; and the most earnest upholders of Christianity (or a form of it) in the East have vied in abuse or contemptuous pity of the founder of a religion which they deemed—*sancta simplicitas*!—diametrically opposed to their own. It is sad to contrast this well-meant but self-destructive abuse with the respect which a Muslim feels for *Sayyidnâ 'Isâ*, "our Lord Jesus, on whom be peace." Many years ago a Jew of Constantinople gave in his adhesion to the religion of Mohammad; and, thinking to ingratiate himself with the Muslims, began to blaspheme Christ. The impression produced was the reverse of what he had intended, and his head was immediately struck off. This act of summary retribution made a profound impression on the few Christians to whose knowledge it came; and it forms a golden link in the chain which binds Christians and Muslims together, and which was begun when Mohammad said, "*Say unto the People of the Scripture, Our God and your God is One.*"

A strangely-mixed character, this of Mohammad! And yet not strange; for what great character, with One solitary exception, is not mixed? If we would understand the life of this Son of the Desert, we must not start with the idea of a perfect man, still less of a consummate impostor: we must expect a man with everything on a giant scale—great and noble qualities, and overwhelming vices. As we have said, we think Mr. Bosworth Smith's estimate of Mohammad is a true one: the only fault we have to find is that he perhaps too much extenuates the sins of the Medîneh-phase of the Prophet's life. But this opinion needs some explanation.

Mohammad was a man whose whole soul was filled with a sublime idea, the Unity of God. He found himself in the midst of idolators, fetish-worshippers, wrangling Jews, and tritheistic Christians. Amidst all this corruption, he stood forth and preached the Unity of God, and the absolute resignation to Him of the wills of all men. He was supported by a few who, alone of all the

land, had kept their religion undefiled; who, indeed, were Mohammads without Mohammad's indomitable will and unquenchable enthusiasm for his cause, but for which that cause must have died. But the mass hooted him; his tribe laughed him to scorn. We cannot look upon him in his early days and say, This was an impostor. His was a nervous, excitable temperament, susceptible to influences too delicate for other men to feel. The fits to which he was subject bear witness to his highly-wrought constitution; and though we would not seek for an explanation of his mental phenomena in "cataleptic insanity," we yet think that the state of nervous excitement of which these fits were the outcome is the key to much of the "supernatural" in Mohammad. It requires no great stretch of imagination to believe that this weird man, wandering alone in the desert, should see things which men are not wont to see. It needs no imposture-theory to explain his distinct assertions of having seen visions, which he thought realities. *He did see them*: but they were the subjective creations of his own mind. His terror at the first vision showed it was no invention. In the early years at Mekkeh where was the motive for deception? A persecuted man, with a few friends whom he could count on the fingers of his right hand! The laughing-stock of his tribe—in danger of his life—on what conceivable grounds can we believe him to have carried on a designed series of frauds?

We hold, then, with Mr. Bosworth Smith, that during the early years of his mission Mohammad was an earnest enthusiast,—and we do not use this term disparagingly, for it is enthusiasm that keeps the earth from stinking,—and that he behaved nobly through those long years of persecution and failure. It would, perhaps, have been well for his memory if he had died in the cave of Thór, ending his life with one of his grandest utterances. Had he then died, we should never have had the sorrow of recording the many sins of his later years; and from first to last Mohammad would have been a splendid hero. But had he then died, the world would never have known him; his great thoughts would have perished with him; and El-Islâm would never have been.

We have seen the reformer struggling against untold hindrances at Mekkeh. But how was it with him after the Flight, when he had at last found sympathy and support at El-Medîneh? We must for a moment glance at the Prophet in his kingship, though it is a gloomy task. Still, let us remember that his sins were all of one kind. They lie on one ground. He was not cruel or implacable: he was no Napoleon. Speaking of his triumphant entry into Mekkeh, Mr. Smith says:—

"If ever he had worn the mask at all, he would now at all events have thrown it off; if lower aims had gradually sapped the higher, or his moderation had been directed, as Gibbon supposes, by his selfish interests, we should now have seen the effect; now would have been the moment to gratify his ambition, to satiate his lust, to glut his revenge. Is there anything of the kind? Read the account of the entry of Mohammad into Mecca side by side with that of Marius or Sulla into Rome. Compare all the attendant

circumstances, the outrages that preceded, and the use made by each of his recovered power, and we shall then be in a position better to appreciate the magnanimity and moderation of the Prophet of Arabia. There were no proscription lists, no plunder, no wanton revenge" (p. 94).

With the exception of one or two instances of needless severity, Mohammad's career was unsullied by the least taint of cruelty; and his treatment of his servants and of the lower animals shows him to have been a man to whom kindness and tenderness were natural, and cruelty foreign. Nor can we accuse him of a weak love of vainglory and pomp. His life was ever of the simplest, and he never lorded it over his followers. He has been accused of intense conceit; but except in the great stress which he laid on his mission or his high rank as a messenger of God, we confess we cannot see the grounds of the accusation. Many a tradition bears good witness to the contrary; and we wish we had room to quote but a few, if by so doing we could convince others as firmly as we ourselves are convinced of the utter absence of conceit and pretentiousness in Mohammad. No: the Arabian Apostle was not cruel, not conceited. As we have said, his sins lie on one ground, and that ground is sensuality. The subject is one which cannot fitly be discussed here; but the facts are indisputable. He took to himself more wives than he allowed to his followers; he induced his freedman and adopted son Zeyd to divorce his wife Zeyneb in order that he himself might marry her; and, worst of all, he made God his abettor, if not instigator, in all these things. This is the one great blot, and all the penknives of all the apologists will never erase it. If indeed we compare Mohammad's crime with David's, it must be confessed that the matter of Zeyneb was in itself far less criminal than the case of Bathsheba; for the husband, Zeyd, appears to have been an accomplice, and certainly was not made away with. But then David acknowledged his sin and repented, whilst Mohammad brings down a Súrah from God to justify his conduct. It is this that makes Mohammad's crime so black.

No: much as we wish, we cannot redeem the Arab Prophet from the charge of sensuality; but we insist that it was his *one* vice, in the indulgence of which he went even to the length of forging the high Name which he revered so deeply.

Mr. Bosworth Smith, whilst admitting the sensuality of Mohammad, yet seeks to exculpate him from the charge of defending himself by imposture. And it is true that there are strong arguments for his sincerity,—strongest of all his fervent faith in God and in his mission, which remained unshaken to the last. Mr. Smith brings much forcible reasoning to the aid of the Prophet, and we cannot do better than quote his words:—

"The change in his character and aims is not to be separated from the general conditions of his life. At first he was a religious and moral reformer only, and could not, even if he would, have met the evils of his time by any other than by moral means. . . . A religion militant is, as all ecclesiastical history shows, very different from a religion triumphant. The Prophet, in spite of himself, became, by the force of circumstances, more than a prophet. Not, indeed, that with him height ever begot high thoughts. He preserved

to the end of his career that modesty and simplicity of life which is the crowning beauty of his character; but he became a temporal ruler, and, where the Koran did not make its way unaided, the civil magistrate naturally used temporal means. Under such circumstances, and when his followers pressed upon him their belief in the nature of his mission, who can draw the line where enthusiasm ends, and self-deception or even imposture begins? No one who knows human nature will deny that the two are often perfectly consistent with each other. Once persuaded fully of his divine mission as a whole, a man unconsciously begins to invest his personal fancies and desires with a like sanction: it is not that he tampers with his conscience; he rather subjects conscience and reason, appetite and affection, to the one predominating influence; and so, as time goes on, with perfect good faith gets to confound what comes from below with what comes from above. . . . No man, whether prophet, statesman, or popular preacher, ever yet kept a prolonged hold over a mixed multitude without being in some measure degraded thereby. His teaching or his life must be accommodated to the average wants of his hearers, and not to his own finest insight" (pp. 90-92).

We should be thankful if Mr. Smith's argument, of which we have quoted but a fragment, had convinced us of Mohammad's sincerity in those clouded latter years; but we do not think it possible to vindicate the Prophet from the charge of what must at least be called forcing his conscience. Yet we can close our very inadequate notice of this most interesting, most eloquent lecture with the noble words of George Eliot:—

"It was the fashion of old, when an ox was led out for sacrifice to Jupiter, to chalk the dark spots, and give the offering a false show of unblemished whiteness. Let us fling away the chalk, and boldly say—the victim is spotted, but it is not therefore in vain that his mighty heart is laid on the altar of men's highest hopes."

STANLEY LANE POOLE.

The Poetical Works of Robert Buchanan. In Three Volumes. (London: Henry S. King & Co., 1874.)

THE task which Mr. Robert Buchanan has undertaken in these three volumes is not by any means light of its own nature, nor is it one to be lightly judged; for he has in no wise contented himself with a mere reprint of his poetical productions, or of such as he chose to reproduce. On the contrary, the work before us is of a far more ambitious cast. Mr. Buchanan has arranged his selected poems on an entirely new model; has given them, in many cases, new headings; and by dint of introductory verses, connecting links, mottoes, and the like means, has done his best to induce us to believe that the whole work possesses an inward as well as an outward unity, and is to be regarded as possessing a peculiar and quite extraordinary value on that account. He tells us in so many words that part of it at least might be called "The Book of Robert Buchanan," and he allows us to see pretty clearly that he intends the whole to be regarded in very much the same light. It is quite obvious that a proceeding of this kind is open to very serious objection. It is, to begin with, improbable that any arrangement of the kind will be more than approximately true; it is certain that it would be in any case better left to the

reader, and it is above all things objectionable, in that it introduces foreign matter into the region of things poetical, and tends to remove the work with which it deals from the operation of the one question of true poetical criticism, the question stated forty years ago by Victor Hugo, "L'ouvrage est-il bon ou est-il mauvais?"

That we may not fall into the same error with Mr. Robert Buchanan, it is necessary, in the first place, to consider what it is that he has thus placed before us, and in so doing it is convenient to adopt his own divisions. Of these there are some eight or nine. The first, "Ballads and Romances," consists of poems mainly classical or romantic in subject. In this, as in most of his other sections, Mr. Buchanan's principle of classification obliges him to neglect the one sound basis of arrangement—chronological order. But the result has this one merit, that it exhibits the author at his best and at his worst, and enables the reader to form at the very outset a pretty fair notion of what he has to expect. "The Ballad of Judas Iscariot," which stands second in the volume, is, we do not hesitate to assert, the high-water mark of Mr. Robert Buchanan's poetical performance. He has never done anything better, and he has very seldom done anything so good. It would not be fair to object that the subject is an unusually promising one, and unusually easy to treat, for it is possible to spoil the very best of subjects—how possible only the painful critic knows; and there is no spoiling in these verses:—

"The Bridegroom stood in the open door
And he waved hands still and slow,
And the third time that he waved his hands
The air was thick with snow.
And of every flake of falling snow
Before it touched the ground
There came a dove, and a thousand doves
Made sweet sound.
'Twas the body of Judas Iscariot
Floated away full fleet,
And the wings of the doves that bare it off
Were like its winding sheet.
'Twas the bridegroom stood at the open door,
And beckoned smiling sweet;
'Twas the soul of Judas Iscariot
Stole in and fell at his feet.
'The Holy Supper is spread within,
And the many candles shine,
And I have waited long for thee
Before I poured the wine!"

Nothing more effective than the monosyllabic feet in the line we have italicised could have been devised. But unfortunately the remaining poems of the section are very far inferior to this. With the exception of "Pan," which is really powerful and well written, there is hardly one of them which is not below mediocrity, and some are positively bad. The worst is perhaps "The Ballad of Persephone;" it is written in a style more ornamented and ambitious than Mr. Buchanan usually affects, and can only render its readers thankful that there is so little of it. A schoolboy of sixteen might very excusably write verses like the following; but there could hardly be an excuse for his republishing them:—

"One sunbeam swift with sickly flare
On white arms waving high did gleam,
What time she shriek'd, and the strong stream
Leapt up and grasped her by the hair.

And all was dark. With wild heads bowed
The forests murmur'd, and black cloud
Split spumy on the mountain-tops with fire and
portent loud!"

But the poems of this section are to be taken as illustrating only a casual phase of the grand subject, Mr. Robert Buchanan's mind. The division which follows, and which includes the greater part of the first two volumes, represents the matter on which he permanently occupies himself. These *Ballads and Poems of Life* are occupied almost exclusively with subjects drawn from contemporary low life, from the fortunes of Scottish peasantry, or of the haunters of London streets and alleys. Within these limits their range both of subject and merit is pretty wide. Many of them are little more than faint Tennysonian echoes of the "Dora" class, and of exceedingly little value from any point of view. Of these the "Scaith o' Bartle" is decidedly the best. Some of the shorter pieces, more lyrical in form, are good; such as the "Starling," and "The Wake of Tim O'Hara." The longest and most ambitious piece in the collection is "Meg Blane." It constitutes, with two London pieces, "Nell" and "Liz," the main strength of Mr. Buchanan's attack. The heroine—neither maid, widow, nor wife—dwells alone on the wild Scottish shore with her idiot son, supporting herself by fishing, active in storm and wreck, and always with a mixture of hope and fear looking, among the sailors whom fair or foul weather brings to the coast, for the father of her child. In the one waif saved, mainly by her energy, from a wreck, she finds him—only to discover that he is married and lost to her. They part with no violent demonstrations, but her heart is broken, and she dies ere long. This fable is a good one, and many readers, we doubt not, have been, and will be attracted by the so-called realism of the descriptions, the splash and spume of the storm, the interspersions of piety, and the just and never-failing pathos of a collapsed ideal. All these attractions—attractions be it noted of the matter mainly—we freely grant to "Meg Blane," but there our praise must stop. The fisher-hut, Meg Blane herself, her idiot son, her thoughts and ways, which a master would have given us in a few strong lines, adapted and adequate to the subject, are treated with endless fluency, so as to render quotation impossible. The storm, greatly as it intends, is full of false notes, and the metres, especially those of the first and fourth part, which consist of irregular choric stanzas, give evidence of Mr. Buchanan's deplorable insensibility to rhythm and harmony. The author explains his attitude with regard to the poems of this section clearly enough in an *Envoi* with which he closes his first volume. We may give two stanzas of it without comment for the present:—

"I do not sing for Schoolboys or Schoolmen.
To give them ease I have no languid theme,
When weary with the wear of book and pen,
They seek their trim poetic Academe;
Nor can I sing them amorous ditties, bred
Of too much Ovid on an empty head.
I do not sing aloud in measured tone
Of those fair paths the easy-soul'd pursue;
Nor do I sing for Lazarus alone,

I sing for Dives and the Devil too.
Ah! would the feeble song I sing might swell
As high as Heaven, and as deep as Hell!"

The remainder of the second volume is occupied by pieces entitled "Lyrical Poems," which consist chiefly of *juvenilia*, and can only, we should imagine, be introduced with the intention of relieving the serious matter of the preceding section. "Songs of the Terrible Year" follow, one of which, the "Apotheosis of the Sword," is good, and deserves to be quoted in part:—

"Then the children of men, young and old
Sat by the waters of gold,
And ate of the bread and the fruit,
And drank of the stream, but made suit
For blessing no more than the brute.
And God said, 'Twere better to die
Than eat and drink merely, and lie
Beast-like and foul on the sod
Lusting, forgetful of God!
And he whispered, 'Dig deeper again
Under the region of grain,
And bring forth the thing ye find there
Shapeless and dark; and prepare
Fire—and into the same
Cast what ye find—let it flame—
And when it is burning blood-bright,
Pluck it forth, and with hammers of might
Beat it out, beat it out, till ye mark
The thing that was shapeless and dark
Grown beautiful, azure, and sheen,
Purged in the fire and made clean,
Beautiful, holy, and bright,
Gleaming aloft in the light.
Then lift it, and wield!' said the Lord.

Choir.

Hark to the Song of the Sword!"

The volume closes with a series of sonnets placed to do duty as *Envoi*, but not now first published. We are glad to see, however, that one of their number, a woful ballad addressed to Mr. Browning's beard, has been suppressed.

In the third volume the fullest and latest development of Mr. Robert Buchanan's mind is unfolded. It begins with certain sonnets "written by Loch Coruisk" and containing the expression of a vague dissatisfaction with existing mundane arrangements. Then follows the "Book of Orm," wherein, as most persons who are likely to study these volumes are probably aware, its author's views on things in general are revealed in a series of visions. And last of all are placed "Political Mystics," poems various in form, but more or less agreeing in subject, and of singularly unsuccessful execution. As an appendix and key to the whole, Mr. Buchanan has subjoined a prose disquisition on something which he terms "Mystic Realism," and a couple of eulogistic reviews of the "Book of Orm" from the *Nonconformist* and the *Spectator*.

We have thus endeavoured to give an account, fair, complete, and tolerably sober and serious, of this very singular publication. No one who has not read it can appreciate the difficulty of keeping one's countenance during the process of perusal and review. Mr. Robert Buchanan is generally pretty much of an egotist, and we were prepared for a good deal of the personal pronoun. But the pitch to which his egotism has risen in these volumes is really something sublime. In the first place, the whole plan and conception of the work starts from the notion that every thought and idea which has passed through Mr. Buchanan's mind

is, of its own nature, important to the general welfare of the world. The intrinsic worth of the production matters not all—"puisque cochonnerie il y a, quand le Grand Lama a fait sa cochonnerie," why there is nothing left for an admiring public but to register the date of its arrival, and then receive it with adoration. No doubt the growth of a poet's mind is a very interesting fact in natural history; so is the growth of a periwinkle; but it appears to us that unless the poet's mind has produced good poetry, the history of its growth may as well be left untold.

Mr. Buchanan's "Mystic Realism" seems to resolve itself into a mysticism which is not at all real, and a realism which is not at all mystical. The former is displayed somewhat fully in the "Coruisk Sonnets" and the "Book of Orm." Vague aspirations and vaguer complaints, couched in language which is certainly misty if it be not mystical, always seem to command a certain audience, and to readers of this class Mr. Buchanan's work will doubtless be welcome. Perhaps it is because we are Saxon, and therefore "innocent of soul," that we fail to see the beauty or the rarity of it. Nothing is commoner in half-educated persons of variable temperament than the mood of hysterical exaltation and admiration at things in general which Mr. Buchanan seems to esteem so highly and consider such a special privilege. And though we are far indeed from considering ourselves worthy to be the spokesmen of that culture which our author so bitterly assails, we will venture to suggest to him two of the benefits which men of culture generally experience. In the first place, they are very cautious of mistaking muddled thought and casual impulses for profound philosophy and genuine inspiration; and, in the second, they are usually too conversant with good work to venture upon producing that which is bad.

As to Mr. Buchanan's idyllic work, we have less fault to find with his choice of subjects, but far more with his manner of handling them. He has, we think, fallen into the mistake, very common nowadays, of supposing that because a subject happens to be what would once have been deemed unpoetical, it must be good, and that any treatment of it however careless will do. This error is wont gradually and unconsciously to increase, till the subject alone comes to be thought of importance, and the treatment is left out of sight altogether. So that we are left in worse case than were our great-grandfathers; for the most sapless weakling of the school of Pope was bound to conform to certain rules and to come up to a certain standard, while the modern laureates of hangmen and prostitutes, of British deans and British matrons, are indulged in almost any amount of slipshod slovenliness, in virtue of the audacity or the morality, as the case may be, of their subject-matter. Now this is beyond all question utterly wrong. No doubt the arbitrary branding of certain subjects as poetical, and of certain others as unpoetical is quite unjustifiable; we will go further: we believe that all subjects without exception are admissible as subjects. To him who can make poetry out of them they are poetical; if any seem hope-

lessly intractable, the only conclusion to be drawn is that the right man has not yet tried his hand. But on the other hand a poet is to be valued, not because of his choice of subjects, but because of his treatment of the subject chosen. On Parnassus, as elsewhere, there are many mansions; they are open as well to poets who treat easy and commonplace subjects well, such as Cowper and Bryant, as to those who reconcile their readers to their choice of subjects repulsive and unfamiliar, like the author of *Songs before Sunrise*. But no such mansion will open to the singer who pleads the difficulties or the merits or the novelty of his subject in extenuation of the insufficiency or the inaccuracy of his treatment and his execution.

To such a plea Mr. Buchanan must in the end be reduced. Not only does his work abound in glaring violations of the simplest rules of language—in such deformities as “thou became,” “he didst,” “prone upon his back,” and the like: not only are his rhymes harsh and his metres ungainly, but he fails entirely in the higher and more general excellences of poetical expression. No poet of equal power known to us is less quotable, or has produced work less apt to stick in the memory. His mistiness of thought, joined to a fatal fluency which never stops to think twice, to point, correct, complete, or cancel an expression, renders his poems all but barren of jewels whether they be five or fifty words long. This combination of mistiness with fluency accounts for, if it does not excuse the total absence of any sign of revision in Mr. Buchanan’s reprinted pieces. It would be in most cases impossible to revise without rewriting them. Consequently, though Mr. Buchanan has in some places not spared the knife, he has omitted the necessary accompaniment of the file. And when the knife is used without the file, the effect is generally to dispose the reader to take up something very like the position of Wordsworth’s “wiser mind.” We are not at all disposed to mourn for what Mr. Buchanan has taken away, but we cannot help mourning very much for what he has left behind.

It is no light charge to bring against a poet, that he has forgotten entirely that he is, or ought to be, above all things an artist. But this is exactly what Mr. Robert Buchanan has done. In his hurry to be prophet, seer, politician, city missionary, and what not, he has neglected—in fact, he has wilfully despised—the art which nevertheless he professes. No doubt there is in his work plenty of that vague and delusive quality which is sometimes called power and sometimes promise. But in matters poetical, and above all in poems deliberately and systematically reproduced, we expect performance, not promise. With due study and due repression Mr. Buchanan might have turned out something not wholly worthless. But he has preferred, for some fifteen years, to clothe his crude thoughts in cruder language without hesitation or reflection, and now we fear that it will take more than his own immeasurable self-confidence, and more than the unintelligent laudations of certain critics, to make of him a great, or even a tolerable poet.

GEORGE SAINTSBURY.

Mary Queen of Scots and her Accusers. By John Hosack, Barrister-at-law. Vol. II. Second Edition. (London and Edinburgh: Wm. Blackwood & Sons, 1874.)

MR. HOSACK, having completed the investigation into the guilt or innocence of Mary with respect to the crimes laid to her charge at the Conferences held at York and Westminster, carries the narrative of her life down to the final catastrophe of her execution at Fotheringhay, in 1587, in the present volume. He also gives a clear and interesting account of such contemporary events on the continent as have any bearing or influence on the affairs of the Queen of Scots. He handles his subject with as much impartiality as it will admit, and points out with great ability and care the errors into which certain other writers have inadvertently fallen. The volume commences with an account of the negotiations at Chatsworth for the restoration of Mary to some portion of her authority in Scotland. The recent rebellions in the north, though unsuccessful, and the earnest remonstrances of the French Court, had shown to Elizabeth the great danger in which she stood by the detention of her rival, and she would have been only too glad to have got rid of her unwelcome guest, if she could have done so in any manner compatible with her own safety. Mr. Hosack therefore attributes the failure of these negotiations to the machinations of Burghley and his colleagues, who dreaded greatly any change whereby Mary’s prospect of succession to the English throne might be increased, and their own title to the estates which they had acquired during the recent changes imperilled. At the same time he is hardly correct in his statement that the project of a match between the Queen of Scots and the Duke of Anjou was a pure fiction of Walsingham. A despatch from the latter to Burghley, October 8, 1571, preserved in the Record Office, contains the portion of a letter from the Cardinal Pellevé, mentioning the great dislike that Monsieur had to the proposed marriage with Queen Elizabeth, and the great hope of one with the Queen of Scots. In addition to this the Catholic party in France were seriously alarmed at the prospect of the English alliance, and by making the grossest charges against the private character of Elizabeth, sought to disgust Anjou with the match; and at the same time, in order that his schemes of ambition might not be too rudely dispelled, insisted on the superior title to the Crown of England possessed by Mary. The failure of these negotiations was followed by others, having for their object the disposal of Mary by handing her over to her rebellious subjects, with the express understanding that she should immediately be put to death, which was only prevented by the unexpected death of the Regent Mar. The letters of Henry Killigrew, which are given at length in the Appendix, contain a full account of the different steps taken in this transaction. He had been despatched by Burghley with instructions to make careful overtures to Knox and Morton, before arriving at a definite understanding in the matter. With neither does he appear to have had the slightest difficulty; the veteran Reformer, sick as he was, immediately brightened up,

and expended almost his last breath in counselling and exhorting his fellow-subjects to murder their sovereign, whilst Morton engaged that on certain conditions the royal captive should be put to death within three hours of her arrival in Scotland. The account of the obscure intrigues in which Morgan and Parry were engaged will be read with interest, and the author does not hesitate to hint that means were used to cause the latter to make most damning confessions, which were used for his destruction, in the fear that afterwards he might make retraction. By far the most important portion of the book is that relating to Babington’s conspiracy. Mr. Hosack has gone with the greatest care through all the evidence connecting Mary with the plot, and whilst admitting her complicity in the design for the invasion of England, and obtaining her own liberty, makes out a very good case for believing her innocent of consenting to the proposed murder of her rival. He traces out the conspiracy from its commencement, and assigns with considerable probability its origin to Gilbert Giffard, an apostate Catholic, and one of Walsingham’s spies, and gives a curious account of the whole web of treachery spun by Walsingham and his colleagues for the purpose of involving Mary in the penalties set forth in the Bond of Association for the preservation of the life of Elizabeth.

Mr. Hosack charges Walsingham not only with being the originator of the plot, but, after showing how all Mary’s correspondence passed through his hands, accuses him of having forged and interpolated such passages in her letter to Babington as connected her with the scheme against the person of Elizabeth, and points out certain contradictions with the rest of the letter, which would be incomprehensible if the alleged interpolated portions were genuine. The evidence against Mary is further weakened and rendered more untrustworthy by placing the characters of Elizabeth and her advisers in the most odious light. The account of the negotiations with Philip of Spain for the surrender into his hands of the cautionary towns entrusted to the custody of Elizabeth by the Dutch as a guarantee for the repayment of the money advanced by her, is sufficient to stamp the memories both of the Queen and her chief councillor Burghley with lasting infamy. Mr. Hosack does not forget to mention the attempt on the part of Elizabeth to induce Sir Amias Paulet to dispose of her rival by private assassination, and so save her from any further trouble—and her loudly-expressed annoyance on finding her design thwarted by the conscientious scruples or astuteness of that gentleman. The tendency, however, throughout the volume is to throw most of the blame upon her advisers rather than on the Queen herself, for whose character for decision and ability the author entertains a very poor opinion. Her desire that some kind of torture more horrible than the law allowed might be devised for the punishment of Babington and his accomplices, which is not usually mentioned by her favourers, is rather strongly commented upon by Mr. Hosack, as is also her vacillation when the time actually arrived for her to get rid of her rival, and her per-

fidious efforts to thrust the responsibility on the shoulders of others.

The reader of the history of this period cannot fail to perceive that very shortly after the commencement of Mary's captivity the necessity for her destruction had become an article of faith with most of the politicians who had taken the cause of the Reformation as their basis of action. It was soon manifest, owing to the aggressive attempts of the Papacy to recover its lost supremacy in Britain, and the ambitious schemes of the Houses of Spain and France, that her liberty was incompatible with the security of Protestantism, whilst, owing to the Catholic reaction in England, her retention in captivity was almost equally dangerous. The uncertainty and insecurity caused by the constant plots produced by this state of affairs must have been almost unendurable; and it does not require much sagacity to understand that with men like Burghley and his colleagues slight scruples would be felt as to the means of bringing about the sole solution of the difficulty.

The awkward position in which the English Government stood with respect to their unfortunate captive was perfectly well understood on the continent; and as early as the commencement of this volume, during the negotiations for the marriage between Queen Elizabeth and the Duke of Anjou, Charles IX., when speaking of the Queen of Scots, had very significantly remarked that if he had been in Elizabeth's place he would have known what to do. With the ignorant and fanatical preachers of the reformed doctrines, both in Scotland and in England, howling for her blood, and the existence of dangerous and widespread conspiracies both at home and abroad, having for their aim the overthrow of the Government and the subversion of the present order of things, even if Mary had been innocent of every charge, the political exigencies of the times were such that her destruction sooner or later was inevitable. It is these facts, joined with the character of her accusers, which form the strongest claims of Mary to favourable consideration, and it is on them that her apologists must mainly depend.

In conclusion, Mr. Hosack having taken up his subject in a spirit of fairness, and used great care and research in the admission of his facts, has produced one of the ablest and most successful defences of Mary Queen of Scots which has yet appeared.

It is of course unnecessary to mention that Mr. Hosack entirely dissents from Mr. Froude's deductions; but it may not be out of place to point out a few passages where he joins issue on matters of fact, and has apparently the best of the argument. Space forbids giving the passages *in extenso*, but the reader will find some of them at pp. 288, 390, 493.

ALLAN J. CROSBY.

Slavonic Fairy Tales. Collected and translated from the Russian, Polish, Servian, and Bohemian. By John T. Naaké, of the British Museum. With Four Illustrations. (London: Henry S. King & Co., 1874.)

THE West Slavonian folk-tales still remain to be properly edited. In Russia great pains have been taken to place upon record

the legendary lore which in many parts of the country is fast dying out of the memories of the people; Servia was fortunate enough early to produce an enthusiastic collector of its songs and stories, Vuk Stefanovich Karajich; and Bosnia has quite recently put forth a collection of its popular tales, made by the Bosnian theological students at the College of Dyakovo, in Croatia. But the tales of Poland, Bohemia, and Moravia, and those specially belonging to the Wends of Lusatia, have as yet attracted little scientific attention. Various collections have been made, it is true, but they have never been methodical, they have not always been trustworthy. To many of the Polish and Bohemian legends an artificial splendour has now and then been added by means of literary gilding; the raw material supplied by rustic hands has been sometimes submitted by culture to a culinary process for which earnest story-comparers are by no means grateful. Still many genuine stories have been brought together in various collections, for a knowledge of which most scholars have hitherto been indebted mainly to Wenzig's excellent *Westslavischer Märchenschatz*. English readers now have an opportunity of becoming acquainted with eleven Polish and eight Bohemian stories, as well as with eight Russian and thirteen Servian, in Mr. Naaké's modest but serviceable collection of *Slavonic Fairy Tales*. Its contents are, as a general rule, well chosen, and they are translated with a fidelity which deserves cordial praise.

The Russian stories contained in the present volume are not very good specimens of their class. The "Snow-Child" is not a folk-tale, but a literary man's (or woman's) imitation of one. In genuine folk-tales it is not uncommon to find a babe developed, for the solace of childless parents, out of a pea, or a twig, or an egg, or the like. But a child made of snow, whose eyes "looked like two forget-me-nots," and who eventually "melted away and changed in an instant into a beautiful white cloud, rose up, and disappeared in the sky for ever," belongs not to the peasant's hut, but to the romancer's study. The "Story of Gol Voyansky" is a "chap-book" version of the well-known tale in which a killer of flies first pretends to be a hero, and then performs, or at least appears to perform, heroic feats. The gallant warriors who keep him company belong to the band of heroes who figure in the Russian *bylinas* or metrical romances, on which the compilers of the Russian equivalents for our chap-books have freely drawn. One of them, Eruslan Lazarevich, has been clearly identified with the Persian Rustem. The story of "Vasilisa with the Golden Tress," who is saved from an abducting dragon by her brother "Ivan the Pea," is a better specimen; but its chap-book origin is clearly proved by the fact—among others—that the double operation requisite for the resuscitation of a dead hero is slurred over in it, whereas great stress is always laid upon its two-fold nature in the genuine folk-tales. The same test may be safely applied to the story of "Little Simpleton," which, like that of "Ivan Kruchina," is a medley of various episodes taken from a number of independent

tales. The "Book of Magic" is in all probability a Western story of witchcraft which has made its way into Russia, and then become turned into a "soldier story." The legends of "Spirit Treasures" are curious if they can be relied upon, but the similarity between the cat which "crumbled into gold pieces," or the spectre which "crumbled into old copper money," and the well-known "gold men" of Buddhist moral fiction, is too close to be free from suspicion.

Some of the Polish stories bear manifest signs of literary handicraft. A belief in the malignity of an "evil eye" may exist in Poland, though it certainly does not flourish in any Slavonic land as it does in the South of Europe; but it could never have given rise, in a peasant's mind, to such a piling up of horrors as is exhibited by Wojcicki's story, of which a translation has been given by Mr. Naaké. There exists, it may be remarked, a German translation of Lewestam of Wojcicki's collection, but it is rare and little known. According to the story in question, a Polish gentleman had such evil eyes that all was blighted at which he looked, and so he was obliged to pass most of his time in regarding a bundle of pea-straw—that product of nature being comparatively insensible to bad looks. At last, however, he fell in love and married. After a time his wife began to wither under his too ardent gaze. In vain did he request her to extract his eyes, so he determined that he would by his own hands deprive himself of the power of blighting his expected babe. "Soon afterwards two cries, unlike in their sound, were heard in the house. The one—the joyful cry of a newborn infant, as it first saw the light; the other—the agonised cry of a man, the infant's father, as he parted with sight for ever! His eyes, glittering like two diamonds, lay on the ground by the side of a blood-stained knife." After this his life was everything he could wish. But an inquisitive servant, who knew what had taken place, one day, unfortunately for himself, dug up his master's eyes. "Suddenly they glared upon him like two live coals. As soon as their baneful light shone upon his wrinkled face, the old man shivered, fell down, and died." This sort of romancing is quite in the *Castle of Otranto* vein, and may please some minds more than the cruder monstrosities which occur in unmanipulated folk-tales.

Another of the Polish stories, that of the "Hare's Heart," is founded upon a genuine superstition, but it has been manifestly elaborated. The notion that a man's courage is subtly connected with his material heart is common to many peoples; among some of whom it is or was a common practice for a warrior to fortify or encourage himself by feeding upon the heart of a conquered bear or foeman. In the Polish story a converse operation is performed. A brave man's heart is extracted and a hare's put in its place. From that time forward he was far worse than chicken-hearted. So timid did he become that when, one day, a swallow which was flying past struck him on the head with its wing, "the blow was fatal the poor knight fell down as if struck by lightning, and soon afterwards died."

The Polish stories of "Carried away by the Wind," the "Demon's Dance," "the Plague Omen," the "Plague," the "Plague and the Peasant," and "Men-Wolves," are all closely in keeping with the superstition, though they are not told in the language, of the people. There is always a tendency in uncultured minds towards personifying an epidemic; in times of plague and pestilence the destroying force readily takes a human shape to anxious and unenlightened eyes. There is something mysteriously grand in these pictures, due to the popular fancy, of the onward sweep of the ghastly form of the Destroyer, accompanied by its terrible train. The word *Homen*, which occurs in a story called by a strange coincidence "The Plague Omen," is intended to express the noisy movement of this Pestilence-Procession, being akin to *gom* or *gam*, a confused noise, whence come *gomit*, to brawl, and a number of kindred words expressive of loud but inarticulate sound. The story of Madey is the well-known mediaeval legend of the criminal who is told by a dignitary of the Church that his sins will not be forgiven until a dead stick has become a living tree. Eventually the stick does become a tree and bears fruit, and the criminal is forgiven. In the Polish story, as the criminal confesses his crimes, the apples on a tree beside which he kneels turn into snow-white doves, and fly away—the last being "the soul of Madey's father, whom he had murdered." For some time the sinner cannot bring himself to confess his greatest sin. At last, however, he does so; the ultimate fruit flies away as a dove, and the pardoned penitent crumbles into dust. In this version the essential idea, that of the dead stick taking life, has been forgotten, whereas due prominence will be found given to it in the Lithuanian story (Schleicher, No. 26), which it in many respects closely resembles. In a Little-Russian version given by Afanasief (*Legendai*, p. 178), the tree bears a number of silver apples and two of gold. The fruits answer to the robber's crimes, the golden apples signifying his sins of patricide and matricide. He confesses to all but the last two, and so he dies while the golden apples still hang on the boughs, and "worse than all other sinners is he tortured in the lower world." Afanasief, in commenting on the Polish story, refers the apple-tree incident to old heathen ideas about the soul. Some critics may be inclined to refer it rather to the imagination of the literary reciter.

The Bohemian stories in Mr. Naaké's collection are specially interesting, inasmuch as they contain a good deal of genuine folklore respecting hobgoblins and water-sprites. To this day Slavonic rustics firmly believe that spirits, almost invariably of a malicious character, haunt pools and streams; and therefore those of their stories which deal with such beings are of a more original nature than those tales of Eastern origin which refer to seven-headed snakes and other Asiatic monsters in which they do not believe. In the story of "Lidushka and the Water Demon's Wife" a peasant woman consents to become godmother to a frog's child, and descends into the sub-aqueous world. In the palace of the frog-

demon (who answers to the Russian water-king), she finds a room in which stand "rows of little jars." She lifts them one after another, and out of each flies a white dove. These doves "were the souls of the unfortunate people whom the Water Demon had drawn into his power, and had cruelly drowned. Each soul had been kept in a separate dark prison, in the shape of a little jar. Lidushka was the deliverer of them all."

This is exceedingly picturesque, but, as in the case of the apple-birds, the white doves have a suspicious air. The idea has been worked out by Mr. Keightley in his *Fairy Mythology*. In the story of the "Soul Cages" Jack discovers that his friend Coomara the Merrow is in the habit of imprisoning in lobster-pots the souls of drowned sailors; so he secretly opens the "soul-cages," and releases their invisible inmates. To a subsequent edition of this (often-quoted) story, Mr. Keightley appended the following note: "We must here make an honest confession. This story had no foundation but the German legend in p. 259. All that is not to be found there is our own pure invention." We should like to see a conscientious edition of West-Slavonic (and many other) stories—with notes.

In the story of Lidushka, as well as in that of Yanechek, the Water Demon often takes the shape of "a beautiful red water-plant, floating on the top of the water." In both stories the souls of the drowned are imprisoned by the water-sprite. On the tricky spirit, who has inured the bad boy Yanechek, that boy's mother lays her hands, and ties him up in her cottage with a ninefold rope of bast. When Yanechek has been released from his prison-house he treacherously endeavours to kill the bound demon, but in his awkwardness merely cuts his bonds. The demon upsets a jug containing a few drops of water, which become "a strong flood, like a summer torrent among the mountains," and drown "the wicked Yanechek and his weak-minded, indulgent mother," whose souls are immediately potted by the Water Demon. No one can complain that the Bohemian tales are devoid of moral teaching.

The "Wicked Wood Fays" is a good story in itself, but it sounds much more like a Servian than a Bohemian tale. In Servia the Vilas really do (in popular belief) tear out the eyes of unwary mortals. It seems to be doubtful whether in Bohemia they ever behaved in a fashion so much more savage and unmeaning than that which characterises their sister spirits in other western and northern Slavonic lands. It is difficult to believe that in the land of the Czekhs there ever existed "a cave where there was a large heap of eyes, great and small, black, red, blue, and green," even although some of them may have belonged to owls and others to fish. Its locality may really have been further east, where the milder traditions of the Slavs became influenced by the fierce superstitions of the Turkish and Finnish races.

Of the Servian tales contained in Mr. Naaké's collection, we will not speak at present. But before taking leave of his

prettily got up volume, we ought to mention that its contents fully come up to the promise held out in its preface. The "flowers, plucked not for their scientific interest, but for the wild fresh perfume that clings about them," will justly give pleasure to many admirers who have not sufficiently cultivated their literary perceptions to be able to distinguish between the perfumes of the library and the field. To children, in particular, the book may be confidently recommended. The stories it contains are all the more suited for them in that they—with the exception, perhaps, of those from Servia—have been trimmed and pruned by able editors (but not by Mr. Naaké, who has worked quite honestly) before being exhibited to the public. To them also the illustrations (which they may recognise if they are well up in the periodical publications of the day) may prove quite as attractive as if they had been in the slightest degree true to Slavonic costume or Slavonic customs.

W. R. S. RALSTON.

Worthies of All Souls. By Montague Burrows. (London: Macmillan & Co., 1874.)

At the present time, when in the general reconstruction of endowments "the pious founder" usually "goes to the wall," special interest is attached to the history of a college like All Souls, which has retained its original character and resisted innovation more successfully than other kindred institutions. Mr. Burrows, as Professor of Modern History and fellow of the college, possesses a double qualification for the task he has undertaken. His facts are principally drawn from the college archives, which have been, as yet, scarcely touched for historical purposes, and he has succeeded in producing from these materials a most interesting and valuable book. The internal history of the college is itself interesting even to persons who have no connexion with it; and at some periods, as at the Reformation and during the Civil War and Commonwealth, the life of such an institution throws light on the life of the nation, and enables us to form a sounder judgment as to the progress and effects of the changes through which men were passing.

The college was founded in 1437 by Archbishop Chichele, the trusted minister of Henry IV. and Henry V., and was a combination of a college and a chantry. The forty fellows were to be men of learning, and a large proportion of them students of law; but their chief function was to pray for the souls of Henry VI. and his father, the founder, the English who had died in the French war, and for the souls of all the faithful departed. Nothing seems to have been done directly by the college in the way of education, except from the Reformation to the Civil War, when a few poor scholars were admitted. The grammar schools of Feversham, Berkhamstead, and other towns were, however—and we presume are still—under the supervision of the college. That an institution thus expressly founded for "superstitious uses" should have had troublous times at the Reformation was only to be expected, when other collegiate bodies

and monastic schools were swept away without mercy. The preservation of the college was accounted for by the University Commissioners of 1852 as due to the prominent place assigned in the statutes to the collegiate element, but Professor Burrows shows that the saving of the college was rather owing to the original exclusion of regulars from its fellowships, and to the necessity of retaining learned bodies for the benefit of the parochial clergy and the general culture of society. No doubt, also, Cranmer, who, as Archbishop of Canterbury, was visitor of the College, used his influence in its favour. It is needless to say that the College accepted readily the royal supremacy.

One lasting injury was sustained by the college at this period. The chapel was divested of its Popish adornments, and among these the *rededos* was defaced:—

"Every one of its fifty statues and eighty-six statuettes was thrown down and broken to pieces, while the projecting portions of the structure were chipped away till the whole was left a ruin. The altars were destroyed and the 'Lord's Table' placed in the centre of the chapel."

The destruction was completed in the seventeenth century, when the whole was made level, the niches being filled in with rubbish and mortar. Lath and plaster were then placed in front of it, on which Streater, Charles II.'s serjeant-painter, painted a fresco of the Last Judgment, which, as Evelyn says in his *Diary*, "was too full of naked for a chapel."

This fresco was subsequently covered by a painting by Sir James Thornhill, representing the Assumption of Chichele. Both these frescoes have recently been taken down, and Mr. Burrows describes the unexpected discovery of the ruins beneath them. All lovers of English architecture will be rejoiced to hear that this beautiful specimen of fifteenth century work is being restored to its original condition through the munificence of Lord Bathurst, and under the judicious hands of Sir Gilbert Scott.

During the Civil War and while Oxford was occupied by the king's troops, All Souls took a leading part on the royalist side, and gave up the whole of their plate for their sovereign's service. Mr. Burrows narrates at great length the occurrences in which the college was concerned, and takes several opportunities of showing the misrepresentations of Neal, the Puritan historian. He also revives the nearly forgotten story of the vow made by Charles I. to restore to the Church the impropriations held by the Crown, and other lands wrongfully taken from religious foundations. This vow was buried for thirteen years by Gilbert Sheldon, then Warden of All Souls, and produced after the Restoration at the suggestion of Duppa, Bishop of Salisbury, who was pained at the king's neglect of Church affairs. Mr. Burrows prints a letter from Duppa on the subject, and gives reasons for believing that the filling up of the vacant bishoprics, which commenced immediately after the correspondence, was due to the effect produced upon the king's mind by this unexpected revelation of the father's wishes. The changes in the college at the Restoration were not nearly so sweeping as at the Revolution. In

1648, Sheldon, the warden, was ejected, with a large majority of the fellows and servants who would not submit to the Parliamentary visitation. On the other hand, at the Restoration, most of the Parliamentary fellows kept their places. "None were ejected beyond that small proportion whose room was required for those who remained of the old ejected Royalists." But we must not pass over the internal history of the college without a few words.

This chiefly turns upon the struggle between the wardens, visitors, and fellows concerning the elections to fellowships. Before the college had existed a century, fellows sold their resignations, and managed to evade the oaths imposed by the visitors with the object of putting an end to this disgraceful practice. The battle was finally won by Archbishop Sancroft and Warden Jeames. The state of war in which the latter lived with his college is illustrated by extracts from his correspondence. Some of the moves made on each side are very amusing. At one election, when the fellows were very refractory at the warden's refusal to admit the nominees of those who had resigned, he ordered the commons to be served in "messes and chops," instead of in whole joints. Naturally the fellows were incensed, and retorted by formally desiring him to dismiss the cook and groom of the stable for being married men; a demand, which, although he had throughout based his position on the observance of the statutes, he was only able to meet by desiring the visitor to dispense with this injunction. However, at last he was victorious.

It would be impossible for any historical work to be produced in the present day without destroying some time-honoured belief; and Professor Burrows, anxious to vindicate the wisdom of the founder, disproves the old saying that fellows of All Souls are only required to be "*bene nati, bene vestiti, et moderate docti*." He states that

"the only authority for '*bene nati*' is '*de legitimo matrimonio nati*'—a common provision in college statutes. The words '*bene vestiti*' are not found at all, but seem to be taken from the statute that the fellows should dress as becomes the clerical order, '*sicut eorum honestati convenit clericali*,' and that when in Oxford or its suburbs they should wear the customary academical dress. The '*moderate docti*,' which was the unkindest cut of all, as conveying the idea of an unlearned body of fellows, was simply obtained by leaving out the remainder of the original sentence, and even for the words themselves there is no authority. The expression is '*grammatica sufficienter, et in plano cantu competent eruditi*.'"

But apart from the history of the College as a body, the book contains much biographical information concerning the Worthies of All Souls; such men as Sir Antony Sherley, the first English resident in Persia; Thomas Sydenham, the physician; Jeremy Taylor, Sir Christopher Wren, Christopher Codrington, the founder of the Missionary College at Barbadoes and the Codrington Library at All Souls, and other fellows who distinguished themselves in the public service and other ways.

C. TRICE MARTIN.

Le Neve's Pedigrees of Knights made by Charles II., &c. &c. Edited by George W. Marshall, LL.D., F.S.A., for the Harleian Society. (1874.)

PETER NEVE, or Le Neve, was an antiquary conspicuous for industry and honesty—a rare combination of virtues when heralds were wont to flatter their patrons with fictitious ancestry and to care more for fees than for research. Of his private life we know little more than that he was born in 1662, was educated at Merchant Taylors' School, became a Fellow of the Royal Society, and for some time acted as President of the Society of Antiquaries, which he helped to found. Some scurrilous verses accuse him of infidelity, but very likely he only possessed such a measure of scepticism as preserved him from becoming the dupe of impostures which befooled his brethren. He devoted his life and the fair abilities with which he was endowed to a study which, upon mature reflection, he pronounced to be one "which loads the memory without improving the understanding." We shall certainly not be careful to defend professional heraldry against this charge, though we may observe that the day is probably over when that which may form an interesting pastime is likely to take rank as a serious employment. At any rate, Le Neve's many works, incomplete as they are, have been the means of preserving numerous facts most useful to the historian and biographer, and we cannot say that in their collection his time was thrown away. They testify also to his love of truth, for we can ascribe to nothing else such plain-spoken entries as the following:—

"*Sr Henry Furnes, Merchant, Kted at the Hague, in the Bedchamber, Sunday 11 Octob' old stile 21 New stile 1691, for carrying the King the News of the defeat of the Irish at Lymerick. Md. he was an apprentice to a stockin-seller in the Exchange, and traded in poynt to Flanders, by which it is said he gott an estate. Sheriff of London 1700. Created the first baronet of Great Brittain by Patent dated day of June, 1707. no right to Arms.*" "*Rowland Lytton, Gent.*" (younger brother of Sir William, of Knebworth) "*vir admodum violentus et somnolentus.*" "*John Payne, esq', steward of the Charterhouse*" (son of Sir John Payne) "*he cheated the house of 4000^l circiter and lyes a prisoner for it in the King's bench.*" "*Thomas Brown, esq', Doctor of Physick, living 1699, an ingenious Gent., but afterwards gave himself up to drinking so much that he dyed by a fall of his horse going from Gravesend to Southflete in Kent, being drunk and sate up all night.*" "*Thomas Rawlinson, of the Inner Temple, esq', Helluo Librorum, an ingenious gentleman, unmar. 1715. Md. he spent most of his estate in buying books, some part of which he sold during his life by Auction 3 severall times. He freely confessed to me Peter Le Neve that his father had no right to the Arms used by him.*"

Tom Folio, it may be noted, was something more than a book collector, for, in spite of Addison's satirical remarks in the *Tatler*, there is good reason to believe that he was a well-read man and an able classical scholar.

Two Court doctors are thus disposed of:—

"*William Read, her Majesties oculist in ordinary, Kted at Windsor Castle 27 of July 1705 as a mark of her Royall favour for his great services done in curing great numbers of seamen and soldiers of Blindness gratis as the gazette said. Md. he was a montebank formerly and servant to Penteus, he was a harbour at Ashdon*

in Essex." "Edward Hannes, Doctor in Phisick and first Phisitian to the Queen Kted at Windsor Castle 29 of July 1705. Md. this man p'tends as I am told to supporters to Arms but I make great question whether he hath any right to Arms much less to supporters his father is said to have kept an herb shop in bloomsbury mercate."

Dr. Marshall appears to have exercised great care in preparing this volume for the press, but we should have been glad if he had explained to us the nature of Sir John Leigh's eminent service, to which Le Neve refers in these terms: "He carried up the dish of dillygroot at the Coronation of Queen Anne."

CHARLES J. ROBINSON.

NEW NOVELS.

John's Wife. By M. J. Franc. (London: Sampson Low & Co., 1874.)

"*B.*" *An Autobiography.* By E. Dyne Fenton. (London: Sampson Low & Co., 1874.)

The House of Raby. By Mrs. Hooper. (London: Henry S. King & Co., 1874.)

Lescar, the Universalist. (London: Chapman & Hall, 1874.)

A Chequered Life. By the Comtesse Solange de Kerkadec. (London: Henry S. King & Co., 1874.)

What Can She Do? By E. P. Roe. (Edinburgh: Edmonston & Douglas, 1874.)

Conquered at Last. (London: Sampson Low & Co., 1874.)

THERE is a game much in fashion at a certain sort of evening entertainment, which consists in one of the party drawing a sketch, and the others writing down their interpretations of it. This exhilarating pastime might be applied with some success to the titles of books. Given the name *John's Wife*, a picture of domestic bliss, of roses and babies in smiling profusion, is conjured up. But a serpent creeps into this Eden. The novel has a purpose, the tale a horror. John's wife, to put it shortly, though dowered with every charm that the novelist can bestow, was addicted to Rum. The work, in fact, is addressed to that numerous class whom their friends style "martyrs to delirium tremens." We might have thought that one awful example would suffice for one story, but we are given to understand that John's wife's brother and father are at least as intemperate as John's wife, and that John himself is by no means a pattern of sobriety. This is not all. John's eldest sister, whose diary is the source of our information about this convivial family, is herself a slave of the sin of gluttony. Her dinner is described on page 4, her breakfast dilated on at page 19, and she is as fond of chocolate as Mr. Mortimer Collins of rump-steak and Presburg biscuits. We doubt whether anyone could be edified by such a book as this, and we are suspicious of the value of the cure for drunkenness, which we are told "operated with success on the father of one of the most popular dissenting ministers in England."

It is a pity that B., who presents us with his autobiography, was not acquainted with the prescription recommended by Miss Franc. For B.'s mother was as fond of the wine cup—not that wine was her favourite

"vanity"—as John's Wife. She used to booze with a dissenting parson, who was a mixture of Stiggins, Squeers, and Uriah Heep. Poor B. used to think that his relative was subject to fits. "Fits be fiddled," said the charwoman. "It ain't no fit at all, not one bit of it. Why lawks, my lovey, the poor lady's only a bit tipsy; and what's the good of being a real lady, if you can't get fuddled without anyone interfering with you?" This specimen of B. may perhaps cause even the hardened novel-reader to "think twice, or even thrice" before he goes on with this dreary autobiography. Mr. Swinburne speaks of an artistic paradise where the lovely shapes of poet's fancies have real life and speech. The characters in B. have the air of shadows escaped from an artistic purgatory—distorted dim reflections of Mrs. Nickleby, of Copperfield's aunt, and the detestable father of Nancy. The book is as remarkable for bad English as if the author were the head-master of a great public school. We have not seen a worse novel than B. for many a day.

To take up the *House of Raby*, after the alcoholic fictions of B. and *John's Wife*, is a real relief. The novel is not a new one, but a reprint of a book which must be some twenty years old. It is curious to observe the slightly old-fashioned air which has already possessed it: the absence of slang, the composure and temperance of the style. The *House of Raby*, though not in the first flight of fiction, is a well-told and interesting story. The relations of the characters are improbable, but there is nothing harsh or strained in their conduct. A very painful theme is gently handled, and few things not of the very first merit are more touching than the clouding of Arundel's noble nature, and the resignation and constancy of Margaret. Lady Carleton, too, is, as the author says, "a true woman of quality," and deserves to have been immortalised by the pencil of Gainsborough. The touches by which a melancholy destiny is made to be felt to overhang the House of Raby, and the faintly indicated presence of the supernatural, are very nearly worthy of Hawthorne. As a matter of style, the constant introduction of French words is a thing to object to, and an evidence that the book is not exactly of to-day. It would be untrue to say that the story hurries the reader along with it; but it may be read, and that is much to say at present.

Lescar, the Universalist is a very odd and amusing book. It has many of the brilliant qualities of Ouida's work, and a good deal of the solid morality of the late Lord Lytton. The word Universalist does not mean a member of that cheerful sect, who, as the old woman told Clough, "expected every one to be saved," while she "looked for better things." Universalist, as applied to Mr. Victor Lescar, means a member of the International, and also what undergraduates call "an all-round man." Mr. Lescar had been brought up among visionary working men in Paris, thence he had gone to Heidelberg, and afterwards to Cambridge. His mother—like the mothers of so many great men—was a Campbell; his father a Radical officer in the French army. Naturally Mr. Lescar's views of life were catholic, and

his accomplishments varied. He could "harmonise on" Plato's *Crito*, on the piano, and he could win a two-mile race which was run in three laps. As he also possessed a bust of Mazzini, he was a good deal looked up to at Cambridge, where he belonged to a "council of twelve," young men, who lectured to each other on the Rights of Woman, Freedom, Spiritualism, and kindred subjects. He even won the affections of a freshman who had been brought up in Scotland, and who was a fair sportsman. Nothing can be funnier than the account of Cambridge, and the grave way in which the writer takes up the Mazzinian theories of the Lord Magnus Charters and the Broadbents of the period. As it was in the days of Pendennis, it is now, of course, and lads are prone to read Bastiat, and think they can set humanity to rights. But it is doubtful whether members of the "council of twelve" revere the late Prince Consort as the guardian angel of the International, and it is almost certain that the French artisans of the book are as impossible as the undergraduates are absurd. In another field the author is more successful: her Scotch scenes and pictures of Highland fishing must have been sketched on the spot, and the childhood of Donna and Piers might have been made as pretty as the childhood of Maggie Tulliver. But the writer was too anxious to get to the Cambridge running ground and the siege of Paris, and she has wilfully deserted the burns and lochs she seems to know and love. The Highland idyll is charming, the caricature of undergraduate philosophy—"that queer aping of sense and style"—is amusing, but all the Parisian episodes are theatrical and commonplace. The mere brutality of M. Léon Cladel's *Les Va-nu-pieds* deals more successfully with events too terrible and too near to be proper subjects of fiction. The writer admires Sir Noel Paton's picture, *Mors Janua Vitæ*, and her story has the same effects of pretentious sentiment.

A Chequered Life presents itself as the memoirs of the Vicomtesse de Léoville Meilhann. It is written with a gossiping and gentle dulness. The Vicomtesse lived under the First Empire, and her life was chequered by two marriages, and by one of those events which ladies call disappointments, by the loss of a fortune, and by seeing one or two ghosts of the old school. Besides these startling experiences, she possessed the acquaintance of Josephine, who told her some venerable anecdotes about her imperial husband. The book ends with the Vicomtesse's despair at the death of one of her lovers, a gentleman who had performed an operation on an abscess which had helped to chequer her life. It is a pity she despaired, as experience might have told her that lovers were numerous, and her feelings transitory. It is not easy to conjecture what motive the author may have had for writing this prosy fiction.

What Can She Do? throws a lurid light upon American manners. The author allows that his book has a definite, earnest purpose, and he has "tried to write earnestly, if not wisely." It is well to know one's limitations. The definite, earnest purpose of the tale is to warn young ladies, "society girls," who live "on Fifth Avenue," what a future

may be awaiting them. Though they belong to "old New York families," though they dine at six o'clock, and begin dinner with the popping of champagne corks, instead of a Christian grace, they may meet misfortunes which their education does not enable them to resist. When the fatal telegram of American novels comes in the midst of the giddy ball, when the father is smitten with apoplexy or paralysis, according to his constitution; when their lovers' intentions are therefore no longer honourable—how much better to be the accomplished Misses Hart, who can "teach drawing and colouring," than the fair but helpless Miss Zell Allen. This is the moral, worked out in the histories of the idle and industrious families of Allen and Hart. But do American young ladies really play cards and drink wine at night, alone with "young bloods from the city"? That flippant magazine, *La Vie Parisienne*, says so, and the Rev. E. P. Roe's evidence forms an "undesigned coincidence." Considered as a novel, *What Can She Do?* has little merit. The fate of Zell is too painful, and the Pious Black who plays the part of Caleb Balderstone, is disgusting, with his sermons, and use of the unctuous word "lub." Considered as a picture of life in New York, the book is very saddening indeed, and we sincerely hope that the author is little acquainted with the "wealthy old New York families," and the "society girls" there. Next time he writes, perhaps he will have found out some more subtle form of irony than that which inserts notes of interrogation after words like "Christian," "gentlemanly," and so on.

In one of Mr. George Macdonald's novels a morbid little boy is introduced, who is gradually wasting away under the mistaken belief that it is his duty to read through the romance of Ptolemy. We have often been reminded of this little boy, and his sad fate, as we struggled with the thousand and ten closely printed pages of *Conquered at Last*. Conquered at last ourselves, we gave up the task, somewhere in the jungles of the third volume. The author says that "this is his first essay in the novelist's art." It is difficult to believe that any one could write such a very bad novel all at once, and reach such depths without some gradual descent. As it is so, however, we say to him, as Homer said to the craftsman who wrought the belt of Hercules, "having fashioned this, never let him make another." The book begins in Irish scenery, and at first offers something of the animal spirits of Dr. Dasent, and Mr. Lever's tales. There are incidents in plenty: a titled lady who pours strychnine into the author's wine with a silvery laugh; another titled lady who poisons her husband with arsenic in mulled claret, as if mulled claret alone were not enough for a man of eighty-two; runaway horses which the hero stops by shooting them; forgeries, strifes, and man-slayings. New characters come in without introduction in every chapter. The solitary piece of humour in the book is the ethnological idea of an Irish lady, that there is some connexion between Shadrach and the O'Shaughnessys. The enormous work is much too epic to have any particular conclusion, and the hero leaves us to start off in search of "the husband of pretty Ellen," whoever she may have been, for she had not

appeared on the scene when we gave up the attempt to explore all the recesses of *Conquered at Last*. It is sincerely to be hoped that he will not inflict the narrative of his pursuit of pretty Ellen's husband on the pensive public.

A. LANG.

NOTES AND NEWS.

THE *Oxford University Gazette* of June 2 contains the following letter, which reflects the highest credit on the public spirit of Merton College:—

Merton College: May 27, 1874.

MY DEAR VICE-CHANCELLOR,—At a meeting of the Warden and Fellows of this College, held yesterday, I was requested to communicate to you the following resolution which it had passed:—"That the College give during five years an annual sum of 100*l.* in aid of the funds of the Bodleian Library in the event of three other Colleges declaring their willingness to do the same, and that the Vice-Chancellor be notified of this offer with a view to its publication in the *Gazette*."

I am, very truly yours,

R. B. MARSHAM.

We understand that a similar proposition was made at the Whitsuntide meeting at All Souls' College, but that it was rejected almost unanimously by the non-resident Fellows.

PROFESSOR LEPSIUS, the newly-appointed Librarian of the Royal Library at Berlin, has been sent, in company with an architect, on a mission to inspect the most perfect modern libraries in Europe, with a view to adopting all the really valuable improvements in the new building that is to be erected at Berlin. It would be most desirable to follow this example before determining whether the Bodleian Library at Oxford can be remodelled so as to answer the requirements of a nineteenth century library; or whether, as suggested in Captain Galton's most interesting report, it would be wiser at once to erect a new building that should be both safe against fire, which the present building is not, and capable of expansion with the increasing demands, not of the next fifty or eighty years, but of the next two or three centuries. There ought to be no difficulty as to funds. The Bodleian Library is one of the few truly academical institutions which has a claim on all the Colleges; and if the report of the University Commission should show that the wealth of the colleges is great, it should not be forgotten that the claims of the University are great also, and that, unless the academical endowments are carefully husbanded, instead of being scattered broadcast over the provinces, there will be no funds available for such emergencies as, for instance, the building of a new Bodleian Library.

THE Academy of Inscriptions has awarded its ordinary prize to M. Paul Meyer, for his memoir on the study of the dialects of the langue d'Oc in the middle ages.

A PADUA journal states that some unpublished sonnets by Petrarch have been discovered, which will be printed at the approaching sixth centenary of the poet's death.

VICTOR HUGO's *Quatrevingt-Treize* is passing through a ninth edition.

MESSRS. HENRY HOLT AND Co., of New York, have just published a *History of the Cretan Insurrection of 1866-7-8*, by Mr. W. J. Stillman, who was United States Consul at Canéa during the insurrection.—General Joseph E. Johnston, the only officer of the United States army above the rank of colonel who joined the Confederate army, who was commander-in-chief at Bull Run, and afterwards held the chief command in the West, and finally led the last organised army of the Confederacy, has published a narrative of military operations directed by himself during the war. General Johnstone by common consent stands second, and hardly second, to Lee alone of the Confederate generals. Messrs. D. Appleton and Co. are his publishers.

M. MILLER, member of the Institute and librarian to the National Assembly, has been appointed editor of the *Journal des Savants*, in succession to the late M. Beulé. The other candidates were M. Wallon and M. Berthelot.

MR. ROACH SMITH, F.S.A. &c., has sent to press an enlarged edition of his essay illustrative of Shakspeare's extraordinary knowledge of rural life. It will be printed by subscription, and subscribers' names may be forwarded to Mr. John E. Price, F.S.A., 53 Beresford Road, Highbury; or to the author, Temple Place, Strood, Kent.

AMONG Messrs. Longmans' books preparing for publication are: *Memoirs of the Civil War in Wales and the Marches*, by John Roland Phillips; a translation of Dr. Oswald Heer's *Primeval Life in Switzerland*, by James Heywood, F.R.S., F.G.S.; and a work on *The Rights and Duties of Neutrals*, by W. E. Hall, M.A. The same publishers will issue in the course of the present month the Alpine Club Map of Switzerland and the adjacent countries, on a scale of four miles to the inch, extending from Schaffhausen on the north to Milan on the south, and from the Ortler group on the east to Geneva on the west. The map will be in four sheets, and will be edited by Mr. R. C. Nichols, F.S.A., F.R.G.S.

THE Italian papers of the 25th ult. announce that a priest, D. Gaetano by name, has made the Great Hospital at Milan his heir, and is supposed to have died worth half a million of francs (20,000*l.*). He was a passionate collector of books, engravings, and paintings, and has bequeathed his library, amounting to above 35,000 volumes, to the city of Monza, with an annuity to defray the expense of maintaining it.

A COPY of Shelley's almost unknown "*Refutation of Deism: a Dialogue*," now belonging to Professor Dowden, of Trinity College, Dublin, is in the hands of the British Museum printed-book buyers, to see whether they will secure it for the nation. Of this little treatise Mr. W. M. Rossetti wrote in his Memoir to the *Poetical Works of Shelley* (Moxon, 1870): "Early in 1814 Shelley published *A Refutation of Deism*, a Dialogue between Eusebes and Theosophus, in 101 pages. Hogg gives a short quotation from it. . . he is the only author who mentions the pamphlet, and probably almost the only human being who ever owned or inspected a copy of it." The present copy once belonged to the Hookham family, to a member of which, Mr. Thomas Hookham, several of Shelley's early letters are addressed. See Lady Shelley's *Memoir*, p. 38. Sir Percy Shelley has another copy of the book.

WE learn from the Prussian *Staatsanzeiger* that Professor Max Müller has been elected a knight of the Ordre pour le Mérite, at the same time as Field-Marshal Count Moltke. This is the highest distinction in Germany. The number of knights is restricted to thirty, and when a vacancy occurs, a new member is elected by the chapter, and the election confirmed by the Emperor. There are also some foreign knights who enjoy the privilege of being allowed to wear their insignia at the courts of England, France, and Italy, without requiring special leave from their sovereigns. Mr. Thomas Carlyle and Mr. Humphrey Lloyd have lately been elected foreign members of the Ordre pour le Mérite.

A PLAN of Paris of an earlier date than any hitherto known has been discovered at Bâle, at the sale of the effects of a deceased Swiss gentleman of that city. It shows the buildings and houses in projection, like all old plans, and measures two metres by one metre forty centimètres. It is supposed to be at least as old as the year 1552. M. Jules Cousin, librarian to the city of Paris, has examined the map, and has had several photographs taken of the same size as the original, which will be distributed among the various public libraries of France.

MR. J. D. CAMPBELL, of Mauritius, has sent us a short Creole Catechism, from which we quote a few sentences to show how curiously French has changed in the island:—

"Demande: Qui ti faire nous, et qui faire nous euvre tous les jours?"

"Réponse: Nous Papa qui dans ciel, nous Seigneur qui tout sôl Bondié, dans ciel et la haut la terre.

"D. Est-ce qui Bondié faire tout qui chose?"

"R. Oui; Bondié faire tout; quand na pas Li, na pas là va yenna narien qui ti vivant.

"D. Quisentiments nous dévè yenna pour Bondié?"

"R. Nous dévè content Li, tout nous liquère [heart], tout nous naine, tout nous siprit, tout nous la force.

"D. Est-ce qui nous va vivre touzours la haut la terre à cote nous à présent?"

"R. Non, nous va quitte cine zour ça la terre là, et si nous bons, nous va vivre comment zanges dans ciel," &c.

THE *Spenerische Zeitung*, with an eye to possible contingencies, has, with grim facetiousness, inserted in its feuilleton a specimen of the cremation announcements, which in Germany doctors generally, and in this country Sir Henry Thompson specially, no doubt anticipate will be of ordinary occurrence among the coming race. The sample announcement is as follows: "To-morrow, at 3 p.m., I shall burn my mother-in-law.—AUGUST FEUERHAUSE."

DR. BRINSLEY NICHOLSON has undertaken to edit, for the New Shakspeare Society, a parallel-text edition of "*The Chronicle Historie of Henry the Fifth: with his Battell fought at Agin Court in France. Together with Ancient Pistol*," printed in 1608, and the *Life of Henry the Fifth*, from the first folio of Shakspeare's work of 1623. Dr. Nicholson will also edit a revised text of *Henry V.*, in old spelling, for the New Shakspeare Society.

PROFESSOR DELIUS has in type the whole of his edition of *Mucedorus*, 1598, a play formerly, though wrongly, attributed to Shakspeare. This will form the fourth Part of the Professor's series of *Pseudo-Shakspeare'sche Dramen*, and will be published at Elberfeld by R. L. Friedrichs.

THE Early English Text Society has just added to the list of institutions to which it sends yearly some of its texts for prizes, the first University in the Southern States of North America where English is systematically taught. This is the University of Mississippi, at Oxford, in the state of Mississippi, where Professor J. Lipscomb Johnson has a class of no less than sixty students in Anglo-Saxon, a class which, for numbers, the one professor of Anglo-Saxon in Great Britain, at Oxford (old, not new), probably never even dreamt of having in his wildest moments. We believe that, in the next century, there will be a professorship of Anglo-Saxon at Cambridge, in England.

PROFESSOR HIRAM CORSON, of the Cornell University, has just printed privately 200 copies of some "Jottings on the text of *Hamlet*: First Folio versus 'Cambridge' Edition." Professor Corson is a well-known supporter of the First Folio, and thinks that the Cambridge editors, in their big 8vo edition, "have certainly, in many cases, failed to recognise the superior merits of readings in the First Folio to those which they have introduced into their text from the Quartos and other sources." He has, however, been pleased to find that in their Globe edition the Cambridge editors have, on second thoughts, swung back from their heresies, to "Mother Church," the First Folio, in a large number of instances; and he publishes the present "Jottings" to help the Cambridge and all other editors and students of Shakspeare further along the right path. The Professor does not disdain to discuss stops, notes of interrogation, etc., and the changes of inflexion that the abominable system of modernisation has introduced into Shakspeare's text. Thus he says:—

"L. i. 40. 'By Heauen I charge thee speake.' F. 'by heauen I charge thee, speak!' C. 'speak' is an

infinitive after 'charge,' and not an imperative, as the C. makes it by use of the comma.

"L. i. 52. 'How now Horatio? You tremble & look pale.' F. 'How now, Horatio!' etc. C. The ? of the F. represents the elocution better. 'Horatio' should be uttered with an unequal upward wave, expressing the triumph of the speaker in the confirmation of his report of the appearance of the ghost.

"L. ii. 85. 'passeth show.' F. 'passes show.' C. The older form not only suits the tone of the passage better, but the two s's and the sh in 'passes show' coming together are very cacophonous."

THE appeal of the Hans Sachs monument committee to the members of Hans Sachs' craft has been responded to by contributions from 6,000 master shoemakers, who have sent in a donation of 1,000 thalers towards the expenses of the memorial.

MR. HALLIWELL has given the New Shakspeare Society the reference to an epigram on "The hated Fathers of vilde balladrie," which contains an interesting allusion to "The Mournefull Dittie" in Mr. Christie-Miller's Heber Collection, that in 1603 bade

"You Poets all, braue Shakspeare, Johnson, Greene, Bestow your time to write for Englands Queene."

The epigram-writer is savage with the balladers, and says:—

"... were I made a iudge in poetry,
They all should burne for their vilde heresie,"

which seems to lie in their profaning "great majesty," by writing of Elizabeth and James, and also in slandering their time. The only writer that he allows any credit to is the following:

"... he that made the Ballads of 'oh hone,'
Did wondrous well to whet the buyer on."

These, we suppose, are some lost political ballads, and do not include the ballad with the burden, *oh hone*, in the Pepys, Roxburghe, Bagford, and Douce collections, of which Mr. Chappell prints the tune and some words in his *Popular Music*: "A mournful Caral: or an Elegy lamenting the tragical ends of two unfortunate faithful Lovers, Franklin and Cordelius; he being slain, she slew herself with her dagger. To a new tune called *Franklin is fled away*:"—

"Franklin, my loyal friend, O hone, O hone!
In whom my joys do end, O hone, O hone!"

Be this as it may, the allusion to the *Mournefull Dittie* writer is as follows:—

"Some dare do this; some other humbly craues
For helpe of spirits in their sleeping graues.
As he that calde to Shakspeare, Johnson, Greene,
To write of their dead noble Queene."

The epigram will be printed in the first part of the New Shakspeare Society's *Allusion-Books*, edited by Dr. Ingleby.

DR. GASQUIT has reprinted from the *Journal of Mental Science* some papers on the madmen of the Greek Theatre. The subject is suggestive, but he spends nearly all his time in approaching it. The best thing is the commentary on the treatment of the mad father in the *Wasps* of Aristophanes, and the remark that madness was not common enough to be treated in literature before the period of the tragedians.

M. CARO has some solemn and, in the main, appropriate, though rather obvious remarks to make upon the effect that the spread of positive ideas is likely to have upon serious imaginations. He makes them *à propos* of the poems of a M^{me}. Ackermann, whose regrets and blasphemies seem less musical and less eloquent than Mr. Swinburne's, without being more ingenious or convincing. He holds that the complete dominion of the new ideas, if it should ever be established, will be less favourable to poetry than the present period of transition—which is not improbable, though put too absolutely.

AFTER an interval of more than a year, the appearance of another volume of the *Pückler Muskau Biography*, by Ludmilla Assing, has again drawn the attention of the reading public

to the life of that eccentric man, who, although alive till 1871, seems to belong very much more to a past than the present age, so completely out of date seem his *Tutti Frutti*, his *Diary of a Disconsolate Departed*, and the numerous other productions by which he attracted the attention of the last generation to his restless eccentricities and his wandering erratic mode of life. The geniality of the man, his enthusiastic love of art, and the freshness and impressibility of mind and intellect which he preserved to extreme old age, his strong artistic appreciation of all that was beautiful in nature, and his unremitting efforts to create and foster an aesthetical feeling in the world around him, claim for him a distinctive place among other men of his times and station.

THE completion of the Arndt memorial at Bergen may now be speedily anticipated, as the operations which had been suspended for want of the necessary funds are again being carried on, although simply, it must be owned, as a matter of speculation on the part of a local builder, who hopes when the monument is completed to secure the pecuniary returns which have hitherto failed, when appeals have been addressed to the patriotic feeling of the poet's countrymen. At Berlin a concert is announced for the purpose of aiding the Arndt fund, and as the poet's second home was within the Rhenish frontiers of the German empire, we may hope that this appeal will not be in vain.

AT the meeting of the Asiatic Society of Bengal, on January 7, Mr. C. Brownlow, of Kachhar, gave a "Description of a Bachelors' Hall among the Mikir Tribes, Assam, with certain symbols connected therewith," which is printed in the Proceedings of the Society. The hall, which is used as the habitation of the unmarried young men and boys of the village, "is well built, and stands on piles like the rest, and is matted with the wild bamboo turza, or matting made of the bamboo beaten at the joints until well split, and then opened out. . . . There is a front stage to the hall which is reached by a wooden ladder consisting of a log with recesses cut for the foot." Mr. Wallace, in his *Malay Archipelago*, mentions the institution of bachelors' halls among the Dyaks of Borneo, these halls being also used as lodgings for strangers and general council chambers; and it appears that the same institution still exists in one or two Oráon villages in the neighbourhood of Ranchi.

THE admirers of Leopardi, of Shelley, of Rich-ter's "Dream," of picturesque melancholy, sonorous despair, and the sombre philosophy which finds moral consolation in atheism—may be interested to know of a really remarkable poem, lately published in four numbers of the *National Reformer* (March 22, April 12, April 26, and May 9). The spirit of the work is akin to that of Leopardi, but the writer (who uses the signature B. V.) has thought out his philosophy of the universe in more detail, and presents it by the help of wider range of illustration and imagery. The versification in places recalls Shelley more nearly than any other well-known author, but it is only a passing resemblance of the sweet, fluent cadence, and in the greater part of the poem (about 1,500 lines) the originality of the writer is as unquestionable as his power. The work is called *The City of Dreadful Night*, and is simply a series of visions representing the despair of minds doomed by their own constitution to revolve, through a dark dream-like life, round the ruined shrines of "dead Faith, dead Love, dead Hope." But the poetical merits of the whole are quite out of proportion to the truth or morality of the general thesis. The following stanzas are near the end: a shorter quotation would hardly do the author justice:—

"I sat me weary on a pillar's base,
And leaned against the shaft; for broad moonlight
O'erflowed the peacefulness of cloistered space,
A shore of shadow slanting from the right:

The great cathedral's western front stood there,
A wave-worn rock in that calm sea of air.

Before it, opposite my place of rest,

Two figures faced each other, large, austere;

A couchant sphinx in shadow to the breast,

An angel standing in the moonlight clear;

So mighty by magnificence of form,

They were not dwarfed beneath that mass enorm.

Upon the cross-hilt of a naked sword

The angel's hands, as prompt to smite, were held;

His vigilant intense regard was poured

Upon the creature placidly unquelled,

Whose front was set at level gaze which took

No heed of aught, a solemn trance-like look.

And as I pondered these opposed shapes

My eyelids sank in stupor, that dull swoon

Which drugs and with a leaden mantle drapes

The outworn to worse weariness. But soon

A sharp and clashing noise the stillness broke,

And from the evil lethargy I woke.

The angels' wings had fallen, stone on stone,

And lay there shattered; hence the sudden sound:

A warrior leaning on his sword alone

Now watched the sphinx with that regard profound;

The sphinx unchanged looked forthright, as aware

Of nothing in the vast abyss of air.

Again I sank in that repose unsweet,

Again a clashing noise my slumber rent;

The warrior's sword lay broken at his feet;

An unarmed man with raised hands impotent

Now stood before the sphinx, which ever kept

Such mien as if with open eyes it slept.

My eyelids sank in spite of wonder grown;

A louder crash upstartled me in dread;

The man had fallen forward, stone on stone,

And lay there shattered, with his trunkless head

Between the monster's large quiescent paws,

Beneath its grand front changeless as life's laws.

The moon had circled westward full and bright,

And made the temple-front a mystic dream,

And bathed the whole enclosure with its light,

The sworded angel's wrecks, the sphinx supreme:

I pondered long that calm majestic face

Whose vision seemed of infinite void space."

THE main argument of Mr. Wallace's very curious papers on "Modern Spiritualism," in the *Fortnightly Review* (May and June) seems to be that, as the "facts" of Spiritualism are, according to the spiritualist theory, *sui generis*, men of science beg the very question at issue when they refuse to be convinced by evidence of a peculiar kind tried by peculiar canons. For the physicist "to ask to be allowed to deal with these unknown phenomena as he has hitherto dealt with known phenomena, is practically to prejudge the question, since it assumes that both are governed by the same laws." This is candid, but not easily reconcilable with the other claims which Mr. Wallace puts forward as to the thoroughly scientific character of the spiritualist theory. His other complaint against those writers who have professed to investigate spiritualistic phenomena, and have gone away convinced that there was nothing in them except delusion, self-deception, or conscious imposture, is that they have gone away too soon: Lord Amberley attended five *séances*, and remains unconverted; but Dr. George Sexton, M.D., M.A., LL.D., having attended *séances* and other means of enlightenment during fifteen years, at the end of that time was convinced, and actually rewarded by the development of mediumistic power; and in general Mr. Wallace has observed that the degree of conviction is "approximately proportioned to the amount of time and care bestowed on the investigation." He does not seem to suspect that this fact might be interpreted the other way, as showing that nothing less than a predisposition to believe in the theory is sufficient to induce the inquirer to prolong *prima facie* unprofitable researches. As to the evidence attainable, he admits that there have been cases of imposture, but denies that this fact ought to prejudice the candid against similar cases where imposture has not been proved; he thinks every witness should be assumed competent and honest

until proved the reverse, and does not scruple accordingly to fill his pages with startling incidents from a variety of sources, which he can have had no means of testing and verifying in detail. In fact, he ends by asking his readers to "look rather at the results produced by the evidence than at the evidence itself as imperfectly stated" in his articles. The evidence has sufficed to convince "sceptics of every grade of incredulity, men in every way qualified to detect imposture or to discover natural causes,—trained physicists, medical men, lawyers, and men of business;" and, of course, if the question could be decided by authority, it would be enough to say that Mr. Wallace himself is convinced; but then, what of the much greater number of sceptical, trained men of science who are not merely unconvinced, but distinctly and, as they believe, rationally, persuaded of the futility of the great mass of the evidence put forward? The greater part of the second article is devoted to the subject of "spirit photographs," that is, appearances in an ordinary photographic plate or print not answering to any object within the focus of the camera visible to ordinary observers. These appearances sometimes consist of patches of light, and in this case, as Mr. Wallace observes that "sometimes twenty consecutive pictures produced nothing unusual," a sceptic might think a flaw in the twenty-first was not an altogether supernatural accident; sometimes, however, the photograph shows more or less clearly an additional human form, sometimes a face, recognisable as that of some departed friend or relative; and here again scepticism, remembering the Tichborne trial, will suggest that a bad photograph may be thought surprisingly like a great many very different, faces. The kind of evidence which we imagine to be wanted is not more or better spirit-photographs, not more numerous histories of a sunflower with earth about its roots tumbling through the ceiling, or of musical instruments that serenade Mr. Home, coupled with a belief that these phenomena are produced by "spirits," i.e. otherwise unknowable "intelligent causes." The hypothesis of an intelligent cause hardly satisfies the mind while the nature of the effect remains so extremely indistinct. The entities represented in Mr. Wallace's photographs have the power of reflecting the sun's rays; they have, therefore, a physical existence, and it would be easier to ascertain a few more facts about their physical constitution than, let us say, to determine the substance of the sun. So, again, it would be interesting to know whether the sunflower is an instance of "spontaneous generation," or whether it is transplanted from some other spot of earth; if the latter, by what steps it passes through the ceiling, whether the joists and plaster open, or whether the spirits enable the two solid bodies to occupy the same space simultaneously. Granting the phenomena, these details are of the greatest importance and interest; Dr. Bastian might prove to be a "medium" through whose agency the spirits produced Bacteria. But this is not the direction in which Mr. Wallace seems inclined to lead enquiry. He accepts the present appearances as final, and only proceeds to group them with the Greek oracles, the miracles of Christ and mediæval saints, tales of witchcraft, and the "white-sheeted ghost" of popular faith—as things strange but true, now for the first time correctly explained. George Müller, the founder of the large orphanage supported by voluntary contributions received in answer to prayer (this is his own history of the matter), is, according to Mr. Wallace, a favourite of benevolent spirits who go about persuading the living benevolent to send him the requisite assistance. The superior simplicity of Müller's hypothesis would be a recommendation even in non-theistic circles.

In *Macmillan* Professor Goldwin Smith endeavours to alarm the Liberals as to the danger to which the principles of free constitutional government would be exposed by the extension of

the suffrage to women. Like most alarmists, his reasoning is a little incoherent, and he does not explain the grounds of the assumption upon which his terror reposes—that women, if enfranchised, will not only all vote wrong together, but will uniformly outvote the men who vote right, so as to have the real direction of the State. His strictures on the unhistorical nature of some of Mr. Mill's reasoning on the "subjection of women" are sometimes just; but, after having very judiciously disclaimed all intention of discussing anything so impalpable as the "natural rights" of woman, he relapses into a discussion of the scarcely less obscure subject, her "proper sphere."

Fraser contains a reprint of Mr. Sayce's lecture on Assyrian Discoveries, delivered in January at the London Institution, to which we referred at the time; and a very pleasantly-written remonstrance, by Mr. Leslie Stephen, addressed to Mr. Ruskin's recent writings, which, in spite of the painfully-exaggerated despondency of their general tone, contain bits of brilliant invective which ought not to be lost to the world through the author's fancy for publishing "his works in such a manner as to oppose the greatest obstacles to their circulation." For instance, there is a statue, in black and white marble, of a Newfoundland dog at South Kensington, "the most perfectly and roundly ill-done thing" which Mr. Ruskin has ever seen produced in art. Its makers had seen Roman work, and Florentine work, and Byzantine work, and Gothic work; and misunderstanding of everything had passed through them as the mud does through earth-worms, and here at last was their *worm-cast of a production!*

MR. FREEMAN's article in *Macmillan* on the "Buildings of Rome" is remarkable for a paragraph on the little-known capitals which he describes as of singular splendour and singular interest, which lie neglected among the ruins of the Baths of Caracalla. The artist has been so far from confining himself to one prescribed pattern either of volute or of acanthus leaves, that he has ventured to employ vigorously carved human or divine figures as parts of the enrichment of his capitals. Among the stores of fragments which lie in the lower gallery of the Tabularium there are a number of capitals which go even further, capitals of which the volute is formed by the introduction of various animal figures. . . . In these capitals, some at least of which, if not "classical" are certainly pagan, we get the beginning of the lavish employment of animal figures in Romanesque capitals. In Praetextatus' temple to the Dii Consentes, erected under Valentinian, the capitals have armour and weapons in the form of a trophy. Mr. Freeman continues: "Both Professor Reber and Mr. Burn note these steps in architectural development. Why do they not go on to notice the next step, when we find capitals of the same anomalous kind used up again in the Laurentian Basilica. From thence another easy step leads us to the use of the same forms in the churches of Lucca, and one more step leads us to the western portal of Wetzlar and to the Imperial palace at Gelnhausen."

MR. GREG, in the *Contemporary Review*, returns to the charge on the subject of our artisans: he certainly succeeds in showing that we have been too hasty in hoping that as much work might be done in eight hours as in ten, as Mr. Brassey's last statements on the matter before the British Association are less encouraging than those in his book on Work and Wages. The author's main contentions are that our industrial supremacy will cease when we come to the end of our cheap coal, and that it will come to an end the sooner if operatives insist upon higher wages and shorter hours while our prosperity lasts. From the first it is impossible to draw any practical inference except that we ought to take care to get the full value in work of every ton of coal, a course which, as Professor Jevons has proved, will not make it last the longer. From the second the writer tries to infer that it is the interest or the duty (which does he mean?) of

the most numerous classes of the community to go without any sensible share of its prosperity, in order that its aggregate wealth may continue to accumulate longer, though it is precisely the most numerous classes who will be able to escape for themselves from the unpleasant consequences if that aggregate wealth should begin to decline. This immense paralogism destroys the effect of Mr. Greg's well-founded warnings against a tendency some of the working-classes are beginning to show to scamp and neglect their work. Why does he not exhort the owners of collieries and immovable factories to content themselves with lower returns on their capital?

MR. GLADSTONE has a first article on Homer's Place in History, in which he endeavours to support the result of his own minute investigations of the Homeric text by establishing points of contact with the produce of Dr. Schliemann's excavations and with Egyptian inscriptions. If the text of Homer deserves investigation at all, it is impossible, as a writer in the *Cornhill* for June points out, that on geographical grounds Hissarlik should be the Homeric Troy, besides which there are traces of a more civilised town before Dr. Schliemann's, and until this is excavated only the vaguest archaeological inferences can be drawn from his discoveries. In treating the Egyptian inscriptions, Mr. Gladstone trusts M. Lenormant too freely, and is too ready to build on the names of the tribes who invaded Egypt in the reigns of Menepthah and Rameses III. The suggestion that the well-established fact of Thothmes III.'s supremacy in the Aegean was remembered by the Greeks as the thalassocracy of Minos, has more to recommend it; and the further suggestion that the more or less Phoenician viceroys of "Minos" are the Aeolidae of heroic tradition is at least ingenious. After all, it cannot be said to be improbable that the unique actuality of the Homeric poems is due to the unusually large amount of real history embedded in them.

In *Temple Bar* for this month there is an article on Poe, exposing the bad faith of the life by Griswold, which is still treated in England as a trustworthy authority. In the *Gentleman's Magazine* for May there is an interesting article on an early collection of Poe's poems, printed for private circulation in 1831, when he was a cadet at West Point. There are copious extracts, which have both a bibliographical and literary interest.

THE Academy of Moral and Political Sciences has elected M. Zeller an honorary member in the section of history, in the place of Jules Michelet.

THE French Academy has awarded the great Gobert prize to M. Georges Picot for his contribution to the history of the States-General, of which we gave an abstract some time since, and which appears in the current number of the *Revue des Deux Mondes*; and the second Gobert prize to M. de Lescure for his book on Henri Quatre. The Thiers prize was awarded to M. Henry Housaye, for his book entitled *L'Histoire d'Alcibiade et de la République athénienne*; while the Thérouanne prize was divided between M. Emile Belot, author of *L'Histoire des Chevaliers romains*, and M. Edmond Hugues, for his work entitled *Histoire de la Restauration du Protestantisme en France au XVIII^e siècle*.

DR. U. A. BURKHARDT, Keeper of the Archives of the Duchy of Saxe-Weimar, is preparing a Handbook of German and Austrian Archives. In addition to the public archives of the different German States, the work will include notices of all charters and other official documents belonging to the German cities and towns, some of which are of extreme interest—as, for instance, those at Frankfort am Main, Nürnberg, Goslar, Worms, &c.; while it will also give a list of all provincial, civic, or private archives which possess any special value for the student of German history. The author proposes to append the name, date, and place of origin of the several deeds, and

to supply information in regard to their contents, the persons referred to in them, the conditions under which they were drawn up, and their objects, purport, application, &c. Dr. Burkhardt's work promises, therefore, to be of the highest importance to the student of history, and will undoubtedly secure for the author the hearty co-operation of all who are connected with the public archives of Germany. In the meanwhile, those interested in the prosecution of the task which Dr. Burkhardt has set himself will be glad to learn that he is taking steps for the organisation of a general congress of persons connected officially with the keeping of the public German and Austrian archives, and has proposed that the meeting shall be held at Eisenach in the course of next year.

DR. F. GREGOROVIVS has made another important addition to historico-biographical literature in his recently published work, *Lucrezia Borgia, nach Urkunden und Correspondenzen ihrer eigenen Zeit* (Stuttgart, 1874). Exhaustive in the use of his materials, and unbiassed in his judgment, Dr. Gregorovius has as usual with him given his readers both new facts and new views in this history of one whom modern writers have taken special delight in representing as at once a monster of moral iniquity, and a woman of matchless grace and feminine softness—a remorseless Maenad at Rome, a tender wife and benevolent ruler at Ferrara. It is especially in regard to this latter and less generally well-known phase of her life after her marriage with Prince Alfonso of Ferrara, that the author has brought forward the most interesting original facts, while the second and last volume has special value from the number of important archives of which it gives extracts, with facsimiles of numerous letters of Alexander VI., Caesar Borgia, and Lucrezia herself. The question of her innocence of the general charges brought against her by the enemies of her evil father and yet worse brother, is certainly not conclusively proved; but, as Dr. Gregorovius reminds his readers, it should be remembered that while the evil repute of Alexander and his son is a matter of history, that of Lucrezia has never been confirmed, and rests only on legendary hearsay.

DR. MAX LENZ, of Greifswald, has in the press a comprehensive work on the Treaty of Canterbury, concluded on August 15, 1416, between the Emperor Sigismund and Henry V., King of England, which was an event of considerable importance in its bearing on the history of the Anglo-French wars of the fifteenth century. Dr. Lenz recently made this forthcoming work the subject of his theme on taking the degree of a Doctor in Philosophy, and from this dissertation, which has been printed at Greifswald, we learn, among many other interesting particulars, that the *Gesta Henrici Quinti*, edited for the English Historical Society, in 1850, by Mr. Williams, is by Thomas of Elmham, "prior Monasterii S. Trinitatis Lentoniae;" and that, according to the author's strongly expressed conviction, the *Vita Henrici V.*, published by Th. Hearne, at Oxford, in 1727, under the name of Elmham, is not the production of that old ecclesiastic, as conjectured by Hearne. From what we have seen in this condensed dissertation of the results of Dr. Lenz's investigations, we shall look forward with sanguine expectation to the completion of his work.

THE Paris corps of firemen has taken long to reach its present perfection. The first police regulation on the subject dates, according to the *Débats*, from 1371; it required each householder to put a hogshod of water at his door under a penalty of ten sous. Another ordinance of 1524 required each inhabitant to keep watch after nine o'clock at night in certain places appointed, to put a lantern with a lighted candle in the window, and to provide a supply of water. In spite of these precautions, however, it was found necessary, at the fire at the palace in 1618, to collect all the

water from wells and the Seine, into the middle of the city, and to form a huge lake round the fire by damming it in with heaps of straw. In 1670 an ordinance of M. de la Reynie, lieutenant of police, required all master-masons, carpenters, and tilers of the capital to report their place of abode to the commissaries of police of their quarters, under penalty of a fine of 300 livres and the loss of their freedom. All buckets and other vessels for extinguishing fire were to be left with various local authorities. The real organisation of the fire brigade began in 1722. The Duke of Orleans had presented the town of Paris with thirty pumps; a corps of sixty men was raised at the expense of the State, and placed under the command of the lieutenant-general of police. In 1770 the number of firemen was increased to 146, and in 1780 to 263, with fifty-six pumps and forty-two buckets: the men were strictly forbidden to receive any gratuity. The National Convention established the corps of Sapeurs-pompiers, leaving it, however, subject to the municipality; and in 1821 a royal ordinance made it a branch of the army, and placed it under the Ministry for War. Lastly, the decree of 1850 gave it its present organisation. Its force is now 1,498 men, costing the municipality about 1,150,000 francs.

NOTES OF TRAVEL.

SOME four weeks ago we announced that the murderer of Lieut. McCausland R.N., who, as our readers may remember, was massacred last year on the East Coast of Africa, while engaged in service for the suppression of the slave trade, had been captured and taken into Zanzibar. We now learn from private advices, that though there can be no doubt as to the man so captured being the real culprit, he has been allowed to get off with a sentence of imprisonment by the Arab authorities. This is much to be regretted, not only on account of the failure of justice, but on the far more serious ground of the state of complete insecurity in which such an act as this at once places the lives of all European settlers or travellers on the coast. The restraint the Arabs and others place on themselves in dealing with Europeans will disappear altogether when they once realise the fact that their lives will not be held answerable for the safety of such Europeans as chance or opportunity may place in their power.

WE announced some weeks ago that Mr. Ney Elias, the Royal Geographical Society's Gold Medallist for 1873, had left England for India, with the view of obtaining encouragement from Government to penetrate into Sikkim and Tibet. We now hear that Mr. Ney Elias has been temporarily attached, by the Viceroy's order, to the Foreign Office at Calcutta. Should the prospects in the Sikkim direction not prove favourable, there seems to be a good opening in Upper Burmah and Yunnan. Since the collapse of the Panthays, the Chinese are flocking there in great numbers, and at present there is a Chinese embassy at Mandalay.

MR. CLEMENTS MARKHAM is, we understand, at present busily engaged in the preparation of the second edition of the most valuable Moral and Material Progress Report of India, which was published under his superintendence last year. This edition will bring the Report up to March, 1873.

DR. G. BIRDWOOD has been appointed one of the honorary secretaries to the committee for the extension of the buildings of the University of Edinburgh. The sum required to be raised is, we believe, 40,000.

WE hear that an expedition under the command of Mr. Wiggins, of Sunderland, will shortly sail for the Arctic regions.

THE stir that was made last year to induce the Government to fit out another Arctic expedition appears to have completely died away. We trust the learned societies are not going to let the matter drop through altogether.

WE learn that a movement has been set on foot which has for its object the assistance of Lieut. Cameron in his present somewhat dangerous position. Our readers may remember that of the four members who originally formed the expedition for the relief of Livingstone, Lieut. Cameron is now the only one remaining in Africa. Two, Dr. Dillon and Mr. Moffatt, are dead, and Lieut. Murphy returned with Livingstone's body to the coast. Cameron determined at all hazards, and in the most plucky manner, to push into Ujiji by himself, and save what might there remain of Dr. Livingstone's effects and papers. The funds at the disposal of the Geographical Society in connexion with Livingstone's discoveries having been quite exhausted, there seemed some danger that Cameron's useful work, and possibly invaluable discoveries, might suddenly be brought to a complete standstill through want of means. We are glad, therefore, to announce that a private subscription list, in which are to be found the names of the Duke of Edinburgh, the Duke of Westminster, and many other influential persons, has been opened with Messrs. Ransom, Bouverie & Co., Pall Mall.

FROM Nagasaki we learn that Good Friday was kept as the birthday of II. M. Jenmutenno, the first Emperor of Japan. The Government offices were closed, and a great number of people attended the Suwa temple to worship him. This Emperor, it is said, was born in the Huga province in the island of Kishiu, and conquered all the islands of the Empire, excepting only Nippon, which was still in a state of confusion and darkness. He ultimately conquered the remaining parts of the country, and took possession of them, accompanied by his son and brothers. He killed and captured the chiefs, and having gained a complete victory, he removed the capital to Kashiwabara in the Yamato province, and was there crowned. These events occurred about 2,544 years ago.

A BUENOS AYRES newspaper gives an account of an excursion across the Andes. Among the points reached was Vilcomayo, 14,533 feet above the level of the sea. The excursionists brought back copies of two excellent journals—one *El Ciudadano*, published at Pano; the other, *El Heraldo*, published at Cuzco, both towns being more than 12,000 feet above the sea-level. At Cerro de Pasco, 14,000 feet high, another journal is published, devoted to literature and the mining industry. Vilcomayo, situated in the midst of the supreme desolation of the Andes, and at a height at which no European could live, possesses a railway, an American hotel, a square, forty or fifty houses inhabited by the railway staff, a station, shops, coal-yards, and all that denotes a busy mining colony. There are also many huts occupied by thousands of workmen, chiefly Chileans, Bolivians, Peruvians, and Indians.

THE *Corriere di Como* gives the following report of the St. Gothard railway. There has been a falling in at the gallery of Bissoni, and all the mason work at the entrance has given way and has to be recommenced a third time. From Bellinzona they write that further surveys of the line from Bellinzona to Lugano demonstrate the impossibility of reaching the height of the gallery of the Monte Ceneri, as originally projected. It may with difficulty be carried fifteen metres lower. Hence the whole plan must be changed, and the gallery, instead of being from 1,800 to 1,900 metres long will be about 2,700 metres. The excavations for the railway stations are begun in the district of Mendrisio and will be rapidly pushed forward. The building at Mendrisio already assumes an elegant and important aspect. The vault of the tunnel near Breganzona will, at the desire of the municipality, be raised, and two shafts made to admit air and light. The tunnels, as a measure of public safety, will be lighted with gas.

WE learn from *The States* that the Yellowstone Expedition returned to Bozeman, Montana, on the 13th ult., in a somewhat battered and exhausted

condition, having been harassed in their march during nearly the whole of April by the Indians. The command penetrated the country to the neighbourhood of Tongue River. Four pitched battles were fought, in which it is claimed that 100 Indians were killed, while the troops had one man killed and two wounded, and twenty horses killed.

THE *Messenger de Taïti*, a paper published by the administration of the French settlements in Oceania, gives an interesting account of the culture of the pearl-bearing oyster on these shores, furnished by Lieutenant Mariat, a resident at Tuamotu, where it is carried on on a large scale. The choice of a locality appears to be the first consideration, one where there is a gentle current being preferable. A sandy bottom kills the oysters; a stony is better, but in it they develop but slowly; a gravelly bottom is also good, but has the same objection as the stony. The best that can be chosen is a bottom of living branching corallines, where they alone thrive, and if one cannot be found, it must be made artificially. Little bits of coral must be scattered over the place chosen, or, better still, little coral rocks, which fasten at once to the ground. The coral must not be left more than an hour out of the water, or it will be killed. It is to be surrounded by a wall of dry stones, and the young oysters distributed in compartments, their mouths turned upwards in the direction of the current, packed side by side, like books on a shelf. At the end of a year the oyster will have attained the size of a small plate, after which it will not increase in bulk, but in weight. Three years suffice to obtain good mother-o'-pearl. When the oyster has produced its young, it abandons them to the stream; they fix themselves to the sides of the stone wall. Care must be taken to protect them, as the corallines, so favourable to the development of the oyster, are most destructive of the young.

THE Austrian corvette *Friedrich* has at length left her moorings at Pola, and started on her East Asiatic cruise, which is to extend over two years. At Shanghai the corvette is to take on board the Austrian Minister for Japan, Siam and China, Herr von Schäffer, whose assumption of his diplomatic office is to be marked by great ceremonies. The last commission of the *Friedrich* will be to transport from the Great Exhibition to be held at Philadelphia, in 1876, all the Austrian goods exhibited.

THE New Orleans *Picayune* has recently published a detailed report of the damage occasioned by the inundations which occurred at the beginning of last month in Louisiana, Arkansas, and Mississippi. In Louisiana alone an area of 2,300,000 acres has been submerged, and more than 25 per cent. of this was planted with cotton, sugar, and cereals of different kinds. Between Housapana and Bolivar, on the Mississippi, the whole valley of Yazoo has been converted into an inland sea, while all the land between the sources of the Amite, in Mississippi, to Lake Ponchartrain was still under water when the report was drawn up. All the bridges on the river north of New Orleans have been swept away, and scarcely a saw-mill along the entire stream has escaped serious damage. In Arkansas the actual loss of property has been less, although a million and a half acres have been flooded; but at the mouths of the Onachita and the Black River the destruction has been so great that months must elapse before any improvement can be looked for. When the waters rose the inhabitants of the low lands found themselves hemmed in by the overpowering rush of two rivers, with no means of escape except by retreating to the roofs and upper stories of their houses, and leaving their cattle and all their crops and farm produce to perish. According to one account, dated New Orleans, May 2, the waters of the Mississippi were at that time still forcing their way through a self-cut channel which had completely overwhelmed

the great cotton-growing districts of Madison, Teusas, Concordia, and Carroll, on to Memphis, and was pouring forth its waters with a velocity and copiousness never before observed in the case of the Mississippi. Some American newspapers have gone so far as to attempt to estimate the force and volume of the flow of the waters at 2,000 millions of cubic feet in the hour, but although we may not be prepared to accept the accuracy of so definite a determination, there can unfortunately be no question of the terrible dimensions of the ruin which has been and is still being brought upon the region of the Mississippi, where the rice and tobacco crops appear to be wholly lost, and the cotton and sugar plantations almost equally injured.

HERR Ernst Mossbach, writing in *Das Ausland*, speaks of the physiognomy of the Indians he met with during his travels. While the primitive inhabitants of America, from north to south, seem to have been of a red colour, with flat faces, low foreheads, black hair and gloomy expression, he frequently met with Indians having Greek and Roman profiles, and some with countenances that involuntarily reminded him of well-known Europeans; heads like Schiller's not being rare. Upon close examination he found the same facial peculiarities of individuals that we notice in Europe, accompanied with similar mental diversity. Among his lowest specimens the question of whether man or beast was not answerable without doubt.

WE learn that the King of Portugal has created Mr. Clements Markham, C.B., a Knight Commander of the Order of Jesus Christ. This honour has been conferred upon Mr. Markham in recognition of the many valuable services rendered by him to scientific geography generally, and more especially as an acknowledgment of the light which through Mr. Markham's researches has been thrown upon the labours and discoveries of ancient Portuguese geographers.

THE science of geography has received another mark of esteem at the hands of royalty, in the person of Mr. Leigh Smith, who has been presented by the King of Sweden with the Order of the Polestar, in reward for his services in relieving the Swedish Arctic expedition in Spitzbergen.

By private advices from Zanzibar we learn that the *Malacca*, one of the steamers of the British India Steam Navigation Company, had commenced the new service contracted for between the company and the French Government, and had returned to Zanzibar from her first trip to Mayotte, Nossi Bè, the Comoro Islands, and Madagascar. The *Malacca* was absent twenty-five days in all, having sailed from Zanzibar on March 10, returning there on April 4. She had to go into quarantine on returning to Mayotte from Nossi Bè, as there was a suspicion of dengue fever existing at the latter port.

The trade thus opened should prove very lucrative. The company must, however, expect much opposition in Madagascar, which will certainly become eventually their most valuable field of operations. At present, however, the reigning race, the Hovas, are known to be most inimical to trade, and especially to export trade. The tariffs at the custom houses are exorbitantly high, amounting in some cases to as much as 25 per cent. *ad valorem* duty; and in no case does any produce, either for import or export, suffer a less duty than 10 per cent. These regulations must, however, be altered in course of time.

SIR WILLIAM TITE'S LIBRARY.

THE sale of this important collection of rare books and manuscripts began on Monday, May 18, and was not concluded until Thursday in this week. We give here an account of some of the most interesting lots put up to auction by Messrs. Sotheby & Co., with the prices realised:—

Thirteen volumes of original autograph letters by distinguished persons of every class, with memoirs of the writers, 325/. A fine fifteenth century block-book, "Apocalypsis Sancti Joannis," 285/.

"Biblia, the Bible, that is, the Holy Scripture of the Olde and New Testament, faithfully and truly translated out of Douche and Latyn into Englishe, by Miles Coverdale, Prynted in the yeaere of oure Lorde MDXXXV." This was the first edition of the Bible printed, and so excessively rare that no perfect copy is known. This specimen realised 150/.

A first edition of the "Breeches Bible," Geneva, 1560, 27/.

"The Golden Legende, conteynynge the Lyves and Hystories taken out of the Bible, and Legendes of the Saintes," black letter, woodcuts, fine copy, but wanting six leaves; morocco, small folio, 1503, 96/. A very curious fact relating to this is that the editor and translator, William Caxton, has used the word "breeches" in the rendering of Gen. iii. 7. "And thenne they toke fygge leyrys and sewed them togyder for to cover theyr membres in the maner of breeches;" showing that the Geneva version is not the original of this expression.

Bonaparte.—Autograph letters, chiefly from illustrious Frenchmen, including letters from nearly every individual of the Bonaparte family addressed to Madame Mère, also an unpublished poem by Frederick the Great, &c., 89/.

Caxton.—"Ranulph Higden, Monke of Chester, Polychronicon," first edition, 1482, 150/.

W. Caxton.—"Here begynne the Booke called the Myrrour of the World" (by Gautier de Metz), black letter, 1491, 455/.

A copy of the second edition of "Don Quixote," Madrid, 1608, fetched 27/ 10/., and an original manuscript of "Chatterton's Poems," 12/. Pynson's first edition of Chaucer's "Boke of the Tales of Canterbury," wanting 12 leaves, 30/.; the only perfect copy known of this is in Earl Spencer's library at Althorp.

"Cocker's Arithmetic," composed by E. Cocker, first edition (only three or four copies known), portrait, calf extra, 12mo., printed for T. Passinger on London Bridge, &c., 1678, 14/ 10s. A 52nd edition of this book appeared in 1748. Even Dr. Diblin was never able to see any one printed before 1700, and mentions the 32nd as the earliest he had met with.

S. T. Coleridge's "Poetical Effusions," with notes, autograph manuscript of the poet, morocco, folio, 37/ 10s.

Thomas Coryate's "Coryat's Crudities, hastily gobbled up in Five Moneths Travels in France, Savoy, &c. . . Newly digested in the hungry aire of Odcombe, in the county of Somerset, and now dispersed to the nourishment of the travelling members of this kingdom." 4to, 1611, 21/.

G. Daniel's Merrie England in the olden time, 112/.

N. Jarry.—"Prières Dévotes," manuscript on vellum, in the exquisite calligraphy of the artist. 16mo, 1645, 53/.

The first edition of Ben Jonson's "Comicall Satyre of every Man out of his Humor." 1600, 16/.

John Knox's "Historie of the Church of Scotland;" original edition, 1584, 26/ 10s.

"Lectionarium continens Epistolas et Evangelia;" manuscript on vellum, small folio, 550/.

"Lectionarium Ecclesiae Romanae," 6/ 10s.

"Lectionarium et Sequentiae cum Antiphonario et Orationibus pro Festis Ecclesiae Romanae," 99/. This manuscript is said to have been the gift of Pope Leo X. to Cardinal Bembo.

A. Leighton—"Appeal to the Parliament; or, Sion's Plea against the Prelacie," with two curious engravings; fine copy in morocco, small 4to. Printed the year and moneth wherein Rochell was lost (September, 1628)—7/ 2s. 6d. For writing this work the author was twice publicly whipped and pilloried in Cheapside, had his ears cut off, his nose twice slit, and his cheeks branded with "S.S." (sower of sedition), and was imprisoned eleven years in the Fleet.

J. Leylande.—"Laboryouse Journey and Serche for England's Antiquities, enlarged by Johan Bale;" black letter, in the original calf binding, 16mo.; "emprinted by Johan Bale," 1549—22/.

"C. Linnaei Systema Naturae," 2 vols. in 3, uncut, interleaved and filled with innumerable notes in the autograph of Thomas Gray the poet; Holmia, 1758—59—42/ 10s.

W. Lithgow.—"Most Delectable and True Dis-

course of an Admired and Painful Peregrination from Scotland to the most famous kingdoms in Europe, Asia, and Africa," with commendatory verses, by Patrick Hannay, Robert Allen, and John Murray; small 4to., 1623—18/.

Longus.—"Les Amours Pastorales de Daphnis et Chloe (traduites du Grec par Jacques Amyot);" fine impressions of the engravings made after designs by the present Duke of Orleans; small 8vo; Paris, 1718—137/.

"Meeting of Gallants at an Ordinarie, or the Walkes in Powles," black letter, in verse and prose, fine copy in calf, small 4to, printed by T. C. and are to be sold by Matthew Lawe, dwelling in Paules Churchyard, 1604—70/.

J. Milton.—"A Maske presented at Ludlow Castle, 1634" ("Comus"). first edition, portrait by Dolle; small 4to, 1637—21/.

J. Milton.—"Lycidas"—"Obsequies to the Memory of Mr. Edward King, Anno Dom. 1638," verses in Greek and Latin, among which is "Lycidas," first edition; small 4to. Camb., 1638—37/.

Milton's "Poems," both English and Latin (including "Juvenile Poems" and "Comus"), first collective edition; small 8vo. 1645—10/ 10s.

Milton's "Paradise Lost, a Poem," first edition, with two additional title-pages, with the name of S. Simmons, in 1668 and 1669, small 4to., Peter Parker, 1667, 22/.

Milton's Autograph. Dante, L'Amoroso Convivio, Vinegia, 1529.—G. della Cassa Rime et Prose; on the title-page in the autograph of the Poet is written, "Io. Milton pre 10d 1629 triest," and at the end of the Rime is an entire sonnet transcribed by Milton from the edition of 1623, ivi, 1563, Varchi Sonetti, 40/.

Milton Autographs, two works formerly in the possession of the Poet.—1. A. Rosse, "Mel Heliconium," with verses addressed to Rosse on his Mel in the autograph of Milton, signed I. M. and a couplet, also holograph, 16mo, 1646. 2. "Le Vieux," "Natura Brevium," with autograph signature of the Poet, "Iohes Milton me possidet;" black letter, 16mo, R. Tottell, 1584, 88/.

CORRESPONDENCE.

THE DECIPHERMENT OF THE HISSARLIK INSCRIPTIONS.

Oxford: May 24, 1874.

In order to remove my doubts as to the varieties of each Cyprian letter which actually occur in inscriptions, and which in the alphabet cast for the Berlin Academy had necessarily to be merged into one common type, Professor Gomperz, of Vienna, has kindly sent me the following copies of the Hissarlik inscriptions which he has deciphered, with such varieties of each letter as he has himself carefully copied from other Cyprian inscriptions. His copies of the Hissarlik inscriptions are taken from photographs which Dr. Schliemann had expressly made for him, and which, on several points, differ from the copies, as photographed from drawings, given in his own book. His tracings of the corresponding Cyprian letters are taken from casts and photographs of the original inscriptions. I may quote his own words: "I have not schematised, I have enlarged or reduced nothing. Every dot, every twist is copied with slavish accuracy from the best Cyprian documents. Nor have I allowed myself to be eclectic, and to mix the letters of different periods and localities."

Accepting these statements of Professor Gomperz, I can only repeat my conviction that his decipherment of the first inscription, *Tagoi diot*, seems to me almost beyond reasonable doubt. The interpretation of the other inscriptions is more open to criticism. The arrangement of the letters in No. 555, to judge from Dr. Schliemann's photographs, is very irregular, one letter only, as far as I can see, being on the seal, the others on the outside; while in No. 3,474, the second letter, which Professor Gomperz reads *go*, is unlike any other form of *go* which I can find. The style of this inscription, too, is strange, to say the least, nor are all the marks which I have on my copy of the bone accounted for in the decipherment by Dr. Gomperz. However, we must wait for the larger work which Professor Gomperz is preparing on the subject of the Cyprian inscriptions.

In the Report of the Imperial Academy of Vienna, April 14, there are nine Cyprian inscriptions read and deciphered by Dr. Gomperz.

MAX MÜLLER.

Note. I have added the figures to each Cyprian letter, according to the order in which they are given by Brandis, *Versuch zur Entzifferung der Kyprischen Schrift*.—M.M.

EYE AND THE RIB.

Berlin: May 19, 1874.

I just see, from the ACADEMY of May 16, that an etymological explanation of the name of Eve suggested by me, has not only been noticed in the ACADEMY, but has even had the honour of being discussed by Mr. Poole. This will, I hope, justify me in putting before you more fully the arguments on which my etymology was founded, and I shall do this by replying *seriatim* to Mr. Poole's objections.

1. If Mr. Poole asserts that al-havāni, ribs, is the plural of a singular hanijātun, I must confess my ignorance of the existence of such a singular. We all know that there is a word hanijātun, but that word does not mean rib. Hanijātun, as a singular of the plural havānin, is a pure grammatical fiction, nowhere to be found in the *thesaurus* of real Arabic.

2. That havānin must of necessity be traced back to a triliteral root hnv or hnj, i.e., to a radical word hanā, is no doubt in accordance with

the commonly received rules on plurals of the favā'ilū class;* but within this class plurals like havānin; i.e., plurals having but two firm consonants, require a particular treatment—nay, I might say, that every single one of them requires its own individual treatment. Mr. Poole would hardly feel inclined, for instance, to treat the plural mavānin, harbour,† as belonging to a verbal root, manā. Plurals of this class are frequently without any singular at all, or are to be classed as *pluralia tantum* on account of the peculiar meaning which they have, besides sharing many affections which distinguish weak bases in all Semitic dialects, and which bring many of these plural forms into close relation not only with stems *mediae*, but also *tertiæ semivocalis*. I only mention kavāfin, rhymes (kafā and kāfā, sectatus est); davāni (danā and dāna, vilis fuit); havāschin † (haschā, closely related to hāschā); djavārin (with a parallel form djavārun, from djāra). If other scholars acknowledge the possible derivation of some of these plurals from biliteral roots, I am content with drawing from these observations this conclusion at least, that in several of them the *v* in the second place is not simply a formative element of the plural, but somehow or other connected with a radical *v*. §, ||

3. Following this line of reasoning, it would have been perfectly legitimate to trace back havānin, if not to hanā, still to hāna (stem hvn). That root exists, but has nothing to do with ribs, but only with time. On the other hand, it seemed to me when I first wrote on this subject—and it seems to me so still—that we cannot but recognise an intimate connexion between the word for ribs and the root hvj, meaning (1) to embrace; (5) to

* The formation of the *plurales fracti* from singular forms, adduced by grammarians, is mostly based on accidental and purely empirical abstractions, not on a real internal development. The form favā'ilū stands by itself, as having alone (in Arabic and Ethiopic) received a syllabic increment behind the first radical letter. In this particular formation, however, so far as it refers to triliteral roots, I should feel inclined to admit the possibility of a real internal development. It seems to me that one might in the singular form fā'il(un), or fā'ila(tun) look upon ā as a representation of an original av, so that the form favā'ilū, formed by insertion, would be an organic development of fā'ilun. The o of the Hebrew part. pō'el should here be taken into account, though grammarians generally treat it as an obscured ā. Arabic scholars might prefer to represent this process as caused by the insertion of *v* between two ā's, as representative of the Elif hamsatum, making favā'ilū to stand for fā'ā'ilū.

† If it were possible to derive this plural from ma'un (base mv), water, it would form an excellent analogon to havāni from hv. I am content, however, to abide by the ordinary view which makes it a plural of the singular minā, this minā being represented as a derivation from the Greek *μῆνη*, after losing the *l* which was supposed to be the Arabic article.

‡ The close connexion of the two stems haschā and hāschā has been limited by Lane, in accordance with the views of native lexicographers. Hāschā, which is frequently written hāschā, is declared to be the only right spelling. The point of coincidence, however, between the two roots, is not thereby eliminated. Formations such as hūschijjun, unsocial; hūschigatun, inability for society; hūvāschatun, horrendum, cannot be severed from the base hāschā. (See also conj. iii. and *v*. of the same).

§ In Hebrew, *h* in the second place is in many words purely formative, but this does not exclude its being radical in others. Interesting in this respect is the substantive *schō'ah* from a base *med. v*, while in the verb we have only the base *tert. v*. (Ewald, § 186, c. 72 b.)

|| Cases in which bases *med.* and *tert. semivocalis* form at the same time regular plurals of the form favā'ilū are scarce; for instance, bavā'iku (bāka) and bavākin (bakā). Nor is it by accident that Arabic lexicographers remark that bakā is not a genuine Arabic base (Lane, I. i. 276; therefore introduced after the schema of the forms had been established). Very instructive—though, of course, for the etymologist only—is the plural davāhinu. There is no corresponding singular form from a root dhn. Gram-

marians employ it as an anomaly with the singular duhhānun. That there was a root dāha (dvh) with the same meaning, is proved by dā'ihun, nocturnal darkness, which does not belong to dāha, to subject (trans. and reflect.), but to the group dhn (cf. dāhnānātun, nocturnal darkness), and presupposes as to form a base dvh. The consequences as to *v* in davāhinu, and for the secondary character of *n* in the form are palpable.

¶ With reference to hanā it will have to be admitted that "benders" may mean sinews, but hardly bone.

** Gesenius remarks in his *Thesaurus* (s. v. hbl): "The syllables hab, hab, ab, av, etc., have the meaning of breathing. In Hebrew hav refers to the breath of the pectoral cavity, while pūch refers to labial, nu'ch to nasal, ru'ch to faucal breathing. In Arabic, the words havā'itu, circumvallatio, havāli, surrounding, are connected with hav.

†† This is not affected by Lane giving the number of the ribs as four, for they are to be taken as two pairs. In Hebrew common duals remain even when referring to odd numbers. Seven eyes, not 'ēnim, but 'ēnayim.

‡‡ Consider the well-known formation of plurals in Hebrew, Arabic, and Ethiopic, from plurals; also 'elōhim, sing. In the opposite direction we see plurals, such as schāmājim, majim, become really duals. Majim is treated as singular and becomes pluralised, mēmāv, his waters. In the singular, Jerusalem we see before our eyes the final lēm developed to a dual lajim. The notorious crux of Ibn Mukbil, viz., tau'abānijjāni, may possibly be removed by admitting a popular dual tau'abāni, raised to a new dual tau'abāni, with the ' fixed. (Base v'b; cf. va'bun, goblet; va'batun, well.)

I need hardly say that it was not my intention to enrich Arabic school-grammars with a new dual in *ani*, or to cavil in any way at the exquisite carefulness with which Arabic lexicographers have forced the whole fauna of their language through the narrow gates of triliteral roots. But to the etymologist, to the historian of language, it is not only permitted, but, in cases like the present, it becomes his first duty to look through and beyond this carefully woven net of grammarians, and to watch language where it lives and grows on its native soil, in the mouths of the people, in the anomalies of the streets, and in the misunderstandings of the nursery.

P. KLEINERT.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

- SATURDAY, June 6,** 1 p.m. Sale at Christie's of the Barker Collection.
3 p.m. Royal Institution: Mr. R. A. Proctor on "The Planetary System."
" Institute of Actuaries: Anniversary.
" Crystal Palace Fourth Summer Concert (English Music).
" New Philharmonic Concert (St. James's Hall).
8 p.m. E. Silas's Concert (St. George's Hall).
8.30 p.m. First Night of *Giroflé-Girofla* at the Opéra Comique.
- MONDAY, June 8,** 1 p.m. Sale at Christie's of the Italian and French Decorative Objects in the Barker Collection.
2 p.m. Sir Julius Benedict's Annual Concert (St. James's Hall).
8 p.m. London and Middlesex Archaeological: Mr. T. Milbourn on "The History of Royston;" Mr. W. Rye to exhibit and describe a series of Diaries and Account-books kept by the family of Isham, of Lampport, from 1626 to 1737.
8.30 p.m. Royal United Service Institution: Major J. P. Morgan on "Breech-loading and Muzzle-loading Systems for Guns."
- TUESDAY, June 9,** 1 p.m. Sale at Sotheby's of the Old English Porcelain of R. Colson Taylor, Esq.
8 p.m. Photographic. Anthropological Institute.
- WEDNESDAY, June 10,** 3 p.m. Royal Literary Fund.
" Madame Nilsson's Concert (St. James's Hall).
4.15 p.m. Royal Society of Literature.
8 p.m. Geological. Archaeological Association.
" New Philharmonic Concert (St. James's Hall).
8.30 p.m. First Night of *L'Article 47* at the Princess's Theatre.
- THURSDAY, June 11,** 3 p.m. Mlle. Krebs's Second Piano Recital (St. James's Hall).
8 p.m. Society of Arts: General Meeting. Mathematical.
8.30 p.m. Royal: Papers by Mr. J. N. Lockyer, Professor Roscoe and Mr. A. Schuster, Professor Owen, Mr. R. Mallet, and Dr. Burdon Sanderson.

- FRIDAY, June 12,** 1 p.m. Sale at Christie's of Sévres porcelain.
3 p.m. Hallé's Sixth Recital (St. James's Hall).
4 p.m. Professor Bunnell Lewis's First Lecture at University College on "Classical Archaeology."
7 p.m. Literary and Artistic.
8 p.m. New Shakspeare Society: Rev. F. G. Flay on "Certain Plays of Shakspeare of which portions were written at different periods from other portions."
" Astronomical. Quckett Club.

SCIENCE.

An Introduction to the Critical Philosophy. Intended for the Use of Students. By W. H. S. Monck, Barrister-at-Law. (Dublin: William McGee, 1874.)

THIS is an excellent little book, which will well repay the attention of all students of Kant. It contains in the short space of 168

pages a summary and an interpretation of the Critic of Pure Reason. The mode of treatment is clear and straightforward, well calculated to let in light upon a subject which there is always so much temptation to make a mystery of.

The author is himself a Kantian, and the object of his special admiration is the wonderful construction to which the Transcendental Analytic is devoted. Of this he says, at p. 75:—

"The doctrine of the Schematism forms the key to the whole of its elaborate superstructure. The Categories are mere empty forms unless we can obtain objects to subsume under them; but this can only be done by means of the Schemata, which, in realising the Categories, at the same time restrict their application to objects of possible experience. The Categories without Schemata are perfectly indeterminate."

This is striking the right note. And the Principles are then shown to complete what the Schemata have begun. The Schemata work up the "manifold of sense" into a shape fitting it for union with the Categories; are conditions of applying the Categories to sense, so as to produce experience. The Principles are the modes in which this application is effected. The Categories unite with the Schemata by or under the Principles. The "sensible manifold" must take the shape of Schemata before it becomes susceptible (so to speak) of the Categories; in their union the Principles are generated, which are the ultimate canons of judgment for all possible experience—Schemata, Categories, and Principles alike flowing from the single, central, subjective unity, the *Ich denke*.

There are parts of Mr. Monck's book in which it must be said that he seems not to be completely master of his subject; though even then he never ceases to be suggestive. One of these is his treatment of the Postulates of Empirical Thought, which are the fourth and last division of the Principles. Indeed he confesses his doubts as to the correctness of his exposition of the First Postulate, in a note at p. 70. But it must be remarked besides, that he does not give the true form of the Postulate itself. This runs, not as Mr. Monck gives it "The formal conditions of experience must be assumed as possible," but "Whatever agrees with the formal conditions of experience (in intuition and concepts) is possible." The statement is not that such and such conditions are possible, but that the objects imagined, schematised representations, under such and such conditions, are possible. The Postulates are in fact definitions of the objectively (or in experience) possible, actual, and necessary; definitions given by assigning the mode in which we form the notions of them. "They tell us," says Kant in the note on the third Postulate, "nothing else about a concept, but the act of the cognition-faculty by which it is produced." Its content remains unaltered, the same for all three Postulates.

One of the most instructive discussions in the book is that on the Fourth Antinomy, and its difference in structure from the other three, at p. 111. Its Antithesis is peculiar in taking the shape of a dilemma, the argument in all the other cases being a

demonstration *ex absurdo*. Again, the distinction, in the three first Antinomies, p. 104, of the Thesis as maintaining the Absolute, the Antithesis the Infinite, in Sir William Hamilton's sense, is most valuable; throwing light as it does on this later philosophy, the cardinal principle of which is thus seen to be nothing else than the unsolved Kantian Antinomies.

I cannot but think, however, that Mr. Monck is sailing on a false tack in attempting, as he does at p. 89, to bring the other two Ideas of the Reason, namely, the Soul and God, into more direct and complete relation with the Categories. The reason why there is this complete relation in the case of the Idea of the World is, that there is a real phenomenal world, with which the Idea of the World, or World *in itself*, is confused; and the dialectical mirage, *Schein* (which in this case is an Antinomy), arises, according to Kant, in applying the real forms of the real world to that real world itself, as if it was of the nature of the supposed one, the World in itself; to show which, these forms must be themselves examined, and the Categories directly applied. But wherever, in the Critic, the Categories are applied, we have them distributed under their four heads;—so in the Schemata; so in the Principles; so in the corresponding table of the four kinds of Nothing (by the way, how comes this instructive table to be omitted?); so, lastly, in the Antinomies. It is merely accidental to the Ideas of the Reason, that any of them should fall under the application of the table of Categories; they arise, as Mr. Monck very truly points out, from the three kinds of syllogisms, closing, as it were, the three vistas opened by those three methods of reasoning. It is only when there is a real phenomenal object, of like name with any of them, that they are subject to the application of the Categories.

When Mr. Monck raises the point of the nature and validity of the Law of Parcimony or Homogeneity, at pp. 149-152, he raises a question of the utmost importance. If Kantians should ever be driven to surrender the Categories as subjective law-giving to nature, they might possibly still entrench themselves behind the Law of Parcimony. But to enter on this subject would lead us too far.

In concluding, Mr. Monck points his readers to "one or two defects in the system itself to which the disciples of Kant should direct their attention, if the doctrine of their master is ever to be generally accepted." These are two—the position of the Noumenon in the Critical Philosophy, and the proper co-ordination of the Table of Categories: two points, it may be said, of very unequal importance. The first is one which lies at the root of the whole post-Kantian schism, Fichte's point of departure from Kant; and the very existence of Kantianism, as a system, seems to be involved in the possibility of maintaining at once the existence of Noumena, and their essential difference from Phenomena. Kantians, therefore, and post-Kantians alike may be glad to see this point brought prominently forward for discussion. SHADWORTH H. HODGSON.

Indische Studien: Beiträge für die Kunde des indischen Alterthums. Im Vereine mit mehreren Gelehrten herausgegeben von Dr. Albrecht Weber. Dreizehnter Band. (Leipzig: F. A. Brockhaus, 1873.)

THE periodical publication of which the thirteenth volume forms the special subject of this notice was commenced in 1849. Three volumes are entirely occupied with the original texts of Sanskrit works of which complete editions had not previously appeared. Vols. vi. and vii. contain the hymns of the Rig Veda, edited by Professor Aufrecht, and in vol. xii. is printed the Taittiriya Sanhitā, both in the Roman character. Another volume, the eighth, is devoted to the subject of Indian metres.

The contents of the remaining volumes are of a miscellaneous character, such as shorter Indian texts with translations, analyses of different Sanskrit works, reviews of books in various departments of Indian literature, discussions on different questions of Indian literary history and antiquity, &c. &c. A great proportion of the contents of the volumes is from the pen of Professor Weber himself; but he has been largely assisted by other scholars.

Omitting any reference to the contributions of others, I may mention as among the most important of the editor's own articles those on the two legends from the Śatapatha Brāhmaṇa, regarding the deluge, and the immigration and diffusion of the Aryans in India, &c. (in vol. i.); the analyses of the Upanishads contained in Anquetil du Perron's translation (in vols. i., ii., and ix.); the account of the most recent researches on Buddhism; and the paper on the connexion between Indian and Greek fables (vol. iii.); the nuptial texts from the Vedas (vol. v.); the elaborate review of Professor Haug's translation of the Aitareya Brāhmaṇa (vol. ix.); and the collectanea on caste-relations in the Brāhmaṇas and Sūtras, and contributions to a knowledge of the Vedic ritual (vol. x.).

The volume which has just appeared contains four articles, all from the editor's own pen. The first (pp. 1-128) is on the "Pada-pāṭha of the Taittiriya Sanhitā," i.e. the particular form of the text of that work in which the words, and even elements of words, are given in their isolated state, without those final and initial phonetic changes which they undergo when combined into complete words, simple or compound. The second paper (pp. 129-216) contains a translation of the second book of the Atharva Veda, with explanatory notes. The third article (pp. 217-292) is a continuation of the paper on the "Vedic Ritual of Sacrifice," published in vol. x. The fourth article (pp. 293-496), of which I propose to give a more detailed account, relates to the Mahābhāṣya of Patanjali, illustrated by the Commentary of Kaiyaṣa, of which a complete (lithographed) edition, edited by two Pandits of the Government College in Benares, was published there in 1872. This work (then unpublished) had been already described in Professor Aufrecht's Catalogue of the Sanskrit MSS. in the Bodleian Library, and in Professor Goldstücker's Pāṇini. The Sūtras or aphorisms of the great Indian grammarian

Pāṇini were discussed by Kātyāyana in his Vārttikas, which do not form a complete commentary, but are merely a series of criticisms on such of the aphorisms as appeared to this author to be erroneous or defective, and are silent regarding those with which he had no fault to find. Patanjali, on the other hand, undertook the double task of controverting Kātyāyana, when he appeared to be wrong, and of criticising Pāṇini. He also leaves many of the aphorisms without any comment. Of these latter, however, many are elsewhere quoted by the two critics in question, while others must be presupposed as necessary for the explanation of some on which they comment. There still, however, remain a number of the rules ascribed to Pāṇini which are not thus certified, and many of which, as Professors Aufrecht and Weber suppose, may have arisen at a later period out of the Vārttikas, or critical observations on the original rules. The genuineness of the whole of Patanjali's work itself, as we now have it, is not, as Professor Weber considers, beyond the reach of doubt, as some grounds exist for supposing that the book, after having been mutilated or corrupted, was subsequently reconstructed, and at the same time perhaps received various additions from the pen of the compiler. We cannot, therefore, be quite sure that any particular portions of the existing work have proceeded from Patanjali himself, or consequently that the statements and references which they contain convey to us contemporary information in regard to the events and circumstances of his age. At the same time, Professor Weber remarks that the general impression produced by the contents of the work is decidedly favourable to the supposition of its genuineness. A further question arises, whether the fact of the book, as it stands, leaving so large a portion of Pāṇini's aphorisms untouched, does not result from the circumstance of its being merely a collection of fragments rescued from the wreck of the original commentary. This, however, Weber regards as an improbable supposition, since the work, as we have it, is distinguished by a character of essential unity, arising from its being mostly a defence of Pāṇini against Kātyāyana—a character which would be difficult to explain if it were merely a recombination of fragments of the original book. Having premised these reservations, Professor Weber proceeds to extract from the Mahābhāṣya a variety of particulars which throw light on the age of its author (or, at least, on that of the parts of the work in which these particulars are found), and on the political, religious, social, and literary condition of the contemporary Indians. Thus, illustrations of grammatical rules are given which contain allusions to sieges by a Grecian king, and to sacrifice performed on behalf of an Indian prince, Pushyamitra, which (even if we are to suppose that they are current examples borrowed by the author from his predecessors) at all events show that the writer who employs them was posterior to the historical events and persons referred to. These references, however, do not enable Professor Weber to fix Patanjali's date more precisely than by placing it somewhere between B.C. 160 and A.D. 60, though a different conclu-

sion is deduced from them by others. Among the items of contemporary information drawn by Professor Weber from the Mahābhāṣya, is a complaint of the writer of that work that the study of grammar, which had been diligently prosecuted in earlier times, was neglected in his own days,—a complaint, however, which Professor Weber considers to be shown by the other data supplied by the work, to be groundless. Professor Weber also finds in the book clear allusions to Buddhism; to a treatise on the Lokāyata or materialistic philosophy (while in one of the aphorisms of Pāṇini himself mention is already made of atheists and fatalists); to the Brahmanical deities of the Epic period, Śiva, Viṣṇu, &c.; to images of the gods; to Vāsudeva or Kṛishṇa as a god or demigod, and to his having slain Kansa and bound Bali,—events which were represented in pictures and on the stage, and celebrated by bards; to the seven dvīpas, or continents of the earth, to the limits of Āryāvarta (the most holy portion of India), and to various other geographical details; to provincial differences of language, and indications of the supersession of Sanskrit by Prakrit; and to the preceding grammatical literature, both antecedent and subsequent to Pāṇini. Some particulars are given of the relations between teachers and their pupils. If a youth intoned a word with a false accent, he had his ears boxed. The teacher sat on a pure spot, with a bunch of sacred grass in his hand, with his face to the east, and gave his instructions with the aid of gestures, movements, eye and voice. A pupil who was constantly changing his master was called a *tīrtha-kāka*, or wandering crow. The grammarians had frequent discussions, and often, in the heat of argument, called each other by hard names. Females are also alluded to as teachers, which shows the high position which the fair sex occupied, at least among the Brahmins. Among the literary data furnished by the Mahābhāṣya may be mentioned the fact that the words quoted as the initial words of the Atharva Veda are not the same as those with which the text of that Veda, as we now have it, commences, and are not found before the sixth hymn of the latter; and a word *śaśṭhipāṭha*, which shows that the Śatapatha Brāhmaṇa consisted at one time of only sixty, instead as afterwards, and now, of a hundred sections. In a passage which had been previously quoted by Professor Goldstücker, the Mahābhāṣya declares the Vedic texts to be uncreated and eternal as regards their sense, though it is allowed that the order of the words is not eternal, but in many cases varies in the different recensions. Writing is referred to as practised by Brahmins. Then, as now, the Veda was read by many without being understood. In one place the word *ātman*, or self, is clearly stated (though this was recognised before) to have a double sense—that of body as well as soul. Various allusions are also found relating to social life and morality, to amusements, literature, and dramatic exhibitions.

The dissertation of which an account has just been given, forms a sequel to two former articles by Professor Weber, one in the first volume of the *Indische Studien*, headed

"Sketches from the Age of Pāṇini," in which the author seeks to derive from the references which that writer's aphorisms contain an idea of the extent of the literature which existed in his time. The second article is one in the fifth volume of the *Indische Studien*, which treats of the age of Pāṇini, and Professor Goldstücker's views on that and other subjects, of which it contains an elaborate review. Professor Goldstücker assigns a high antiquity to Pāṇini, placing him before Buddha; and as he accepts the year 543 B.C. as the date of the death of the latter, if we assume that the sage's labours extended over a period of forty-eight years, we arrive at the year 591 B.C. as the time when he came forward as a teacher; so that we must place Pāṇini, if he preceded Buddha, as high as the seventh century B.C. This view Professor Weber contests, holding that it is proved by various allusions to Buddhistic practices, which he adduces from Pāṇini, and by other considerations, that the great grammarian lived after the establishment of Buddhism. Professor Weber also denies the validity of the proofs brought forward by Professor Goldstücker, to show the following points, viz.: (a) that Kātyāyana, the critic of Pāṇini, lived at a very long period after the latter; (b) that the white Yajur Veda did not yet exist in his time; (c) that the Prātiśākhya were subsequent to his age; and (d) that, in short, of all the Sanskrit works known to us, only the hymn-collections of the Rik, and Sāman, the Sanhitā of the black Yajur Veda, and the Nirukta of Yāska then existed. Although I do not venture to pronounce an opinion on all the matters at issue between these two scholars, I think that Professor Weber generally or often succeeds well in controverting those views of his antagonist to which he is opposed, and in vindicating his own positions; while the moderation of language and temper which he maintains throughout the discussion, notwithstanding the temptations to a different course which were unfortunately offered by the tone and character of the work to which he was replying, redounds highly to his credit.

Professor Weber has been charged with too great haste and rashness, in the publication of premature conclusions and uncertain speculations, which he has afterwards found himself obliged to modify. Though in such cases a reasonable amount of circumspection is desirable, I think that procedure such as Professor Weber's is preferable to the procrastination of those who, dissatisfied with such certainty as may in the meantime be attainable, and in the hope that further research will throw light on what is at present obscure, continue to suppress the more or less probable results which have been already acquired, until, perhaps, all chance of giving them to the world is lost. To me it appears that, in such a comparatively unexplored region as that of Indian antiquity, the right course to be followed in the circumstances supposed, is to communicate to the learned world such new information or conclusions as after a reasonable measure of reflection appear to be obtainable from the study of the documents for the first time brought to light: for although the literature of India is not yet completely known, we already

possess a sufficient acquaintance with the productions of its different periods to be able to reject at once anything which is inconsistent with the genius and general character of the whole. Competent scholars are in no danger of falling into the snares in which Colonel Wilford in earlier, and M. Jacolliot in recent, times have been entangled, and receiving for genuine Indian myths or legends, the fabrications of interested Brahmans. By publishing such new data as he may have succeeded in bringing to light, and stating such conclusions as they appear to imply, the investigator will obtain the benefit of the criticism and suggestions of other scholars, and the way will thus be more speedily prepared for the formation of mature opinions upon the questions involved.

While there are some of Professor Weber's opinions, such as those connected with the supposition of Christian influences on the development of Indian beliefs, on which, owing to insufficient examination of the data, I am not prepared to pronounce an opinion, I consider that by his manifold and diversified researches in the most various departments of Sanskrit and Prākṛit literature, to which I am unable to refer here more particularly, he has succeeded in throwing so much light upon numerous questions and subjects connected with Indian history and antiquities, as to entitle him to be ranked among the most distinguished of contemporary Indianists. J. MUIR.

NOTES AND NEWS.

WE understand that at a recent meeting of the committee for conducting the Sub-Wealden Exploration, it was decided to take measures to continue the boring beyond the depth of one thousand feet. That depth is now nearly attained. At the time we write, an accident has happened to the machinery, which has caused operations to be temporarily suspended.

ADDITIONAL evidence tending to support the conclusion that the Hellenic Peninsula was connected with the continent of Africa during the Miocene period, has recently been brought to light by the discovery of a fossil cycad at Koumi, in Euboea. The rich Miocene flora of Koumi has been studied by several naturalists, and its relations to the African flora did not escape the acute observation of the late Professor Unger. M. Gorceix has now discovered the impression of the frond of a cycadaceous plant, which has been referred, by M. G. de Saporta, to the recent genus *Encephalartos*, now confined to Southern Africa. The species has been dedicated to its discoverer, and described before the Academy of Sciences of Paris as *E. Gorceixianus*. This discovery supplies an interesting link in the history of the Cycadeae in Europe. During the Secondary period cycads were abundant; they have left their remains, for example, in our Purbeck "dirt-beds," and are known to the Portland quarries as "birds' nests." Subsequently, however, the order appears to have been but feebly represented in Europe, and tertiary cycads are extremely rare. The Koumi specimen furnishes, therefore, an acceptable proof that cycads still flourished in Europe during the Miocene period.

To prove that most of the lignites and plant-beds of Western America are not of Eocene age, as has been asserted by some authorities, is the main object of a paper communicated to a recent number of *Silliman's Journal*, by Dr. J. S. Newberry. The author believes that some of the western lignites are of Cretaceous and some of Miocene date; but he maintains that no group of plants comparable with the Eocene flora of Europe

—such as that of the Isle of Sheppey or of Monte Balco—has up to the present time been found anywhere in America.

It is well known that extensive deposits of coal, or lignite, of Liassic age, are worked at Fünfkirchen, in Hungary. A valuable series of fossil plants from this neighbourhood has been collected by Herr Boeckh, of Pesth, and a report upon this collection has been presented by Dr. Stur to the Imperial Geological Institute of Vienna. The fossils were collected not only from the coal-bearing Lias, but also from certain sandstones which occur between the Lower Lias and the Muschelkalk. The lowest horizon from which Boeckh has obtained fossil plants is immediately above the Muschelkalk, in what appears to be the equivalent of the *Bairdia*-limestones of Würzburg. A second plant-bearing zone was found in the upper part of the sandstones, and it is inferred, from the character of the fossils, that this portion of the series belongs to the Rhoetic formation. The third stage from which specimens were collected coincides with the lowermost lignites of Fünfkirchen, and the frequent occurrence here of *Equisetites Unger*, Ett., leaves little doubt that these beds really belong to the Lias; hence the limits between the Rhoetic and the Lias must be drawn somewhere between these two plant-bearing horizons.

Is the peculiar structure known as *Eozoon* a true fossil of foraminiferal type, or is it, after all, nothing more than the result of chemical and physical action? This old controversy between Dr. Carpenter and Professors King and Rowney, has been recently revived, in the *Annals and Magazine of Natural History*, by Mr. J. H. Carter. The current number of the *Annals* contains an able paper by Dr. Carpenter, in which he not only replies to Mr. Carter's strictures, but seeks to refute the anti-eozoonists generally. After contending that the arrangement of the so-called nummuline tubulation of *Eozoon* is not incompatible with true nummuline structure, he brings forward several striking points of conformity between the characters exhibited by the best preserved specimens of *Eozoon* and those of certain Foraminifera. As it is now nearly ten years since the *Eozoon Canadense* was introduced to the geological world, it is not without interest to find Dr. Carpenter giving a sketch of its history. In this sketch he reviews the general evidence on which he and the Canadian naturalists relied in concluding that the structure then newly discovered in certain ophites, or serpentinous limestones, from the Lower Laurentian rocks of Canada, represented a true organism; that the microscopic characters of this organism placed it among the Foraminifera; and that this foraminifer was, in fact, the oldest fossil known to the palaeontologist. It appears that Dr. Carpenter is endeavouring to persuade his friends in Canada to join with him in the preparation of a monograph on *Eozoon*, to be submitted to the Palaeontographical Society.

GEOLOGICAL news from Persia has been sent home to Vienna by Dr. Emil Tietze, who is at present engaged in exploring the mineral resources of that country. During his journey from Tiflis to Teheran he had but little opportunity for making geological observations; and as soon as he reached Teheran he was attacked by typhoid fever. On his recovery he proceeded to explore the Albus mountains, north of Teheran, where he found good lithographic limestones and large deposits of gypsum. Above the village of Rute he observed two beds of coal, in greenish sandstone, with argillaceous brown iron ore in the neighbourhood. Iron ore and coal were also found in similar sandstone elsewhere, whilst copper ores, consisting of malachite and copper pyrites, were also discovered in the Albus range. In a second letter, Dr. Tietze describes his visit to the coal-deposits of Hif, where the mineral fuel, as elsewhere, is found in association with iron ore. It appears that the Persian coal does not belong to

the true palaeozoic coal-measures, but is of mesozoic age; nevertheless it is said to be of good quality, and is likely to prove of great value to the country. Dr. Tietze has discovered, in the valley of Ghosen, five or six veins of nickel ore, consisting of kupfernickel and green nickel-ochre, occurring in diabase-porphry.

A JOURNEY last summer through the southwestern part of Transylvania, has enabled Dr. C. Doelter to communicate to the last part of the *Jahrbuch d. k.k. Geolog. Reichsanstalt* an interesting paper, entitled "Aus dem Siebenbürgischen Erzgebirge." The country visited lies between the river Aranyos and the Maros, and includes the mining districts around Verespatak and Offenbánya. Observations were specially made on the eruptive rocks, of which several new occurrences were noted. The rocks which break through the crystalline slates of the Gaina appear to be andesites, and the tertiary eruptive rocks are also for the most part andesites, including a quartziferous variety which has been distinguished under the name of dacite. Dr. Doelter has specially addressed himself to the study of the Transylvanian trachytes, and has recently contributed a valuable paper on these rocks to Tschermak's *Mineralogische Mittheilungen*.

THE French Academy of Sciences has elected M. de Kokscharow foreign correspondent in the section of mineralogy, in place of the late Professor Sedgwick.

Geology of Spitzbergen.—The *Revue Scientifique* reports an account given to the Austrian Institute of Geology, of a journey to the west coast of Spitzbergen, made by R. von Drasche, in 1873. Contrary to what he observed on the neighbouring coast of Scandinavia, he found Spitzbergen very rich in sedimentary formations, all the strata except the Silurian being represented. The formation of Hekla-Hook, probably corresponding with the Devonian, attains a great development at Belsund, Eidfjord, the Isle of Prince Karl-Vorland, Wydie Bay, and the region north-east.

Permian fossils were found at Cape Bohemann by Professor Nordenskiöld. The carboniferous limestone was rich in fossils on the west coast, and at Hinlopen-Strat: "The triassic formation, with saurian remains, is seen at Eidfjord, Cape Thorsen, the promontory of Stans, and at Barentz. Jurassic strata were observed at Cape Agardh, in Storfjord, and in the Bay of Advent, in Eidfjord. The miocene beds of Belsund and Eidfjord exhibited a great abundance of vegetable debris. Recent formations were in default, and glacial striae were rarely seen, probably on account of the rapid destruction of the rocks.

Of the crystalline rocks specimens were collected of gneiss, granitic gneiss, and more rarely of granite. These rocks were observed at localities extending from the seven ice mountains of Magdalen Bay, Amsterdamö, and Dansko, to Red Bay. In Magdalen Bay, Von Drasche observed a crystalline limestone intercalated on the gneiss, and rich in crystals of garnet, titanite, chondrodite, &c. The mountains of Magdalen Bay and of the strait of Smeeringberg are remarkable for their crater forms. Although composed of gneiss, they present numerous crater-like cavities, sloping towards the coast and in a line with it. Their hollows are filled with snow, and glaciers issue from them. The gneiss strata incline regularly towards the north and show no special relation to their peculiar forms, and the same configuration is seen at Wydie Bay, and is ascribed to the erosive action of glaciers.

On the plateaux forming the eastern part of Dansko and Amsterdamö, Von Drasche observed enormous erratic blocks, composed chiefly of granite, syenite, and gneiss. These fragments do not belong to any of the rocks of the district, and he supposes them brought by glaciers from the interior of Spitzbergen, or even from more northern regions. Black limestones and chloritic schists, like those of Taurus, represent the Devonian

formation. In the Isle of Karl-Prinz-Vorland are highly disturbed calcareous schists surmounted by a quartzose conglomerate with a chloritic cement. This last forms two colossal pyramids at the entrance of a large valley. In the carboniferous rocks at Azelo, corals, bryozoa, productus, and spirifer, are found in great quantities.

The triassic formations are largely represented at Cape Thorsen. In the middle of bituminous schists in a valley of Norweg, the limestone concretions are rich in nautilus, halobia, etc., and the remains of a vertebrate, probably a saurian, were discovered. In the Goose Islands, a recent upheaval of the soil to the extent of eight or ten feet was noticed, and at this height above the high tide level some shells of *Mytilus edulis* (mussel), perfect, and preserving their blue colour. It is remarkable that this mollusk is not now found alive further north than Tromsø. No animal fossils were found in the tertiaries, but frequent remains of plants.

The Slav Gipsies of Montenegro.—*Das Ausland* (No. 21, 1874) has a long letter from Herr B. Bogisic on these gipsies, who are represented as speaking only the Servian language, even their old men being unacquainted with the gipsy tongue, and having no intercourse with the nomadic gipsies, whom they despise. In religion they follow the local faith, being mostly Mahometans where the Turks prevail. They carry on the business of lock and other smiths as public functionaries, the tribe providing workshop and tools, and each family contributing an annual supply of raw products, wheat, &c. Although not prevented by any positive law, they do not intermarry with the Montenegrins, the poorest of whom would not give his daughter to a rich gipsy.

Proceedings of the Belgian Academy.—Among the papers recently presented to the Académie Royale des Sciences, Belgium, we find one by Dr. Putzeys "On the Centres of Vaso-motor Nerves," on which M. Schwann reports that it confirms the experiments of MM. Golz, Schlesinger, Freusberg, and Vulpian, showing that the spinal marrow is, at least in frogs, as important as the *medulla oblongata* in affecting the tonicity of blood-vessels.

M. Louis Henry contributes an elaborate paper on "The Products of adding Hypochlorous Acid to Allylic Compounds," which does not admit of intelligible abbreviation. He arrives at the conclusion that the hypochlorous acid divides itself into two parts, chlorine, and hydroxyl, which severally unite to two of the three molecular groups of which he supposes allyl to be formed.

M. Alfred Gilkinket contributes "Morphological Researches on the Pyrenomyces," commencing in this paper with *Sordaria fimicola* (Sphaeria f.) or Asses' Dung Sphaeria, the development of which is illustrated by numerous drawings. It appears that the spores of this little fungus are provided with two membranes and surrounded by a gelatinous substance which swells up on contact with water. At one pole they are perforated by a canal or "germinative pore" through which the endospore and protoplasm pass to form the vesicle from whence the first mycelium threads grow. After five or six days, one of the mycelium cells buds, and gives rise to a tube which rolls itself into a spiral, much like what M. de Bary observed in Eurotium. This is the *carpogone*, or female organ. The male organ (*pollinode*) is formed at its base, and the two enter into combination, either directly or by endosmotic communication, the former seeming most probable. M. E. van Beneden remarks that these observations confirm previous intimations of the sexuality of the Ascomycetes.

M. Edouard Morren communicated a note on "The Mechanical Theory of Heat as applied to the Growth of Plants." He remarks that M. Barthélemy spoke of the growth of a Bamboo in the Jardin des Plantes, Montpellier, at the rate of a centimètre per hour, last July, as an act that

ought to coincide with the fixation of a considerable quantity of carbon. Such coincidence he considers unnecessary, as the carbon fixed in the green organs of plants by the decomposition of carbonic acid under solar influence, is not immediately applied to the formation of the tissues of new organs. The materials of growth are supplied by organic matters previously elaborated, and their application to the requirements of growth is accompanied by an expenditure of force needed for their circulation and transformation. We often see plants grow, or sprout, when they do not fix any carbon. Tubers, bulbs, buds, and seeds, at the time of sprouting, not only fix no fresh carbon, but lose a certain quantity of that element in the course of their respiration, and the heat furnished by this combustion occasions the motions necessary for the sprouting. (*Bulletin de l'Académie Royale des Sciences.*)

In clearing a cave near the mill of Liesberg, Canton of Bern, a number of bones and stone implements were discovered, which have been examined by M. Quiquerez, of Bellerive, and Professor Rüttimeyer, of Bale. The bones were recognised by the latter as remains of animals of the glacial period, amongst them being reindeer horns and bones of species still in existence. The stone implements are of the same description as those lately collected by M. Quiquerez near Bellerive, along with a great number of bones, imbedded in the alluvium, of deer of different species, the wild boar, the *Bos primigenius*, a fragment of a tooth of a mammoth, &c., all dating from the quaternary epoch. It will be remembered that about a year ago M. Quiquerez found traces of man from the antediluvian period in that locality. His former observations have now been fully confirmed, and M. Quiquerez intends publishing shortly the results of his researches in a pamphlet.

The Aromatic Substance of Vanilla.—M. Hoffmann lately presented to the Society of Biology, Paris, a paper by two of his pupils on "The Synthesis of the Aromatic Substance of Vanilla," showing that the cambium of conifers contains a crystalline substance belonging to the group of glucosides, which when brought in contact with emulsine breaks up into glucose (grape sugar), and a crystallisable body which when treated with an oxidising agent, like bichromate of potash, produces crystals containing the aromatic material. (*Revue Scientifique.*)

Polymorphic Butterflies.—The *American Naturalist* for May contains a paper by Mr. Samuel H. Scudder on this subject, from which it appears that the researches of Mr. Edwards show the Ajax butterfly to appear under three distinct forms, which have been named Walshii, Telamonides, and Marcellus. Usually the imago exhibits "seasonal polymorphism," Walshii appearing in early spring, Telamonides in late spring, and Marcellus in summer and autumn. Mr. Scudder observes that "Telamonides appears not to be the direct consequence of Walshii, but both are made up of butterflies which have wintered as chrysalides, those which disclose their inmates earliest producing Walshii, the others Telamonides; while all butterflies produced from groups of the same season—and there are several successive broods—belong to Marcellus." Such facts have an important bearing on the origin of species.

Limiting Noxious Insects.—In a paper in the *American Naturalist* for May a curious experiment, made by Captain Beebe on the recommendation of Dr. Le Baron, State entomologist for Illinois, is described. It appears that the oyster-shell bark louse of the apple tree, a very noxious parasite, is subject to the attacks of a little four-winged insect, aphelinus (*Chalcis mytilaspidis*), which pierces the scale of the bark louse, and lays her eggs inside. The grubs of the aphelinus, hatched from these eggs, devour the bark louse and her young. Captain Beebe placed some apple twigs, believed to have been operated upon

by the aphelinus, on trees badly infested with the bark lice, and in the following year there appeared reason for supposing that specimens of aphelinus had been reared and acted in their usual way upon the bark lice. As the aphelinus is only one twenty-fifth of an inch long, and the hole she makes invisible without a magnifying glass, Dr. Le Baron thinks the experiment scarcely conclusive, though decidedly encouraging, and he advises further efforts to naturalise this enemy of the bark-louse in the northernmost part of Illinois, where it has not hitherto been found.

Hermaphroditism in Eggs.—M. Balbiani has recently exhibited to the Society of Biology, Paris, a number of eggs laid by silkworms that had not coupled. He stated that many of these eggs remained sterile, but that some were in process of development, though none had hatched. The number of these fecund eggs varied according to the species of the silkworm moth from which they came, the greater part being produced by those races which had several broods in a year. Out of 9,000 eggs of a polyvoltine race, 513 hatched spontaneously; while out of 50,000 of an annual race, only twenty-nine were fertile. This enormous difference probably arose from the feeble vitality of the eggs in the annual kinds; but however this might be, he thought the general fact could only be explained by supposing the hermaphroditism of the egg. (*Revue Scientifique*.)

Phosphorus in Steel.—At a recent meeting of the Society of Civil Engineers, in Paris, M. Euverte, director of the works of Terrenoir, explained the present state of the manufacture of phosphorised steel. It was not, he said, a question of purposely introducing the phosphorus in iron which did not contain it, but of how much might be left in without damage. From experiments made, it appeared that phosphorus might be introduced into cast steel on condition of eliminating the carbon; the less carbon left, the more phosphorus the compound might have. Steel containing about three and a half thousandths of phosphorus and one and a half thousandth of carbon was very malleable, and furnished rails of excellent quality, which lasted five or ten times as long as iron rails. It was reckoned that there were three millions of tons of old iron rails in France, six millions of tons in England, ten millions of tons in America, and ten millions of tons in the rest of the world capable of being transformed into the new steel.

The fifty-second fasciculus (making the fifth of the seventh volume) of the great Sanskrit and German Lexicon, published under the auspices of the Imperial Academy of Sciences at St. Petersburg, by Drs. O. Böhtlingk and R. Roth, has lately reached this country. It comes down as far as the root *sarj*. As *s* is the last letter but one of the Sanskrit alphabet, it will be seen that the lexicon is approaching its completion. The same word *sarj* occurs in p. 907 of Wilson's *Sanskrit Dictionary*, 75 pp. from the end of the work, which contains in all 982 pp. The work of the two German lexicographers is a monument of the industry, accuracy, learning, and scientific scholarship—and in its Vedic department, of the acuteness and originality—of its authors. A large portion of the fifth volume is occupied by additions to, and improvements of, the previous parts of the dictionary; and the authors will no doubt have further additions and improvements to make at the end of their work.

MESSRS. WILLIAMS & NORGATE will shortly publish a new work on Ecclesiastes, containing an introduction to the book, an exegetical analysis, and a new translation with critical notes by Mr. Thomas Tyler, M.A. Mr. Tyler published a small pamphlet, *Notes on Ecclesiastes*, which was favourably noticed by Ewald in the *Göttinger Anzeiger* and by Kuenen in the *Theologische Tijdschrift*.

DR. RICHARD MORRIS received the honorary degree of M.A. on May 28. He was presented

by Dr. Michell, the public orator, who in a Latin speech dwelt on Dr. Morris's publications in connexion with the Early English Text Society and the Clarendon Series, and recognised his great merits in having resuscitated a truly scientific interest in the early national literature of the country.

PROFESSOR WILMANS, of Strassburg, who was sent to Tunis to collect inscriptions for the *Corpus Inscriptionum Latinarum*, published by the Berlin Academy, has brought back about 130 impressions on paper of Carthaginian inscriptions, chiefly from Castle Manuba, near Tunis, where Von Maltzan found his fifty badly copied inscriptions. He has also discovered a considerable number of modern Punic inscriptions, some bilingual, in modern Punic and Berber, one in Latin and modern Punic.

IN our last number but one, we announced the completion of Dr. Graetz's *History of the Jews*. It should have been rather the approach to completion, for vols. ii. and iii. still remain to be published.

PROFESSOR MAX MÜLLER's edition of the *Rig-Veda* and the *Commentary of Śāyanāchārya*, the first volume of which appeared in 1849, will be finished this year. It has taken twenty-five years, which may seem a long time, but if we divide the number of sheets of the large and the small editions, we find that Professor Max Müller has printed every year during twenty-five years a volume of thirty-six sheets, i.e. 576 pages, 8vo, of Sanskrit text never published before.

MEETINGS OF SOCIETIES.

ROYAL GEOGRAPHICAL SOCIETY (*Monday, June 1*).

At the meeting of the above Society, the President introduced Chumah and Suzi, Livingstone's followers, and expressed his opinion that when the whole of their work was known, they would have such a tribute paid to them as Englishmen knew how to pay to duties strenuously performed. Chumah had picked up his knowledge of the English language while under Dr. Wilson, of the Free Kirk Mission in Bombay, whither he had accompanied Dr. Livingstone after their travels together in Africa. During the same period Suzi was on board ship.

Dr. Carpenter then read a lengthy paper on Oceanic Circulation, which want of space prevents us noticing here, but which, as the President pointed out, was on almost an entirely new science, which owed more to Dr. Carpenter than to any other living man for its development. His theories, moreover, had been signally corroborated by the results of the expedition of the *Challenger*. The lateness of the hour would prevent any discussion that evening, but Fellows of the Society would have an opportunity of expressing their views at the meeting of the British Association.

SOCIETY OF BIBLICAL ARCHAEOLOGY (*Tuesday, June 2*).

S. BIRCH, LL.D., F.S.A., President, in the Chair. The following papers were read: 1. "On the Phoenician Inscription 'Melitensis Quinta,'" by Professor W. Wright, LL.D. This paper reviewed the earlier readings of the inscription by the Duc de Luynes, Quatremère, Ewald, and Blau; and gave a revised text and translation, based on an examination of the stone itself. It was accompanied by a facsimile of the stone described.—2. "On an Egyptian Calendar of Astronomical Observations of the XXth Dynasty," by P. Le Page Renouf, F.R.S.L. This paper was a collection and a correction of the famous Calendar of Star Culminations, which had been published by MM. Champollion and Biot, the latter *servant* having, however, been misled by believing the papyrus to be astrological only. The text was accompanied by a full exegesis and a diagram of astral positions.—3. "On the Cylindrical Altar of Nectarhebos at Turin,"

by Joseph Bonomi (with two plates). This interesting monument—which, although noticed by Orcurti, is now published for the first time—is a large cylindrical altar of black granite, finely wrought, and covered with sixty-eight vertical lines of hieroglyphics, and four vignettes, representing the Pharaoh Nectarhebos of the XXXth Dynasty making offerings, and uttering adorations to the various deities of the four cardinal points.—4. "Translation of the Hieroglyphic Inscription upon the Granite Altar at Turin," by Samuel Birch, LL.B., F.S.A., President.—5. "Assyrian Notes," by H. Fox Talbot, F.R.S.: (1) "The Use of Papyrus among the Ancient Arcadians." In his recent investigations as to the original meanings of some of the Assyrian roots, Mr. Fox Talbot found that the terms Nazabu Shakani, "the stem of a reed," and Nigris, "a volume," and "writings upon vegetable skin," occur among the Assyrian inscriptions published by the British Museum, thus attesting the accuracy of the statement of Pliny, that the Papyrus was so used by the Babylonians—a fact which, till Mr. Sayce first called attention to it, had been disputed. (2) "Assyrian Books." In this paper the following sentences were adduced to show that the Assyrian literature was not confined solely to inscriptions upon tablets of baked clay: "In the night-time bind around the sick man's head a sentence taken from a good book" (for a charm); and "care not to save the newly-written books," &c. (3) "On the Amount of Accuracy now sometimes attainable in Assyrian Translation."

LONDON ANTHROPOLOGICAL SOCIETY (*Tuesday, June 2*).

THE discussion on Miss Wallington's paper, "The Physical and Intellectual Qualities of Woman Equal to those of Man," was resumed, and a paper was read by Mr. C. Staniland Wake, on "Cannibalism." After tracing the area within which cannibalism is known to have been practised, the writer considered the motives assigned for the custom by various tribes, and their general condition of culture; and showed that the cannibalism of the light, straight-haired peoples is chiefly a form of revenge, while that of the dark, negroid peoples probably originated at a time when the moral faculty was but slightly developed, under the influence of the instinct of self-preservation.

ROYAL MICROSCOPICAL SOCIETY (*Wednesday, June 3*).

A VERY remarkable specimen of the manipulative skill of Herr Müller was exhibited at this meeting by Mr. Baker, and highly praised by the secretary. In the centre of an ordinary slide was a square piece of photography one-tenth of an inch in size, containing eighty clear circular spaces surrounded by a dark framework. In each space a diatom was placed exactly in the centre, and beneath it its name in plain letters, with a reference to the authority for it. The whole group could be clearly seen at one glance under a 1½-inch objective, and the lettering, just readable with that power, was so fine, that when a ½ objective was employed, a name as long as *Triceratium formosum* did not exceed the size of the field.

ROYAL SOCIETY OF LITERATURE (*Wednesday, May 27*).

C. GOOLDEN, Esq., in the Chair.—Mr. C. H. E. Carmichael read a paper "On Veronese Typography (Fifteenth to the Nineteenth Century), with a Notice of the Giuliani Press and of Sanmicheli's Capella Pellegrini at Verona," in which he gave a full and curious history of the progress of printing at Verona, and mentioned some of the most remarkable works which were given to the world by Veronese printers. The earliest work known to have been printed at Verona, is *Veturius de Re Militari*, A.D. 1472, which is celebrated alike for the beauty of its type as for the number and excellence of its woodcuts. Two other famous books are the *Divina Commedia*, in the

same year, and an edition of Petrarch, in 1476. The number of books printed at Verona before 1600 is very remarkable. Indeed, the invention of printing has been claimed for that city, though without any sufficient grounds. The early type is the good round Latin one, much resembling that first used at Rome.

FINE ART.

MR. BURGESS' MODELS FOR THE DECORATION OF ST. PAUL'S CATHEDRAL.

THE exhibition of Mr. Burgess' models in the architectural room of the Royal Academy is an invitation to criticism. It is impossible, however, to treat them simply by themselves, or to avoid taking into consideration the general scheme of which they form a part. No church is considered at the present day "correct" until it has been, as the phrase is, "restored," and accordingly a so-called Restoration of St. Paul's has been going on for some years in a fitful, hesitating sort of way. The authorities appear to have had a vague feeling that they ought to do something, though what should be done no one exactly knew. Public opinion required that St. Paul's should be restored, without giving any more definite indication, and the authorities have acted in accordance with public opinion. Since 1858, when the works commenced, the organ has stood in three different parts of the church; a monster organ has been put up in the south transept, and has been taken down again; the stalls have twice been rearranged; and lately the whole floor of the choir has been raised a step or two, with no very obvious intention. Many windows have been filled with Munich glass, which it is now proposed, very wisely, to remove; the vaulting in the choir and elsewhere has been painted and gilt, only to give place, as we are now told, to stucco and mosaic; and the interior has undergone a costly process of scraping to produce a new and clear surface, which Mr. Burgess is to cut away and replace with marble. The Wellington monument, designed originally to occupy one of the arches of the nave, is now being erected in the chapel which used to serve as the consistory court. By this change the whole motive of this fine design is lost, and the tomb has the effect of a large four-post bedstead standing in a small dressing room. The altar has been moved out of the apse, which is to be occupied instead by the consistory court; a quaint arrangement, probably intended to symbolize the supremacy of the law. The only decided step which has been taken is the destruction of Wren's screen and the entire alteration of his choir arrangements. This change is greatly to be deplored. The dome forms the commanding feature of the interior: it cannot be treated as a mere lantern tower; it must form the point to which the climax of the entire design works up. The nave and transepts must be treated as leading up to the dome, the whole effect centering and finishing there. Wren provided for this effectually by erecting a very massive and noble screen surmounted by the organ, thus completely separating off the choir from the dome-space. The removal of the screen has proved conclusively the wisdom of its erection. The choir now gives the effect of a gloomy tunnel, at the extremity of which a small altar may be described by those who happen to be placed in the centre of the dome. It is surely too obvious to need enforcing, that the dome is the grand and governing feature of the whole design, and that the choir must be considered as altogether distinct, having its own proper treatment working up to its own altar in the apse. It is simply the chapel of the canons, where their services are performed at their own altar. This is as far as it was possible, in Wren's time, to carry the matter; but as the cathedral is now happily used for great popular services, altogether independent of and in addition to the regular service of the chapter, it becomes necessary, of course, to erect a second altar to meet the new requirements. A people's

altar under the dome is what we may be sure Sir Christopher had in view in his design. He had conversed at Paris with Bernini, who had erected the great baldacchino under the dome of the Vatican Basilica, and there can be no doubt of his opinion as to the proper treatment of the dome space. Indeed, his original and favourite design, the model of which is now at South Kensington, points to this arrangement, and to nothing else. A dome such as this, designed as it is for great popular assemblies, demands a grand people's altar. Nothing short of this will be satisfactory to men of taste, and nothing less will meet the wishes of those who frequent the services of the cathedral. It is creditable to the architectural profession, that all the members of it who have published their opinion upon this question (with the doubtful exception of Mr. Penrose) have taken this view. Wren did all that he could to prepare for this grand completion of his work by cutting off the choir, in the most effectual way, from the dome and the nave by the screen and organ. Of this fine monument it may now be said, "si quaeris, circumspecte," for it is scattered in fragments all over the church. The first step to a satisfactory treatment of the cathedral will be its reconstruction and restoration to its original position.

The screen was removed in order, as we were told, to throw the choir open to the dome, and so to introduce on a large scale the arrangements of a parish church. But it has been found, as any architect might have foretold, that it is quite impossible to use the two portions of the church together. At the great services the singers are not placed in the choir at all, but in the eastern portion of the dome-space. Placed in the stalls they would not be heard at all. The choir now glooms before the congregation, a vast empty expanse of darkness. It does seem a monstrous thing that so fine a work of art as the screen and the organ upon it should have been broken up into fragments, for nothing else whatever but to prove the impossibility of using the dome and the quire at the same time.

The dome altar should of course be surmounted by a baldacchino. I am aware that this feature has been condemned by an ecclesiastical judge, but the decisions of such courts are of no great account in art, and cannot certainly be allowed to stand in the way of a great architectural improvement which is quite free from any party significance.

Passing now to the examination of the models which have given occasion to these remarks, two main criticisms suggest themselves.

The great defect of the interior of the church is that the light is admitted mainly at a low level.

It is essential to a dignified internal effect that the light should enter from above. In consequence of the large size of the aisle windows, and the gloomy colouring of the dome itself, this most important element of design is lost. The correction of this defect must be the first aim of any reasonable scheme of decoration. The clerestory windows should be filled with stained glass of a bright silvery tone, and the central body of the church kept as light in colour as possible. The aisle windows should be treated with glass of a rich and sumptuous character, and the colouring of the walls kept rather dark. This principle does not appear to have occurred to Mr. Burgess. As far as can be judged from the models at Burlington House, the lower portions of his design are the lightest, and the richer colours are reserved generally for the vaults. The aisles, too, which ought to have been kept down in tone, in order to give the utmost effect to the light admitted by the clerestory, are treated with as much or even more white marble than the central space. There seems to be a want of a true grasp of the problem. The plan, with much ingenuity in detail, appears that of a clever man working in a style which he does not enter into. There is

no objection on principle to the substitution of marble for stone, but the marble ought to be introduced only where Wren would have used it had he possessed the means. He would, I conceive, have employed it only for the pilasters and panels, and not have lined his whole walls with a marble veneer. The adoption, moreover, of white marble seems to be a great mistake. The cold, bluish tone of white marble would be singularly unfortunate in our London atmosphere. Even the Greeks, having at their disposal the beautiful marble of Paros, toned down its rawness with a saffron stain. The effect of ordinary white marble when the joints become emphasised, as they very soon must be, with soot, would be far from agreeable.

The second criticism to be made is that the design for the decorations is not conceived in the same spirit as the structure. There is an evident hankering after Renaissance, and the absurdity of decorating St. Paul's in Cinque Cento is parallel to that of painting a fifteenth century church in the Early English manner. This tendency is shown very unfortunately in the treatment of the flat domes—in the vaulting both of the choir and aisles. These, instead of forming broad spaces for painting or mosaic, are to be broken up by a circle of stucco ornament in their centre, and by radiating lines cutting up the surface into small panels, which are to be occupied by little busts. Such a treatment belongs altogether to an earlier style. It would be better not to attempt the thing at all unless it can be done by one who can handle the style *con amore* as his own. If marble is to be introduced, it is not to the Cinque Cento style that we should look for models, but to such works as the Church of Sta. Maria della Vittoria, and the Borghese Chapel in the Liberian Basilica at Rome. These fine works, though somewhat earlier in point of time than Wren's date, are to all intents and purposes in the same style as our cathedral, since we were always in this country much behindhand in the development of the Italian style. On the whole, the inspection of the models leads to the conclusion that it would be better to leave the church alone. The man capable of so great a work has yet to be found. Mr. Alfred Stevens, the author of the design for the Wellington memorial, might have been equal to the undertaking, but there is no one else who could be expected to succeed where Mr. Burgess has failed. We therefore arrive to the humiliating conclusion that the time for the decoration of St. Paul's has not yet come. No committee, however capable, can create the man required for such a task; and failing this, it is to be hoped that the proposal may be indefinitely postponed. The restoration of the screen and the erection of the dome-altar and its baldacchino are quite as much as, under the circumstances, we can hope to see satisfactorily carried out in our time.

G. GILBERT SCOTT, JUN.

THE PRINTS IN THE "SALON" OF 1874.

THERE are exhibited in the present French Salon nearly three hundred frames of engravings—that is, line engravings, woodcuts, and etchings—but as very often many small prints are in one frame, the number, considerable as it is, does not give any idea of the importance of these arts among the French public of our day. The line engraving most spoken of is a large head of Pius IX., by M. Gaillard, who took a drawing in Rome of his Holiness's head, and has worked upon the plate chiefly in Paris. Indeed, he was working upon it only a few days ago, so that the print in the Salon must be considered an *épreuve d'essai*. It is a very brilliant and highly finished work: more delicate than strong, though the modelling the face is of elaborate and learned. His Holiness is always represented with the same expression. Of engravings after the works of other masters we noticed the last trial-proof of M. Bertinot's reproduction of M. H. Lehmann's portrait

of Monseigneur Darboy, and a large work by M. Auguste Blanchard: *La Fête des Vendanges à Rome*—Alma-Tadema's celebrated picture. M. Manet's picture of a fat fellow at a boulevard café, seen in our Dudley Gallery under the title of *Le Bon Bock*, loses none of its character in M. Ernest Boetzel's woodcut.

Of etchings there are very many. Indeed, the art of etching is just now so fashionable in France, that it would be unreasonable to expect to find a large proportion of the work to be of a high order. There is much of what is technically very second-rate, and there is also a much smaller proportion of original work, either good or bad, than has heretofore been the case; many of the younger etchers, and one or two very famous ones among their elders, employing themselves in copying other people's pictures. Of labour of this sort there are some extremely favourable examples. Flameng's *Ronde de Nuit*, after Rembrandt's picture at Amsterdam, is in its way a great work, though it does not appear to us to be to the full as remarkable as his recently-finished "Hundred Guilder Print;" but in the one case an etcher was copying an etching; in the other he was copying a painting. Peter de Hooghe's works among the Dutchmen, and Decamps' works among the French, lend themselves somewhat readily to reproduction, or, at least, are of the kind that amply repay this reproduction. M. Charles Courty takes *La Partie de Cartes*, and translates it into black and white. The lighting is good, and so is the texture of the marble columns of the chimney-piece; but Rajon's reproduction of a De Hooghe—*Cour de Maison Hollandaise*—is, perhaps, still finer and more characteristic. Its elaboration has not once led the artist to forget that he is an etcher: the frank etched line is everywhere on his plate. The Decamps—an *Intérieur de Cour en Italie*—by M. Brunet-Debaines, is a very fine proof from the Wilson catalogue: the subject is one of the most powerful etchings in that book. M. Courty, of whose De Hooghe we have already said a word, distinguishes himself by a figure-subject, after Gérôme, called *Le Bain*. The white woman is drawn and modelled with the utmost delicacy—it is one of the most successful nude studies we have seen in modern etching, which is not generally rich in such work.

Of original things, Lalanne contributes a great many. Some of them, done for an illustrated publication, do not do him justice. There is a clever effect of snow in *Le Pont de Sèvres pendant la Guerre*. *Les Roches Noires* at Trouville has more vigour than Lalanne often aims to possess: the black sky is of that kind which Rembrandt has given us in *The Three Trees*—we speak, of course, of kind, and not of merit. A still more elaborate and effective sky—a sky, indeed, far more elaborate and effective than one often sees in etching—is attempted and partially realized in another of M. Lalanne's works, in which the setting sun, just below a bank of well-rounded cloud, throws rays over all that is light and clear. M. Feyen Perrin has two slighter works—both in the environs of Auray, Morbihan—and both are good in their effects of tranquil placid light in open country. A work by an artist whose name is new to us—M. Aufray de Roc'hbian—is striking and important, and were it not for its somewhat muddled sky, would be highly satisfactory. It is called *La Berge*, and is a poetical rendering of a river scene, with a dark foreground of boat by the bank and overhanging trees: a good half-light on the resting figure of the man in the boat, a bright broad river, and delicate distance, and, on one side, a group of wind-swayed poplars, drawn particularly well. In *Le Village d'Artemare* (Ain), M. Appian has his favourite effect of twisted gnarled and knotted tree-boughs—writhing somewhat too much alive—and standing dark against a clear and distant sky. These are a few out of the many etchings exhibited. The *renaissance* of the art promises much, and will perform it if its

practitioners recognise three things—first, that the fascination of the process must not be allowed to lead to its practice apart from the serious care given perhaps more habitually to other mediums of artistic expression; second, that the cleverest copying in the world, immensely ingenious and interesting as it may be in the hands of Flameng and Rajon, can never realize the full range of the art; and third, that the art is an wholly independent one, in which both the manipulation employed and the effect attained by the ordinary line engraver are rather to be eschewed than sought for.

F. WEDMORE.

CHARLOTTENBORG.

Copenhagen: May 15, 1874.

POSSIBLY not every reader is aware that the Royal Academy of Arts in Denmark has its abode in King Frederick V.'s old palace of Charlottenborg. Here since 1754 has been held the annual exhibition that is to Danish art all that the Salon is to French, and far more than the Royal Academy contrives to be to English art. Like the old Royal Theatre, the old Charlottenborg is passing through its last hours. The zeal that is rebuilding so much of Copenhagen, and pulling down so many structures not beautiful in themselves indeed, but rich in historical and literary memories, has put its woodman's mark against this also. A building is already being prepared on the grounds of the present Botanical Gardens, in which it is proposed to hold the annual exhibition of painting, and visitors will no longer have to wander through the loose-strung, disjointed rooms of poor old-fashioned Charlottenborg.

Of the four hundred works exhibited this year, it may at once be broadly admitted that the average standard is not very high. To be sure there are hardly any pictures here quite as low in point of merit as the worst that stare us in the face at a certain annual and national collection on the north side of Piccadilly. On the other hand, we miss at Copenhagen several whole classes of art successfully treated in London. First and foremost, the peculiar kind of historical *genre* represented so abundantly amongst ourselves by Messrs. Orchardson, Pettie and Marks is entirely wanting: the fashionable-society art, of which Mr. Frith is the Michael Angelo, is hardly discoverable at all in this old-fashioned capital of the North; those deplorable canvases filled with high-coloured gentlemen in pink are totally absent in a country where "vulpicide" is still a virtue. The present collection mainly consists of landscapes, portraits, and a few, usually particularly good, *genre* pieces.

But the one great picture of the year belongs to neither of these divisions. For Charlottenborg this year presents one single work that deserves the denomination "great" in the fullest significance of that word. The hangers have kept their best wine until now, for although Charlottenborg has been open to the public for several weeks, Carl Bloch's *Samson and Dalilah* only now finds its place in the largest room. Carl Bloch, whose *Samson at the Mill* made a European fame for him some few years back, has produced in the interim no work that could compete in interest with that wonderful study. In that picture, as most readers will remember, the blind and morose giant turns the great mill with a dull action of his vast limbs, now renewing their strength, while an impish old man, seated on the top of the quern, relieves his patriotic zeal by lashing the bound and naked Hebrew. The force and almost brutal realism of that work recalled to mind the dazzling savageries of another young painter, even more highly gifted, the lamented Henri Regnault. In this new work of Carl Bloch there is the same force, and even more magnificence. It is a picture of unusual dimensions, and the figures appear (but I suppose only appear) to be of heroic size. Over the central group there hang and divide rich curtains of a sultry-yellow colour, that seems to give suggestion to the thought as well as the tone

of the picture. Under this tapestry Dalilah, with her long red hair thrown back and scattered over the pillows, holds the head of the sleeping Samson on her knee, and while with one hand she beckons the Philistine elders to come in, with the other she throws down on the floor the last lock of the hair that gave the hero his mystical power. Her face is a triumph of imaginative execution: the greed of gold, the excitement of a new experiment, the satisfaction of satiated curiosity, all are expressed in the eager and flushed face, wan about the temples, weary in the eyes, but flushed at least with hope and triumph in the deed securely done. The modelling of her form leaves nothing to be wished for: there is in it something of the unflinching realism one expects from such young painters as Bloch and Regnault, who insist on being even too cruelly true to physiology and to the experiences of passion. The half-nude figure of Samson fills the foreground, and the realisation of the knotted sinews relaxed in sleep is finely rendered. Perhaps the skin is too soft and velvety for a man of the age and character designed. The accessories are wonderfully well painted; a lion-skin under Dalilah's feet in particular. The feeblest section of the work is the group of the heads of the Philistine elders.

In landscape Skovgaard is pre-eminent, as usual. Of the four excellent pictures he exhibits, one, a bay of the sea, with wooded hills behind, and cows by the water (216), is a triumph of dreamy colour, and the best landscape to be found here. A young artist, Vilhelm Groth, whose name is new in Danish painting, sends six landscape pieces of very unequal power, one of which, at least (83), a study of stagnant water on the mosses of Jutland, is in the highest degree clever and original, the way in which the oblique light strikes the water being masterly in its sterling veracity. La Cour, Kyhn, and Eilersen may also be named as landscape painters whose works rise decidedly above the level of excellence here. Among portraits, one of Dean Fog by Vermehren, and one of Bishop Martensen by Krøyer are noticeable, the first for its extreme delicacy of handling, the second for its vigorous and lively realism. After mentioning two audacious studies in the nude, Jerndorff's *Moses lifting up the Serpent in the Wilderness* (113), where the violent sunlight and purple shadow of the tent divide the body of a young girl that strains herself up to look at the serpent of brass, and Kristian Zahrtmann's cartoon of *Job and his Friends*, an astounding piece of realism and good draughtsmanship, to which the gold medal of the Academy has been awarded, there remains not very much that claims special attention from non-Danish students. But the exhibition, on the whole, must be pronounced a good one, even if Bloch's picture be put out of consideration. The Danish painters are certainly advancing in their ability to perceive and render colour.

EDMUND W. GOSSE.

ART SALES.

At a sale in the Hôtel Drouot, April 27 and 28, the paintings fetched the following prices:—Molenaar, *Dutch Kermesse*, 3,300 fr.; Van der Neer, *The Yawl by Moonlight*, 11,000 fr.; Landscape by moon-light, same artist, 6,000 fr.; Netscher, *The Singing Lesson*, 13,200 fr.; Pynakker, *Italian landscape*, 5,700 fr.; Vlieger, *The Moerdijk*, 5,100 fr.; Verschuur, *The Meuse by Dordrecht*, 24,500 fr.; Guardi, *The Place of St. Mark*, 9,000 fr.; Bassano, *Portrait of Vesalius*, Professor of Anatomy at Bologna, 1,900 fr. Among the modern paintings were—by Decamps, *Souvenir of Fontainebleau*, 2,980 fr.; Delacroix, *Lion devouring a Rabbit*, 35,200 fr. *Apartment of the Count de Mornay*, 4,200 fr., and *The Bride of Abydos*, 32,050 fr.; Diaz de la Pena, *Fontainebleau*, 32,700 fr., and *The Pack*, 1,920 fr.; Dupré, *The Hollow*, 17,000 fr., and *English Pasturage*, 16,000 fr.; Fromentin, *Women of the Desert returning from fetching Water*, 4,150 fr.; Gérault, *Trumpeter of the*

Orleans Hussars, 6,560 fr.; Leys, Baron, *The Workshop of Rembrandt*, 1,100 fr.; Marilhat, *Caravan passing a Ford*, 9,600 fr., and *The Caravan*, 7,150 fr.; Millet, *Return from the Fields*, 8,200 fr., and *The Distaff*, 8,000 fr.; Regnault, *The Countess de Barck*, 33,560 fr.; Troyon, *Still Water*, 26,000 fr., *The Cart*, 24,000 fr., *The Norman Farm*, 7,100 fr., *Souvenir of the Pyrenees*, 3,500 fr., and *Cattle in a Wood*, 3,930 fr.; Ziem, *Venice*, 4,500 fr.

THE sale of the works of Carpeaux realised 25,000 fr.: *The Neapolitan Fisherman* sold for 3,600 fr.; and *The Girl with the Shell*, 4,700 fr.

THE sale at Messrs. Christie's, on the 27th ult., consisted of a collection of old English furniture of the eighteenth century, formed by the late Mr. Morant, whose taste and judgment in all connected with art-furniture were most refined. Who would have thought, some years back, that the mahogany and satin-wood chairs and tables, discarded to the nurseries or the offices, should again reappear as the fashionable furniture of the day? The works in mahogany of Chippendale, Adam, Heppelwhite, and Sheraton, are all remarkable for fine bold carving, acanthus scrolls, and architectural mouldings, pierced and fretwork, put together in a workmanlike manner, and of well-seasoned materials. The prices obtained were as follows: Of Chippendale were—(Lot 2) A chimney-piece, with richly carved frieze of flowers, 43*l.*; (35) six chairs, 15*l.* 14*s.* 6*d.*; (36) a corner chair, 16*l.* 1*s.* 6*d.*; (37) a double chair, 18*gs.*; (49) a table, 9*gs.*; (51) another, with pierced gallery and channelled legs, 7*l.* 15*s.*; (57) a two-leaved screen, fret-cut panels, 20*gs.*; (120) *escritoire*, 31*gs.*; (121) another, 32*gs.* Of Chippendale's looking-glass frames, so delicately modelled after the French style, with Vauxhall plates, there were only two small examples, 30 and 32, which sold for 8*gs.* and 9½*gs.* Heppelwhite's chairs, richly carved, with oval backs, sold (22) five for 14*gs.*; (23) two for 7*l.*, and (27) three of most exquisite design, 8*l.* 5*s.* Sheraton's mahogany chairs, shield-shaped and beautifully carved, sold—(22) five for 14*gs.*; (23) two for 7*l.*; (25) eight for 21*gs.*, and (26) six for 25*l.* 14*s.* 6*d.* The beautiful satin-wood furniture, banded with tulip and other woods, for which Sheraton was famous, sold well. (9) A pair of satinwood and inlaid pole screens, 20*l.* 9*s.* 6*d.*; (128) a satinwood and mahogany *escritoire*, 40*l.*; (47) a Pembroke table, elaborately painted (for Cipriani, Angelica Kauffman, and the first artists used to paint the furniture in the eighteenth century), 17*l.* 6*s.* 6*d.* Many other pieces sold at equally high prices, and (147) the President's chair of the Cauliflower Club (a club of booksellers who held their meetings in the city), a fine specimen of Chippendale's workmanship, the back surmounted by a large cauliflower (13*l.*), closed this remarkable sale.

THE following pictures, the property of the late Mr. James Eden, of Fairlawn, Lytham, were sold on Saturday by Messrs. Christie, Manson, and Woods. The prices are stated in guineas:—R. Ansdell, R.A., *A Highland Gilly-boy, with Deer-hounds*, 125; *Disputed Prey*, 200; *The Wounded Hound*, 1,050; *Lytham Sand-hills*, 310; *Fallow Deer*, 240; *The Drover's Halt*, bought from the artist, 580; *The Gossips*, 700. T. S. Cooper, R.A., *A Scene in Dovedale*, 300; *A Sunny Landscape*, 420. T. Creswick, R.A., *On the Tees*, 290. W. Etty, R.A., *To Arms! to Arms! ye Brave!* 180. E. Frère, 1865, *Evening Prayer*, 310. W. P. Frith, R.A., *Dolly Varden*, 200; *A Scene from Woodstock*, 250; *Mary Avenel*, 160. W. E. Frost, R.A., *Venus disarming Cupid*, 130. F. D. Hardy, *Early Risers*, 170; *Reading a Will*, 500; *The Afternoon Nap*, 200; *The Sweep*, 610; *The Broken Window*, 270. J. C. Hook, R.A., 1850, *The Escape of the Duke of Carara*, 160. J. C. Horsley, R.A., 1853, *The Pet of the Common*, 440; J. Linnell, sen., *A Road Scene, with cattle at a pool*, 900; *Windsoor Forest*, 500; *Sheep*, 960; *The Gleaner's Return*, 810; *Milking Time*, 1,105; *The Woodlands*, 800; *The*

Dairy Farm, 600; *The Last Gleam before the Storm*, 2,500; *The Windmill*, 1,200. D. Maclise, R.A., 1854, *Prospero and Miranda* 140. J. Phillip, R.A., *A Spanish Countess*, 375; *The Scotch Baptism*, 1,755. P. F. Poole, R.A., *Fishermen's Treasures*, 550; *The Hawthorn Gatherers*, 660; *The Foster Brothers*, 520. T. Webster, R.A., *A Letter from the Colonies*, 600; *Spring*, 450; *Summer*, 510; *Autumn*, 290; *Winter*, 330. Henry Wallis, *The Room in which Shakspeare was born*, 101. R. Ansdell, R.A., *The Fight for the Standard*, 900.

AT the same time there were sold, water colours, a different property:—P. de Wint, *Fiskerton, Notts*, 215; *A River Scene*, 130; David Cox, *The Proposal*, 190; *Kenilworth Castle*, 105; *Aston Hall, near Birmingham*, 105; *A Lamb bleating over a dying Ewe*, 170. G. A. Fripp, *A Scene in the Forest of Glenorchy*, 115. Pictures:—M^{rs} Whirter, *Landscape, with a waterfall*, 255; A. Vickers, *On the Banks of the Ravensbourne, Kent*, 185; W. Müller, *Gillingham, Summer Evening*, 290; J. Linnell, sen., *Across the Common*, 510, *The Last Gleam*, 810; Copley Fielding, *A Classical Landscape*, 760; P. F. Poole, R.A., *A Girl at a Spring*, 150; Sir A. W. Calcott, R.A., *A Calm*, 135; C. R. Leslie, R.A., *Charles II. and Lady Margaret Bellenden*, 130; E. W. Cooke, R.A., *Venice*, 145; W. Müller, *A Welsh Interior*, 98, *Coblentz*, 90; T. Creswick, R.A., *Norwood*, 98.

THE sale of the pictures in Mr. Barker's collection will take place at Christie's on Saturday, and of the articles of *vertu* on the first three days of next week. Among the pictures are examples of Signorelli, Pinturricchio, Botticelli, and Piero della Francesca of unique value, such as will probably seldom find their way into the market again.

NOTES AND NEWS.

MESSRS. SOTHEBY advertise for sale, on the 9th and following day, a large collection of old Worcester porcelain of the highest quality; Chelsea vases with subjects after Boucher, and a turquoise and *cil-de-perdrix* tea-set, beautifully painted; Bow and Bristol figures; and, what is most remarkable, a series of transfer-printed Liverpool tiles by Sadler, embellished with portraits in character of the most celebrated actors and actresses of the last century. A great portion of this collection has been received from a house in Ireland, where it has been preserved for upwards of a century. It will be on view on Saturday.

A SET of Sèvres vases in the coming Barker sale bids fair to rival those of Mr. Goding and Lord Coventry. They consist of five *bleu de roi*, white and gold, one pair nineteen inches high, the other fifteen, with fluted necks and wreaths of foliage in relief in gold. The centre vase is oval, and is ornamented with four medallions painted with female portraits in *grisaille*, on *bleu de roi* plinth, mounted in ormolu. Mr. Barker purchased them from the collection of M. Fould.

THE Duke of Devonshire has sent two fine additions to the magnificent collection of lace at the International Exhibition—a flounce and a square or coverlet of the raised Venetian or rose point, of exquisite workmanship. The flowing arabesques and graceful scroll-work, the pearly edges and star-decorated ties of this splendid lace are all admirably rendered, and place these specimens among the gems of the collection.

AN advertisement appeared in March in some of the London papers, inserted by Mr. H. W. Birtwhistle, of Halifax, giving information of very uncommon interest to the admirers of William Blake's genius. It supplied particulars which had never before appeared in detail concerning the artist's illustrations to Young's *Night Thoughts*, a work which was thus shown to be the most extensive illustrative labour of Blake's life—far the most so, at any rate, in point of number of designs. The notification ran as follows:—“Young's *Night Thoughts*, with the 537 original

coloured drawings by Blake. Two vols. 21 inches by 16, red morocco. The letterpress, 8½ by 6½ inches, occupies the centre of each page; and around each page is the drawing, enclosed in a ruled and coloured border. The drawings are clean, perfect, and the colours are bright and fresh as when first put on.” These precious folio volumes are at present deposited in the hands of Mr. Rimell, the bookseller, of 400 Oxford Street, where we were allowed the privilege of inspecting them. Some of the designs were engraved during the painter's lifetime, as all Blake experts remember; but the number of these was only forty-three, so that the vast majority of the water-colours are wholly new to the eye. As was constantly the case with Blake, the conception and invention of the subjects are grand and impressive, and often startling, while the execution is not seldom primitive or vapid, with bright but faint clear washes of tint. It is possible that in some instances the colouring may not be Blake's own; as to this, however, we cannot express any very confident opinion. Many of the designs, more especially those in which the element of horror is conspicuous, are exceedingly fine; and the whole forms one more truly extraordinary monument of Blake's productive genius and energy. The question of purchasing these volumes for the British Museum has been mooted: it should, we do not hesitate to say, be settled in the affirmative. To the nation which gave birth to the great idealist the book is worth any price which could or would be asked for it.

PROFESSORS CURTIUS and Alder have returned to Berlin, after having satisfactorily organised the course of operations to be pursued in the excavations at Olympia, for which the German Imperial Government have made a grant of 100,000 thalers. Professor Curtius has recently published in a separate form (*Ephesus*: Berlin, 1874) the result of his examination of the site of the temple of Diana, which he made known to the public immediately after his return from Asia Minor, in an address delivered to the Scientific Society of Berlin. The *Ephesus* of Professor Curtius is, however, something more than a mere reprint of a popular lecture, and besides supplying its readers with a comprehensive history of the Ephesian city in its important commercial and world-renowned religious relations, such as only a man of his learning and research could give, it is enriched by admirable lithographic plates of the ruins as they now present themselves to the eyes of the traveller, with a plan of the city, and an elaborate ideal scheme, by Professor Adler, of the great temple in its integrity.

WE have seen the complete catalogue of modern etchings, published by M. A. Cadart, of the Rue Neuve des Mathurins. He has just issued it. It contains many small illustrations to show what etching can do, but we doubt if, for this purpose, the selection has been entirely wise: there is, however, a pleasant *croquis* of a village in Burgundy, by Maxime Lalanne, and a study of a horse in a stable, by Veyrassat. These are men who have rarely done a bad etching. We have likewise glanced over *L'Album Cadart*, a publication to which M. Burty, an eminent art critic whose work has recently been seen in these pages, has supplied the text. The text does not concern itself with the particular prints or particular masters with which the present issue of the *Album* has to do. To have balanced one against the other would have been an invidious task, and M. Burty has probably done well to confine himself to a general sketch of the revival of the art of etching in France—the art of which Méryon has been in France the greatest modern master. The prints in the *Album* are exceedingly unequal. Two of the most elaborate, by M. Martial and M. Delaunay, represent respectively *La Rue Saint Eloi, Ancien Paris*, and *Le Pont Neuf*. Both appear to have been inspired by Méryon, and both are a very long way behind him. Lalanne's contribution is good, because in his simplest subject

there is always grace. Legros is less happy, though his fewest strokes are charged with meaning. The print of the Japanese dancer by De Nittis has *chic* in it, and M. Hédouin's figure-subject shows how the modern dress of Parisiennes may be treated successfully in art. M. O. de Rochebrune has a fine study in a great carved chimney-piece to be found in La Vendée, and his disposition of light and shade is good: better, we think, than his texture. The most delightful and impressive subject, though in technical qualities it is perhaps not very powerful, is M. Feyen-Perrin's etching of *Les Filles du Pêcheur*. The theme is found where M. Feyen-Perrin finds his best inspirations—in the *presqu'île de Batz*: a Breton peninsula of granite rocks and salt marshes and lonely farms with scanty sea-side pasture land. On Croisic pier and on the giant boulders of the *grande côte*, where the great western sea is suddenly deep, the artist is at home amongst the type of peasant and fisher-wife beauty which is of all its kind at once the most vigorous and pathetic—pathetic with a strange and weird pathos which M. Feyen-Perrin has thus far been alone in seizing.

M. FRANÇOIS LENORMANT, the successor to M. Beulé, late Archaeological Professor at the Collège de France, has written to the *Temps* on the subject of Dr. Schliemann's excavations. Comparing the antiquities now brought to light with similar objects found in Cyprus, Rhodes, and Santorin, he inclines to think that they cannot be ascribed to a period later than 1600 B.C. They belong, he would fain urge, to an older Troy than that of Homer; more probably to that city which tradition said was built by Phoebus and Poseidon and destroyed by Heracles; or perhaps to that still more ancient one founded by Dardanus. There is a strong resemblance between the copper arms of Ilissarlik and weapons of the brazen age found in Denmark and the lacustrine dwellings of Switzerland; while the earthen vases sculptured with women's breasts in relief have direct counterparts in some found in Pomerania and on the shores of the Baltic.

This fact corroborates a theory recently advanced by M. Bertrand, the learned keeper of the Saint-Germain Museum, before Dr. Schliemann's doings were heard of, that the civilisation of the brazen age had its origin in the north of Asia Minor among the Chalybeian metal-workers. From thence, he contends, their manufactures were brought by eastern merchants along the route followed by the amber traders mentioned by Herodotus, past the Carpathian range, where to this day are found hoards of Greek coins, as far as the shores of the Baltic.

M. Lenormant concludes by expressing a sincere hope that Dr. Schliemann's treasures (which, though perhaps not Homeric, are still of priceless value) may be acquired by France.

A FORCIBLE article in the *Birmingham Daily Mail* of May 18 provokes attention to the question as to whether provincial museums should be aided by Government grants, or should be supported solely by the towns to which they belong. The writer points out that the South Kensington Museum was created wholly by means of grants raised by general taxation, and that if Londoners alone had been required to create it the chances are it would never have existed. This is perhaps true, but it is surely unfair to state that "the advantages arising from metropolitan museums have, until very recently, been enjoyed almost exclusively by whole 'wildernesses' of Cockneys, a comparatively limited number of country visitors only getting the 'lion's provider's' share thereof." For one Londoner who visits the Birmingham museums there would probably be ten Birmingham folk to visit the London ones.

Birmingham has long been conspicuous among manufacturing towns for its encouragement of the fine arts. Some of our best modern pictures have passed into its private collections, and its Free Art Gallery, built and maintained by the corporation, and opened every evening in the week, is an

institution of which it may well be proud. Aston Hall, also, is a museum of great interest, and that it is appreciated by the inhabitants of Birmingham is shown by the fact that 874,773 persons visited it and the Art Gallery last year. "All this," says the *Birmingham Mail*, "Birmingham has already done for herself, and more she is doing. . . . She has earnestly worked, subscribed freely corporately, and from private resources much help has been received; but Birmingham must be aided—her great claim to aid is what she has done already," on the principle that Governments should, like Providence, "help those who help themselves."

The especial aid that Birmingham now requires is for the creation of a gun-makers' museum, the foundation of which is already laid by the purchase by the Wardens of the Proof House of a large collection of continental arms. How far this projected museum may be made serviceable for industrial purposes, and to what extent the scheme proposed for it can be carried out, must depend on the help it receives. As such a museum would be one of national importance, it seems only right that it should demand national support. A provincial art museum has generally only a local celebrity, but a museum of arms, a great war museum, such as France is instituting in the Invalides, would have a significance for all the world, and no fitter place could be found for it than Birmingham, which employs at the present day 19,000 of her artisans in the manufacture of guns.

THE thirty-three subjects executed by M. Baudry for the new Opera-house will be exhibited at the Beaux-Arts, from the coming month of August till the beginning of winter. They cover a space of five hundred square metres, and all bear on the arts of poetry, music, and dancing in their varied developments.

THE *Levant Herald* states that the Turkish legation at Athens has addressed a protest to the Hellenic Government against the judgment of the Greek tribunals, rejecting its application for the sequestration of the Trojan antiquities found on Turkish soil by Dr. Schliemann, and since conveyed by the discoverer to Greece.

It is stated that the latest result of the excavations at Rome is the discovery of a magnificent bust of Matidia, niece of Trajan, and mother of Sabina, wife of Hadrian, which is in a perfect state of preservation, and is to be placed in the museum of the Campidoglio palace.

THE Salon Commission, composed of four presidents of sections, eight jurors, and M. de Chennevières, president by right, met last week to award the Salon medals. The médaille d'honneur for painting was for a long time closely contested by M. Léon Gérôme and M. Corot. At the first drawing M. Gérôme obtained five votes, and M. Corot three; at the second and third drawings, they were equal; at the fourth, M. Gérôme five, to M. Corot's three; at the fifth again equal. The sixth, however, determined the battle by giving M. Gérôme a majority of seven, against three. M. Henner, M. Paul Laurens, and M. Matejko obtained a few votes. The Médaille d'honneur for sculpture was given almost unanimously, without balloting, to M. Antonin Mercié. He obtained twelve votes, to one given to M. Paul Dubois. Medals of the first class in painting were gained by MM. Blanchard, Lehoux, and Priou; second class—MM. Billet, Castres, Girard, Gosselet, Guillemet, Hennebicq, Lecadre, Leroux, Monchablon, Munkacz, Gervex and Ponsan-Debat. In sculpture, the medals of the first class were gained by MM. Lafrance and Noël; second class—MM. Aubé, Caillé, Chrétien, Fourquet, Granet, and Lenoir.

THE Prix de Salon, a new award instituted by means of a ministerial decree on May 16, has not, according to the *Chronique*, been awarded this year on account of the opposition it provoked from members of the Institute. The Prix de Salon was founded to give a young artist of talent the means of studying in Italy for three years.

AN exhibition of the works of Maxime Lalanne is just open at the Cercle Artistique et Littéraire in Paris.

A ROMAN aqueduct was laid bare the other day in the excavations for the railway works from Payerne to Freiburg. The aqueduct, which is built of cement, and still in perfect preservation, served to supply the old Aventicum (Avenches) with water from the small lake of Leedorf, in the canton of Freiburg. Another discovery of Roman remains in Switzerland was made in digging a cellar in a house at Solothurn, when the workmen came upon remains of Roman walls and the traces of a hypocaust, the floor of which, as far as the excavations have reached, has been destroyed, but which, according to all appearances, may have been covered with mosaics. Above this supposed floor lies a black stratum, a sure sign of destruction by fire, perhaps at the time of the incursions of the Alemanni. The building in question must have stood within the radius of the old Roman castrum. In the *débris*, among other remains, four Roman coins were found, of which one has since been abstracted. This coin dated from the year 18 B.C., and is said to contain the heads of Augustus and Agrippa, his son-in-law, and was from the mint of Nemasus (Nîmes). Another, of the time of Constantine the Great, A.D. 335, is very well preserved. It is from the Trèves mint. The two others date from the reign of the Emperors Gallienus (263 A.D.) and Marcus Claudius Tacitus (275 A.D.) respectively.

SOME labourers at work in the Via Alessandro Manzoni, at Milan, have discovered a quantity of Roman coins, in number about 250, of the third century, mostly of the Emperors Claudius II., Aurelian, Tacitus, and Probus, all in good preservation, the greater part of copper, the others plated with silver.

THERE are now in course of demolition in Paris, Rue St. Martin, to the left of the façade of the Conservatoire des Arts et Metiers, several buildings raised on the grounds once possessed by the religious Benedictines of the Abbey of St. Martin des Champs. A thick wood formerly surrounded the Abbey at this spot, and from the most remote times the waters of Belleville and Mesnilmontant fed a fountain situated on the margin of this green wood. These waters were derived from some land owned by the monks, who, exercising municipal functions in the localities of their fief, had no difficulty in establishing means for bringing the water from the hills to the north of Paris down to head-quarters. This fountain—Fontaine du Vert-Bois—is to be preserved; it is one of the oldest fountains, perhaps the oldest, in Paris. As it is seen in the midst of the work of demolition, however, it does not date further back than the reign of Louis XIV. There certainly was at that spot, or very near it, an ancient fountain for the use of the Abbey, but the population of the Bourg, formed near the monastery, had no access to it. It was in 1712 that the Benedictines offered to the town a site sufficient for the construction of a public fountain. One of the conditions of the contract was that the fountain should be set up in an old tower of the convent, which had always been a boundary mark, and that a portion of the water should serve to supply the Abbey of St. Martin as the primitive fountain had done. The first stone of the new fountain was laid on August 12, 1712, by the authorities of the town. The tower was partly rebuilt at the same time, to facilitate the passage of the water from the Belleville aqueduct, but its general appearance was not altered. As for the fountain, it is not of any great value as a piece of architecture, being of course in the style prevalent at the date of its construction. The buildings now being pulled down also dated from the time of the inauguration of the public fountain of Vertbois, which fact indeed was very evident from their physiognomy. The old fountain, as stated above, is not to be demolished.

A LOAN exhibition of works of art on the plan of that held at Mechlin in 1864—with this difference, that paintings will not be excluded—is announced to be opened at Lille in what was until recently the Hôtel de la Préfecture du Nord in the Rue Royale. Many of the churches of the Département du Nord contain works of art but little known, while there is no part of France in which there are larger or finer private collections, most of the proprietors of which will contribute their choicest treasures. The exhibition will, it is said, only remain open for a month, as the building is about to be appropriated to other purposes.

THE municipality of Bruges have purchased, for 52,000 francs, the ancient Hotel de Gruuthuuse, which has for the last 250 years served as the public pawnshop of the town. This fine building, in which Edward IV. resided for some weeks in 1471, will, after the necessary repairs have been executed, be occupied in part by the public library; in part as a picture-gallery, in which will be brought together the paintings now at the Academy and at the Hôtel de Ville; and in part by the interesting archaeological collections now in the Belfry Tower of the Halles.

DURING recent repairs in the church of Notre Dame at Bruges, a fine distemper painting of the middle of the fourteenth century has been brought to light in the south ambulatory of the choir. It represents a full-length figure of St. Louis, the ground being occupied by oak leaves and acorns. Four finely-carved mural monuments of the end of the fifteenth and commencement of the sixteenth century have also been discovered. Unfortunately nearly all the figures have been decapitated, probably by the Calvinists in 1580; but the beauty of their polychromatic decoration render them, even in their mutilated state, objects of great interest.

THE STAGE.

La Belle Paule. Par Louis Denayrouze. (Paris: Librairie des Bibliophiles.)

THERE is not substance enough in *La Belle Paule*—the little one act comedy, or “fantaisie” in verse, produced a week or so ago at the Théâtre Français—for it to demand, for its own sake, serious notice; nor can it keep its place permanently on the French stage or in French literature, unless it is in due time supported by such other work of its author as shall cause him to be reckoned among the poets whose productions are not an accident, but a business of importance. But, at all events, *La Belle Paule* is extremely typical: it is slight, graceful, and finished. There are fifty somewhat cultivated young men in Paris who can do this sort of thing more or less well. Most of them are employed in offices, the work of which absorbs their prosaic moments; but now and again, when they have been reading De Musset or looking at Corot—admiring the green things of the spring, or a pathetic sunset, or somebody else's wife—there comes to them a transient gift of poetry. They are stirred a little, and they do not generally so far confuse this temporary sentiment or exaltation with an abiding inspiration, or a serious faculty of literary work, as to attempt great or laborious books, but forthwith deliver themselves with much delicate pains, so long as the gift is upon them, of verses which are read and praised to-day, and forgotten to-morrow. Or, the best of these remain a little longer in the memory: the Odéon, or the Théâtre Français, takes them: Delaunay, Bressant, Pierre Berton,

Sarah Bernhardt, interpret them, with fine taste and accomplished art. Of these things, *La Belle Paule* is perhaps a favourable specimen: a little more ingenious in construction than these things are wont to be: a little gayer: perhaps even a little more spontaneously tender; but, on the other hand, even slighter in its subject: a tiny gold lump, beaten very thin and carefully: a graceful tree, curiously barren.

“*La Belle Paule*” is an historical character. She was chosen to give to Francis the First the keys of her town of Toulouse. He bestowed upon her the flattering name by which she was thenceforth known. Catherine de Médicis, thirty years afterwards, went a long way round to see the famous beauty, and found the famous beauty still equal to her reputation. But that was in the autumn of her life. In its summer the townspeople had pressed upon her their admiration so much, that she declined to walk abroad; she could not do so without serious inconvenience, she said. The citizens differed from her. There was a turmoil round her doors, and the town council, judging it unreasonable the town should be deprived of the sight of her, ordered her husband to cause her to appear twice every week for an hour in the public promenade. She was more wondrous to behold, they said, than “the Church of Saint Sernin, or the Mill of Bazacle”—like these, she was a public monument, and must no more be hidden than these must be. There exists still a curious book, full of the praise of her, the work of a poor poet, who could not have his pleasure, and so was forced to write about it.

“*La Belle Paule*,” it appears, was a very good young woman, and this little comedy, by M. Denayrouze, is a story of a quite innocent affection. Gaston de Ligniville's attitude of mind towards Paule, Comtesse de Beynagnet, is like that of Zanetto towards Sylvie, in M. Coppée's really exquisite poem of *Le Passant*. But the two women, Sylvie and Paule, are very differently placed. Paule's indifference passes at last only into a mildly pitying endurance of the presence of the youth who is sick of love; but Sylvie, endowed with too many a sad experience, sends Zanetto away for his own sake, and to her bitter regret; and it is this that strikes a chord of profound and moving pathos in the work of M. Coppée. Gaston, attired as a waiting-maid, has gained access to the secluded Paule—it is before the time at which the town council of Toulouse makes its famous and wise decree—and Paule, discovering his stratagem, is properly enraged, and it needs all the efforts of Claude Cazalis, an authority in Toulouse, and all the efforts too of Paule's friend, Gaston's cousin, to persuade her that the youth is but a simple youth, and that he is like to die if she will hide her face from him. And he himself pleads eloquently:—

“Avez-vous pu me croire à ce point orgueilleux
De prétendre occuper un instant vos pensées?
L'ai-je donc essayé, dans ces heures passées
Naguère à vos côtés? Non, mon bonheur secret
N'était pas exigeant, n'était pas indiscret:
Était-il criminel? Je ne saurais le croire.
Il est des biens que Dieu laisse à tous ici-bas:
La fraîcheur de la source où l'on ne peut pas boire,
Le parfum de la fleur que l'on ne cueille pas.”

And now it strikes the husband, who is old and ugly (as a husband should be in sixteenth century romance), that his own appearance, as the escort of his wife, will be absurd. Odette, the waiting-maid, shall escort her, but dressed as a page. But Odette, the waiting-maid, is no other than Gaston, and it would fare ill with Gaston were the husband told of this. So Paule is merciful, and keeps him in ignorance, and the curtain falls on her gesture of consent that the boy shall be her cavalier, as she paces, twice a week, the promenade of Toulouse.

And so this thin thread of harmless intrigue is worked into the web, in all ways slight. It recalls a little the adventure of Cherubino with the Countess; but here, *bien entendu*, the secondary characters are not individualised. Where is even the shadow of the Barber?—where even the palest ghost of Suzanne? The secondary characters do but serve to work the light machinery of the piece. They are old stage friends, or rather friends so vague that we do not fully recognise them; but they deliver their smooth verses, and all goes well till the end. All goes well because so little is aimed at but elegance and grace, and these are reached indeed, with here and there a pleasant railery to boot—Rabelais' frank mockery, weakened and restrained, one may say—and once and again the elegance becomes beauty, and the grace sympathetic and touching. We have quoted the second best thing in the work of M. Denayrouze: let us quote the best, and finish. It is a simile, and the speech is Gaston's:—

“Mon humble amour n'a pu beaucoup vous irriter,
Son hommage en effet n'eût pas osé monter,
Sans l'aide du hasard, jusqu'à la femme aimée.
Ainsi lorsque l'on suit du regard la fumée
Qui flotte, aux jours de fête, au-dessus de l'autel,
On la voit s'arrêter à mi-chemin du ciel:
L'offrande ne va pas si haut que la prière:
L'une se perd, tandis qu'invisible et légère
L'autre atteint—seule, hélas!—l'inaccessible azur.”

There are shorter plays and plays by unknown men, that have struck deeper than this butterfly comedy. But we will not quarrel with it, or call it absolutely worthless. We will not read it often, but we will read it once—on a garden-seat, some empty day—and then it may be slipped indulgently between the leaves of the lightest work of De Musset.

It is better, however, to see it acted, as it is now acted at the Théâtre Français, where, in the part of the stripling who is taken with the love of the noble dame, Mdlle. Sarah Bernhardt has repeated her success of Zanetto in *Le Passant*—has continued, that is to say, the sort of success with which until very lately her name has been chiefly associated. Her newly-acquired range we spoke about in writing of *Le Sphinx*; and here it is not necessary to give more than a line or so to chronicle that appreciation by the artistic public—already excellently expressed by an eminent dramatic critic, M. Francisque Sarcey—of Mdlle. Bernhardt's impressive recitation. The most poetical lines, which we have quoted, are “sung” by her, as another critic has said, with a “chaude monotonie,” of which she possesses the secret; and it is this secret which at her best moments holds an overflowing audience

in entire quietness from roof to floor. The acting itself has no monotony, for here monotony would be wholly out of place. It is full of modest wistfulness, relieved by a graceful stripling's gaiety. If Mdlle. Bernhardt played in English, she would be an excellent Imogen and an excellent Viola. The part of the "Belle Paule" is well enough sustained by Mdlle. Lloyd, as far as looks are concerned; and with this part it is evident that looks have much to do. The conception, too, of the character of the somewhat haughty and cool beauty is probably accurate, but greater delicacy and finish of execution—subtler expression, more impressive gesture—are undoubtedly to be desired. There is much humour in M. Thiron's representation of the old citizen who was determined that "La belle Paule" should walk abroad for all Toulouse to look at her. M. Martel's performance of Beynaguet is careful, of course—because it is at the Français—but many of those who see it feel that he has hardly seized the true type, and that the play suffers from his presenting us with another, however good that other may be.

FREDERICK WEDMORE.

MONSIEUR GOT IN "MERCADET," AND MR. IRVING IN "CHARLES THE FIRST."

Mercadet, le Faiseur, known to the English public through Mr. Charles Mathews's performance in *A Game of Speculation*, is as much Balzac's work in virtue of what it lacks as in virtue of what it contains. The only comedy of the great novelist which has succeeded in keeping its place upon the stage—the only piece indeed, save the drama of *La Marâtre*—it throws some light upon the question of the failure of the others: one sees in it what were the conditions Balzac recognised as necessary in work for the theatre, and what also were the generally necessary conditions which he ignored. In *Mercadet*, his one successful comedy, he ignored some common conditions even more completely than anywhere else; but he did it this once with impunity, and triumphed by an accident, or triumphed perhaps because in this comedy of *Mercadet* he made so exceptional and masterly a use of his own special qualities, that the absence of qualities generally necessary was for once overlooked. He did not seem to believe that for dramatic success you must have dramatic situations—he thought that with intellectual food of his own high kind, you could dispense altogether with the stimulus of emotion. And in *Mercadet* he was successful in dispensing with it. Besides, in *Mercadet* he did contrive dramatic situations for the hero upon whom he concentrated his force; or, at all events, these were contrived by the person who re-arranged the work for actual performance. Yet the interest is wholly in the analysis of character. You do not care about the man's fortunes, but about the recesses of his mind. And that is not commonly found to be the kind of interest which makes a modern theatrical success.

Not indeed that the work is altogether without the charm of imagination. Money was the great thing to excite the imagination of Balzac, especially in his last years—years only of middle-age—when he wrote *Mercadet*. An immense fortune rapidly acquired—the promised land of dabblers in finance—that is the one thing Balzac never possessed, and it had for him the charm of the unknown. In *Mercadet*, as in *Eugénie Grandet*, he lived in an atmosphere of millions: he revelled in the discussion of untold treasures. He delighted in much manoeuvring of money. You see that again and again in his work: in *Mercadet*, in *Eugénie Grandet*, in *Un Ménage de Garçon*, in *César Birotteau*.

And because he delighted in much manoeuvring of money he thought that he could make a comedy

out of the study of one man who manoeuvred money and those who were the possessors of money. And, as a *tour de force*, he succeeded. You do follow Mercadet in his schemes, his projects, his counter-projects, with an interest which comes very near to desire for his success; and in the infinity of resource which this one speculator exhibits there is opportunity, which Balzac of course seizes, for the display of many phases of his character; and there is opportunity too for the assembling round him of a group of more or less ingenious dupes as life-like as himself and as selfish, and above which he towers supreme in virtue of his easy subtlety. The subtlety is so complete that it imposes, or may well impose, upon those who see the comedy as well as upon those who take part in it. Of most stage-characters we can readily guess what will be their action in given circumstances. And of Mercadet we feel very sure that he will find some way out of every embarrassment that want of money may cause. That subtlety is made to succeed; and we watch, not *what* will happen, but *how* it will happen. But when Mercadet is at last successful—placed now, through the return of the once truant partner, beyond the danger of pressing creditors and threatening shareholders—and therefore easy not so much now in the possession of his ability as in the fact that there is no longer any crying need to employ it, then it is a matter of absolute uncertainty and curiosity to us how far he will keep his promise, made in days of adversity, to let his daughter marry the poor lover of her choice, who had offered all his little possessions and would have renounced everything for her. It is a matter of life-like uncertainty, I say, as to what will happen; but when the thing is decided—and decided so easily and fluently by Mercadet, as if there never could have been a question about it—then we feel half-ashamed of ourselves for having entertained a doubt. The decision is so absolutely natural, so absolutely true—and we, we have been blinded by the constant vision of stage rogues who are thorough-going, and of parents who never relent. Balzac knew better. This Mercadet would have sacrificed anything—even his daughter's happiness (nay, in his intention he had actually done so)—to the acquisition of a fortune. But, a fortune once in possession, why should he sacrifice his daughter's happiness to the acquisition of a second which he did not want? His daughter should, of course, have married the first rich man attainable, rather than that *he* should have been poor; but, once rich, she should marry the poor man of her choice; and she should be happy and he would be magnanimous. So having in truth a little good feeling, *he poses* to have a good deal; and we leave him as his child and her lover as blessing him for an amount of self-sacrifice he never intended, and as his shareholders are lauding him for a restitution it became convenient to make.

This is but a rough outline of one of the subtlest characters in all dramatic fiction. The part is full of words, sentences, ejaculations, each one of which is well nigh the revelation of the whole, as the skeleton may be known by its single bone. Mercadet does an honourable thing which was not precisely necessary. "C'était un bon mouvement," he says, rather happily; and then, at once, regretfully, "J'ai eu tort de le faire!" That is the phrase of a man who is human in spite of himself; who has wriggled, schemed and deceived so much, that he has come to think deception a virtue: all moral sense is undermined in him—he may yet do good upon impulse, but he can never do it upon principle.

The easy subtlety which is the foundation of the part; the absence of moral sense, or rather its entire decay; the presence of a self-satisfied temperament, fairly happy with this world as it is; a mind regarding the possession of a fortune as the one necessary thing in life, and the possession of a child's love as a very pretty and pleasant little luxury, *par dessus le marché*—all

this Monsieur Got seizes and interprets with a most consummate art. I do not think the performance a very striking one. All the details are worked into one harmonious whole, so that you do not notice very specially the perfection of any one. Like the best music-making, like the best designing, it is done so easily that it must be easy to do. And I suppose it is because of its entire and perfect harmony that it commends itself even more to French critics, who look at an *ensemble*, than to English audiences which search for details. And yet the English audience of Monday evening at the Princess's—a picked one, of course, and very different from that which troops together, sheep-like, to the semi-fashionable theatres—was an audience it must upon the whole have been satisfactory to satisfy. And M. Got did satisfy it from beginning to end, with his glib readiness, his inexhaustible resource, and his facial expression constantly changing, and in its changes often purposely concealing instead of revealing the thoughts that are passing through the speculator's mind. What a pleasure the man takes in his own mental agility!—Mercadet would hardly, until the end, when he wants rest, banish the difficulties the struggle with which (if anything so easy can be called a struggle) is his great *raison d'être*. And this activity, which is not restlessness, but only the result of the consciousness of his capacity, M. Got renders with untiring effort—that never seems to be effort at all. I have said, it is not a performance that moves: perhaps even, it may not strike you. But your appreciation of the theatre must be a narrow one if you do not recognise that here the value of the performance is in its truth—not in its momentary impressiveness. M. Got's predecessor brought out the lighter side of the character. M. Got is a more serious student; yet he is always a comedian. There is no passion in his performance: hardly any tenderness: no impulse: all calculated effect. It is not stimulating like wine, but as cool as flowing water. Very possibly it is not genius at all; it is without great moments and happy inspirations. But in its union of depth and ease it is *le dernier mot de l'art*.

Charles the First was revived on Monday at the Lyceum Theatre, and was received with great applause, which upon the whole it deserved. It is true that it wants continuity of interest—that it is a poetical chronicle, lacking strong dramatic situations—that the first act is tedious because nothing whatever happens in it, and the last tedious because we know only too well that which will happen at the end. And yet the first act is graceful, and the last is pathetic, and between them there are two which show more than these show the clash of effort, the cross purposes, the intrigue, the resource, necessary to almost all that is large in dramatic work. The language is chosen, and the poetry is often poetry in substance as well as in form. Indeed, the literary labour bestowed upon the piece is that of a scholar and artist in literature. There are many passages that would stand well the test of being read in the study, and these are damaged rather than bettered by their association with the footlights; though, of course, when it is Mr. Irving who recites them they gain as much as they lose. That there is inequality in the dialogue is not to be denied, and when Mr. Wills's muse deserts him he once or twice has recourse to rather commonplace English of our day, and not to that "cavalier-slang" which Coleridge found in South, though not in Barrow. Also, his work lacks the local colour of Mr. Browning's Cavalier Tunes. It is at once a praise and a blame to say that his poetry is not poetry of the period—it has beauties which are independent and lasting.

The piece gains greatly, in the present revival, by Mr. Clayton's performance of Cromwell. Not but that Mr. Belmore, who used to play the part, is a clever actor: only his Cromwell happened to be a clever actor's mistake. Mr. Wills himself has gone far enough from Carlyle to be able to dispense

with the assistance of his interpreter's progress in the same direction. Mr. Belmore gave us a striking stage figure, accentuating one side of Mr. Wills's picture, and thus exaggerating or distorting it. Mr. Clayton gives earnestness and reality to what there is of humane in Mr. Wills's picture, and thus, though no acting can get over the difficulty presented in the second act of the play (where Cromwell, despite his protestations, is too obviously venal), he does upon the whole suggest an impression which is probably not much less true than history is. A slighter change in the representation is a disadvantage rather than an advantage. Ireton now interrupts the king so civilly—at all events so seriously and earnestly—that there remains no force in the king's surprised enquiry, "Who is this rude gentleman?"

Mr. Irving's performance of Charles the First, though always picturesque and often forcible, is not the finest of his parts. It is free from the grave fault of exaggeration which is seen amidst all the merits of Richelieu and Mathias; the performance is not, and cannot be, in so high a key as these, and there are times when this is a gain. On the other hand, there are fewer moments than in the performance of Richelieu and Mathias at which you feel yourself in the presence of an actor *hors ligne*—an artist whose work is not so much a profession as a vocation. Yet of course, as Charles the First, Mr. Irving does many things that are worth remembering—is happily passionate and finely scornful and apparently self-abandoned a moment after he has shown the inequality of his art by seeming a little stagey, or shown its insufficiency by habits of gesture and movement perhaps too often repeated; by want of variety, in fine, in little things—we know well enough that he can be varied in great ones. Notice the recital of the ballad of "King Lear" for attitude, expression, and intonation subtly true; and notice the fine dignity with which in the second act, as he stands with his back to the chimney piece in the White-hall cabinet, he ignores the presence of Cromwell. The King has suffered enough, and has told Cromwell that their interview has ended; and, though Cromwell does not withdraw, it is the same thing to the monarch, whose thoughts are now on other matters, and who has quite done with the task which he had set himself. In the third act, the whole bearing of Charles to Moray is fine and genuine: best of all is the reserve and high tranquillity maintained while he is speaking his last words to the traitor who has owed him much, and speaking them with a sober pity, scarcely conscious that it is also contempt. And in the fourth act, where, as elsewhere, the romantic and chivalrous attention to his wife is beset somewhat too much with circumstance to be as impressive as it is probably true, there is impressiveness as well as truth in every phrase and action addressed to his children, and it is seen how, with words which they believe to be only for their encouragement, it is really himself that he is nerving and fortifying.

And if Mr. Irving is not, as has been above implied, completely master of the whole wide language of gesture—though master indeed of some of its best eloquence—Miss Isabel Bateman is at a much earlier stage: she is like a traveller with sufficient entrance into a tongue to express the common wants, but failing just where the thing to be expressed is a thing of higher interest. Moments of quiet pathos don't always need to be illustrated by gesture at all; and that is why the quiet pathos of the last scene with the children is the best thing Miss Bateman does. Here her voice and facial expression, and the genuine feeling which one believes to be unconsciously aiding them, stand her in good stead. In stronger moments, which are meant to be more charged with excitement, even the voice goes wrong. Rushing into the presence of her lord, when Cromwell is threatening him, she shouts her signal, "God save the King!" not as if the troops she is summoning

were in a neighbouring chamber, but as if at the very least they were on the other side of the Mall. And while thus shouting, she brandishes her arm as if it held a sword, and as if, instead of being the Queen, calling upon followers whose presence is known and whose force is almost superfluous, she were Joan of Arc or Bertrand du Guesclin leading a forlorn hope. And this too is done with a self-consciousness of stage-effect, which in her pathetic passages Miss Bateman is fortunate enough to wholly lose. The actress is young, and has often to cope with parts which would tax severely an artist of a dozen years' practice. The intelligence she shows in everyday scenes—notably in *Philip*—and the sincerity of her pathos in *Charles the First*, allow one to believe that success in the stronger moments of *drame* may one day be within her reach. But, if one is to speak with the frankness without which criticism is valueless, that day has not yet arrived.

FREDERICK WEDMORE.

THE stage-work now presented at the Princess's Theatre is chiefly stage-work of a good many years ago, thanks to the watchful care with which the Lord Chamberlain's department guards us from most of the artistic literature of the day. Mme. Pasca appeared in *La Fiammina* on Thursday night; too late to allow of a long notice appearing in these columns. Mme. Pasca comes to us with some reputation made in Paris, and a greater one made in St. Petersburg. The actress, as we may possibly have occasion to point out in greater detail, is an artist of certain definite good qualities which happen to be well nigh as rare on the French as on the English stage. These have helped her in her career, and have even enabled her to dispense—not of course without great disadvantage—with other qualities which are possessed to the full by the three actresses just now in popular esteem at the head of the profession in Paris. Mme. Pasca took to the stage when she was no longer a girl. To some extent her experience of society made up for her lack of early and regular training. It did not do so altogether. Yet the training itself, which she did get, is by no means to be despised, for it was first given her by Delsarte—an old man of genius and of eccentricity—and then by her manager, at the Gymnase, M. Montigny, a man of immense experience, and of infinite pains.

ONE or two of the smaller theatrical events of Whitsuntide we did not notice last week. At the Vaudeville Theatre, Mr. Burnand has furnished a burlesque called *Here's Another Guy Mannerling!*—a title mildly indicative of animal spirits, which, indeed, are not wholly wanting to the performance in which Messrs. James and Thorne, and the Misses Kate Bishop, Marie Rhodes, Lizzie Russell, N. Walters, and Richards take part. A detachment of the Gaiety company, reinforced by Mlle. Cornélie d'Anka, plays, at the Globe Theatre, *La Fille de Madame Angot*, the popular airs of which are now whistled, more or less badly, by every errand-boy in every street in Europe. And after this test the music remains attractive.

At the Strand Theatre, they play *Nemesis* again, —a bright piece, done as brightly as ever.

M. REGNIER, who, until rather lately, was the leader of the Comédie Française, from which, in the height of his talent, he withdrew, now directs the rehearsals of the company—a task for which his judgment and fine taste eminently fit him.

OWING to pressure on our space, we defer our notes of the theatrical events of the last few days in Paris.

THE Berlin theatrical critics speak with enthusiasm of the marvellous histrionic power that they say has been manifested by an Italian gentleman, named Gaetano Campo, for some years a resident at Berlin. Signor Campo began life as a clerk in the Finance Office of Naples. Weary of the monotony of desk work, young Campo left Naples, and took up the profession of a violin

player at concerts, visiting in the course of his musical campaign various capitals of Europe, until at length he found himself a few years since at Berlin. There, in consequence of an injury to one of his fingers, he was forced to adopt the teaching of languages as a means of living. From this occupation he was rescued by the discovery of his great dramatic power, for which discovery he was indebted to the quick appreciation of the Berlin actress Frau Waller. At the suggestion of this lady he devoted himself to the study of the art, and so complete has been his success that the Shakespeare representations, which he has given at Berlin during the last winter, without decorations or other adjuncts, and entirely by himself, have elicited warm commendations from all who have been admitted to them, and we read that the opinion seems general among the theatrical connoisseurs of Berlin, that Signor Campo is destined to take his place as one of the best actors of our day.

MUSIC.

SIGNOR RANDEGGER's dramatic cantata *Fridolin*, composed for last year's Birmingham Musical Festival, was performed at the Crystal Palace Summer Concert on Saturday last. The subject of the cantata is taken from Schiller's poem "Der Gang nach dem Eisenhammer," and the libretto has been compiled with great skill by Madame Rudersdorff. The music is written with thorough knowledge of dramatic effect, and complete mastery both of vocal and instrumental resources; and the applause with which each number was received, as well as the sustained interest in a work lasting somewhat over two hours in performance, bore well-merited tribute to its excellence. The bright and sparkling hunting-chorus was encored; and an attempt was made to obtain a repetition of some of the other numbers, to which the composer, who conducted the performance of his own work, wisely declined to accede. The principal parts were sustained by Madame Lemmens-Sherrington, Messrs. Cummings and Santley, and Signor Foli—the same singers who took part in the work at its first performance. The choruses were exceedingly well sung by the members of the St. Thomas's Choral Society and the Brixton Choral Society, and Signor Randegger showed himself no less experienced as a conductor than as a composer. It would be untrue to say that *Fridolin* shows the highest order of original genius; but it is a work displaying indisputable talent, and of sufficient attractiveness to render it probable that it will keep its place in our concert programmes.

THE last Philharmonic Concert, on Monday evening, differed from several of those which have preceded it, in bringing forward no special novelty either as regards performers or music. A mere record of the programme will therefore suffice. The symphonies were Haydn's "Surprise," and Beethoven in C minor. Mr. Macfarren's overture to *St. John the Baptist* was also given. Mr. Alfred Jaell, to whose excellent pianoforte playing London concert-goers are no strangers, brought forward Beethoven's first concerto (in C major), and Schumann's Concert-Stück for piano and orchestra; and Miss Blanche Cole and Mr. Edward Lloyd were the vocalists.

THE number of concerts, now that the season is at its height, increases so rapidly—our "engagement" list for this week giving no less than four for to-day—that anything like keeping pace with them is simply impossible. For this reason we must mention more briefly than it deserves Mlle. Krebs's first piano Recital, which took place last Thursday week at St. James's Hall. We spoke of this young lady recently on her appearance at the Philharmonic concert. On the occasion of her recital she showed herself alike a mistress of all styles. Her rendering of the opening piece—Beethoven's Sonata, commonly called "Appassionata"—was equally perfect from a mechanical

and intellectual point of view, while, in a totally different style, her performance of Rubinstein's "Etude Infernale" (of which the composer is reported to have said, "I did not write it for any artist but myself; nor do I think that any one will ever attempt to play it") was a wonderful display of *bravura* playing. The composers whose names were included in the programme were Beethoven, Schumann, Bach, Rameau, F. Hiller, Scarlatti, Chopin, H. Seeling, Weber, Liszt, and Rubinstein. The applause after each number was most enthusiastic. Mlle. Krebs's second Recital takes place next Thursday afternoon, when the programme will be fully equal to the previous one.

M. ALPHONSE DUVERNOY gave the first of two piano recitals at the Hanover Square Rooms yesterday week. As we were unable to attend, we must content ourselves with saying that the programme comprised selections from Mozart, Mendelssohn, Scarlatti, Beethoven, Duvernoy, Weber, Schubert, Chopin and Liszt.

FOLLOWING upon the recent appearance of the Swedish Ladies' Quartet, we have now to record the first performance in London of "The Scandinavian Vocalists"—eight ladies from St. Petersburg—which took place at St. James's Hall last Saturday. Their admirably finished part-singing in various national melodies, Russian, Swedish, and Danish, as well as a vocal arrangement of two of Strauss's waltzes, was worthy of all praise; and there can be little doubt that as their performances become better known they will be exceedingly popular.

THE concerts which Anton Rubinstein gave last month in St. Petersburg and Moscow—two in each city—yielded the enormous sum of 23,000 roubles silver. One of each of the two concerts was for a charitable object.

HENRI HERZ, whose health has for some time been failing, has resigned his professorship at the Paris Conservatoire, which he has held since the year 1842, and Madame Massart has been appointed his successor.

M. ARBAN, the celebrated performer on the cornet-à-piston, has also resigned his professorship in the same Conservatoire, in consequence of his being refused leave of absence for a journey to St. Petersburg. M. Maury is named as likely to succeed him.

AN interesting contest for precedence is attached to the recent performance of Verdi's new opera *Aida* at Vienna, which has only been made public since the performance. After the wearisome negotiations with the publisher of Verdi's operas (Ricordi, of Milan), which he prolonged to the utmost, had been concluded, the Italian came to the directors of the Opera with a new condition. He required that they should sign an undertaking not to bring out *Aida* till after its first performance at Berlin. Herr Herbeck, the conductor of the Opera, declared that sooner than agree to such a condition he would decline altogether to produce the work. The publisher, Ricordi, was in no small perplexity; for he had already concluded an agreement with Berlin, giving the Opera of that city the priority of performance of the opera, and resigning all right to payment if the work were produced first at Vienna. But as he also wished not to lose his "tantièmes" at Vienna, he signed the agreement with the Opera of that city also, and trusted to his craft to get him out of his dilemma. The means he adopted were very simple. While he had in January already sent the score of the opera to Berlin, he deferred sending one to Vienna till the end of February. Herbeck was highly indignant, and, being resolved if possible to punish the publisher, made every exertion to produce the opera at Vienna before its performance could take place at Berlin. Unfortunately for him, however, two of the principal singers, Frau Wilt and Herr Müller, fell ill, and the opera was after all produced in

Vienna just two days after the first performance had taken place in Berlin.

It is announced that a school of music is to be established by order of the Imperial German Government at Düsseldorf in connexion with the local school of painting.

THE programme of the musical festival to be held at Munich in August has already been published. Among other pieces by native composers, a motett by Orlando Lasso, and the *Macte Imperator* of Franz Lachner will be given. Handel will be represented by the "Bacchus Chorus" in *Alexander's Feast*; Beethoven, by a piece from *King Stephen*; Mozart, by the song "O Isis and Osiris;" and Mendelssohn, by a chorus from the *Antigone*.

THIS year's musical festival at Cologne is reported to have been the most brilliant on record among the fifty-one celebrations which it has already held. On the first evening, May 24, Handel's *Samson Agonistes* was given with unparalleled success both in the solo and choral parts. The King of the Belgians has presented the Cross of the Leopold order, with an expression of his admiration, to the talented director, Ferdinand Hiller, while a laurel wreath was proffered to Johan Brahms, at the close of the first evening's performance, in the name of the entire company, by one of the ladies who had taken part in the choruses. The festival concluded, on the evening of May 26, with Hiller's *Destruction of Jerusalem*, and selections from Mendelssohn, Schumann, and Brahms, and so unanimous are the musical critics of Cologne in their commendation of the admirable finish and perfection with which the several performers acquitted themselves, that it seems almost invidious to single out Herr Joseph Joachim and his wife as having earned an exceptional tribute of admiration.

It was for a long time unknown where the remains of the celebrated composer, Donizetti, were buried, but his tomb has recently been discovered at Bergamo, in Italy, and the remains were deposited, in the presence of the Municipal Council of Bergamo, in a bronze sarcophagus in the church of Ste. Marie Majeure, Bergamo.

A CURIOUS discovery has just been made in Italy by M. Avrigotti, a young musician, who has arrived in Paris with his prize. It is an unpublished score by Cimarosa, entitled *Margherita di Vicenza*. It was in a Carmelite convent at Florence that the finder hit on it one day in turning over some old papers. He obtained the manuscript without any difficulty, and has presented it to the Paris Conservatoire, where he is pursuing his studies.

POSTSCRIPT.

DR. MAX JORDAN, whose name is well-known in art literature, has been made Director of the Berlin National Gallery. For many years Dr. Jordan has occupied the position of Director of the Museum of Leipzig, and has taught in the University of that city.

A NEW Salle has just been opened in the Louvre for ancient American curiosities. In the glass cases that line the walls is placed a considerable collection of pottery, idols, vases, and other objects, which gives a good idea of the artistic knowledge of the races that inhabited America before its discovery by Columbus. Many of the idols are carved in stone and marble, and resemble in their types the well-known Egyptian divinities. The most remarkable object of the collection is an immense zodiac of about twelve metres in circumference, cut in a kind of black marble, and absolutely covered with grotesque signs and inscriptions. All these treasures, it appears, have been for a long time stowed away in the magazines of the Louvre, but until the recent stir about the management of that museum no one seems to have thought of exhibiting them.

WE are glad to find that the proposal for the rebuilding of Heidelberg Castle is discounted by Herr Baurath Essenwein. In the *Anzeiger für Kunde der deutschen Vorzeit* he says, "If modern wants, and modern modes of living are different from what they were in olden times, then build modern castles as many as are needed; build one even in Heidelberg if necessary, but leave the historical and artistic parts of Heidelberg Castle alone, or limit all work upon them to their preservation." Restoration even in Heidelberg Castle would take away a great part of its charm, a charm that depends so much upon its picturesque decay, for the building itself has not much architectural beauty.

THE great work on Michael Angelo, which is promised for his fourth centenary, in March, 1875, and which, it is said, will contain 700 letters of the great artist, besides more than 1,000 letters and writings of various kinds by his contemporaries, will be published, we hear, simultaneously in three languages—Italian, German, and French. Why not in English?

VICTOR HUGO, it seems, is exiled in France even from the domains of art. M. Garnier, an artist of too much talent to be overlooked, sent to the Salon a picture representing a scene from *Le Roi s'amuse*. The jury somewhat reluctantly accepted it, but orders from Government were sent to the hanging committee to hang this little picture, which is of cabinet size, as high as possible. M. Garnier protested in vain. His picture of "Le père des lettres" smiling amiably on two ladies of his court remains where it cannot possibly be seen by the naked eye. "Pas de roi qui s'amuse—au Salon!" says a French critic.

THE decorative works in the interior of the Palais de la Légion d'Honneur (one of M. de Chennevière's projects) have been confided as follows: the great cupola to M. Maillot, the small cupola to M. Jules Laurens, the Salon des Muses to M. Ehrman, the salle-à-manger to M. Bin, the Salon de l'Aurore to M. Rasnier, and the paintings on the doors to a lady, M^{me}. Escalier.

THE *Allgemeines Künstler-Lexicon* has positively in its eighteenth number reached the letter B! It has taken four years to do so, and has apparently so exhausted its editor, Dr. Wilhelm Schmidt, that at B he gives up his task in despair to Herr Hermann Lücke.

SATURDAY, JUNE 13, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Bothwell: a Tragedy. By Algernon Charles Swinburne. (London: Chatto & Windus, 1874.)

ALL true lovers of English poetry will, we think, join with us in congratulating Mr. Swinburne upon his return to the regions of pure art, after the various excursions into the debatable land of poetical politics and theology which have diversified his literary course since 1866. In making this congratulation, we would be understood as not in any way intending to disparage the value of his productions in the interval. They include some of their author's most elaborate work, and stand conspicuous even among that work for combined audacity and success. But still such pieces as the *Ode on the French Revolution*, and not a few of the *Songs before Sunrise*, come near to be thought poetical *tours de force*, and poetical *tours de force* are not in themselves lovely or admirable. That these pieces are as good as they are, is owing to the fact that Mr. Swinburne can, as Stella said of Swift, "write beautifully about a broomstick." It is good that broomsticks should be written about beautifully, if they are to be written about at all; and it is good that we should have a writer capable of writing beautifully about them. But this fact being once well ascertained and established, it is to be desired that the best writer should set himself to work on the best subject, and that he should leave to lesser men the task of conciliating the cant of criticism by treating subjects which are too near to be properly seen, too disturbing to be dispassionately treated, and of too complex and irritating a nature to be adequately appreciated and judged.

From all these drawbacks the subject of *Bothwell* is completely free. It is far enough off from us in point of time and circumstance, to stand in no danger of confused and indistinct vision; it depends for its interest on certain few and eternal aspects of human passion and character which are ever clearly present to us, and are independent of the passing influence of circumstance and fashion; and although it possesses the subdued piquancy of a debated historical incident, it is not likely that any modern Sir Arthur Wardour, unless he be even less rational than his prototype, will quarrel with Mr. Swinburne for the view he has taken of Queen Mary's guilt. The subject, moreover, in our author's hands possesses an interest which it would have in those of no other man. It is his because he has proved it. Notwithstanding the perhaps more legitimately poetical attractions of the *Poems and Ballads*, we have always considered *Chastelard* as Mr. Swinburne's greatest work. In this latter he added to a mastery of poetical treatment as great, if less varied than that shown in the later publication, a power of creating and inter-

preting character, the equal of which we must go back some centuries for any hope of finding. There must be many of our readers who remember the peculiar sensation of discovering that in this our prosaic and uncreative age there had been born to us a poet who could not only melodiously describe and interpret, but also actually fashion and make. The Queen Mary of *Chastelard* was the, we had almost said, living proof of such a manifestation; and when, some year or two after the appearance of the earlier poem, *Bothwell* was announced as in preparation, the only fear which could have occurred to any lover of poetry was lest overhaste and the proverbial fatality of second parts might mar or obscure the excellence of the original creation. It is not too soon to say that, by the appearance of *Bothwell*, any such fear has been completely and triumphantly dispelled.

Of the general plot or fable of the play it cannot be necessary to say very much. The first act deals with the murder of Rizzio, the second with that of Darnley, the third and fourth with the matters attending Mary's ill-starred wedlock with Bothwell, the fifth with Lochleven and Langside, until the play closes on the shore of Solway. In all this the poet has closely followed history, or perhaps we may say, in order to conciliate the possible Sir Arthur Wardours, the generally accepted view of history; and he has throughout shown evidence of a close and minute study of the original records. Some few words it may be well to say of his attitude as to the main historical question of the Queen's innocence or guilt. She is inferred or assumed to be guilty. It would perhaps be sufficient to say that such inference or assumption is clearly within the poet's province. It is not his business to discuss the genuineness of the Casket letters, or in any other way to meddle with Mr. Carlyle's "Mother of dead dogs." But there is a far more sufficient justification. Mary innocent may be comforting to the moralist, and possible to the historian: to the artist she would be a discomfort and an impossibility. The possession of Mr. Swinburne's Mary is a far greater gain to the aesthetic sense than any certainty of her innocence could be to the moral feelings.

It is a point of far higher importance and of much greater interest to examine the superstructure of character which the author, in the discharge of his office of dramatic poet, has built upon the foundation of plot contributed by history. It is one thing to construct or borrow a certain combination of circumstances and action; it is another and an infinitely more difficult thing so to set in motion the persons in the drama that such action and circumstance shall occur in a natural sequence and evolution. The keynote of Mr. Swinburne's general treatment of his theme is struck not uncertainly by a quotation from the *Choephoree* which serves as motto, and still more clearly by the following sonnet dedicatory:—

À VICTOR HUGO.

"Comme un fleuve qui donne à l'océan son âme,
J'apporte au lieu sacré d'où le vers tonne et luit
Mon drame épique et plein de tumulte et de flamme,
Où vibre un siècle éteint, où flotte un jour qui fuit.

Un peuple qui rugit sous les pieds d'une femme
Passe, et son souffle emplit d'aube et d'ombre et de bruit
Un ciel âpre et guerrier qui luit comme une lame
Sur l'avenir debout, sur le passé détruit.
Au fond des cieux hagards, par l'orage battue,
Une figure d'ombre et d'étoiles vêtue
Pleure et menace et brille en s'ébranouissant;
Éclair d'amour qui blesse et de haine qui tue,
Fleur éclose au sommet du siècle éblouissant,
Rose à tige épineuse et que rougit le sang."

The promise of this melodious overture is well kept. Act by act and scene by scene the poet has developed with steady and patient art the varied and turbulent passion of his sombre subject. In the outer circle are the tumultuous and half-savage commons, with their recent barbarism as yet but half transformed by the sour and ignoble fanaticism which culminated in the disgraces of Newcastle and Dunbar, and almost justified the sharp medicine of boot and gallows which Mary's great grandsons had to apply. Among these, and, to some extent, of them, appear divines like Knox and Craig, already meditating their arrogant theocracy, and with mouths full of the mystic and terrible language of the Hebrew Bible. Then come the barons greater and less, the abler among them showing the peculiar and rather hideous sixteenth century mixture of savagery and civilisation, with some devotion to religion, a good deal to Scotland, and an infinite amount to themselves, utterly careless of human blood, and yet careful to observe certain forms and conventions in shedding it. Surrounded by these, and attended by a few more prominent characters, stands the central figure of the Queen. By the time we have turned a score or two of pages, we see that Mr. Swinburne's hand has not lost its cunning. The Mary of *Chastelard* stands again before us, or rather that Mary with the due changes that time and chance, and light love and blood-guiltiness have wrought. In the former play she was still the lion's whelp, ἐν βιότῳ προτελείῳς ἄμερος, and had the freshness of her joyous life in France yet upon her. Now she has hardened and grown fiercer. At almost her first appearance she speaks to Rizzio of her subjects thus:—

"These starved slaves
That feed on frost and suck the snows for drink,
Hating the light for the heat's sake, love the cold:
We want some hotter fire than summer or sun
To burn their dead blood through and change their veins."

and in her first conversation with Bothwell she hints and glances at Darnley's death. The murder of Rizzio fixes these loose and casual impulses towards freedom and revenge, and determines her upon the death of her husband, the punishment of his accomplices, and the vindication of her own authority.

"I would have all their heads here in my lap," she says to Mary Beaton, and this unconquerable spirit of independence and revenge never leaves her in good or evil fortune, in Holyrood or Lochleven, at Carberry or Langside. It even acquires strength and width of view as her misfortunes thicken, and from a mere ebullition of wounded personal pride becomes a sympathetic consciousness that in her the battle of sovereign and people is for the first, but not the last

time being fought out. As her foot leaves Scottish soil, she says :—

"If I live,
If God pluck not all hope out of my hand,
If aught of all mine prosper, I that go
Shall come back to men's ruin as a flame
The wind bears down, that grows against the wind
And grasps it with great hands and wins its way
And wins its will and triumphs : so shall I
Let loose the fire of all my heart, to feed
On these that would have quenched it. . . .

I will leave
No living soul of their blaspheming faith
Who war with monarchs ; God shall see me reign
As he shall reign beside me, and his foes
Lie at my foot with mine ; kingdoms and kings
Shall from my heart take spirit, and at my soul
Their souls be kindled to devour for prey
The people that would make its prey of them,
And leave God's altar stripped of sacrament
As all king's heads of sovereignty, and make
Bare as their thrones his temples."

The whole course of the play is but the means whereby this white heat of passion is gradually forged ; and so skilful is the accumulation of insult and disappointment, so cunning the fashion in which the web of calamity is woven round the Queen, that no reader can possibly avoid or refuse that sympathy which is the inevitable reward of true and well-calculated tragic action.

But besides this mood of "fire and iron," the poet has also shown us another aspect of Mary's character. Coincident with the *haine qui tue*, and strangely intermingled with it, there is the hardly less fatal *amour qui blesse*. Mr. Swinburne has wisely limited the display of this love on Mary's part to Bothwell alone ; giving no countenance to the supposition of anything more than injudicious favour towards Rizzio. Here also the texture and quality of the Queen's passion is, as it should be, altered since the times when it lured Chastelard open-eyed to destruction. Then, though she could say in a moment of intoxication,

"I am sure I shall not love man twice,"

yet in cooler blood she had to confess the truth :—

"I would to God
You loved me less ; I give you all I can
For all this love of yours, and yet I am sure
I shall live out the sorrow of your death
And be glad afterwards."

(*Chastelard*, act iii. sc. 1.)

But this light love, which then scarcely understood anything but mere pastime, has now grown less playful if not less deadly. It is reduced gradually to a condition wherein it hardly differs, save in intensity, from the love of those meaner women whom Mary despises so much. No finer or more dramatic retribution could possibly have been devised than this. The light fancy which could give neither pity nor constancy, which hardly knew what to do with such a passion as Chastelard's, fixes itself at last upon an unworthy and commonplace nature, and, hardly experiencing return, becomes a patient wife-like devotion under insult and neglect, worthy of Griselda herself. The touches which mark this change are infinite, and of infinite felicity and art. One can hardly help smiling pitifully when one finds Mary Stuart thus addressing a subject and a known libertine :—

"What heart have you to hurt me ? I am no fool
To hate you for your heat of natural heart.
I know you have loved and love not all alike,

But somewhat all : I hate you not for that.
When have I made words of it ? sought out times
To wrangle with you ? crossed you with myself ?
What have I said, what done, by saying or deed,
To vex you for my love's sake ? and have been,
For my part, faithful beyond reach of faith,
Kingdomless queen and wife unhusbanded,
Till in you reigning I might reign and rest."

Bothwell himself is drawn with equal skill and success. An ordinary and rather brutal nature, whose coarseness is mistaken for strength, and whose principal motive is an ill-considered ambition half afraid of the means which it must use, he becomes fretful, and loses head under the difficulties of the position he has coveted, and lacks both the skill and the courage to pluck safety from danger. Perhaps the only figure which is somewhat overdrawn is Darnley. Mr. Swinburne appears to us to have succumbed to temptation in a manner very unusual with him, and to have seized, a little too eagerly, the obvious method of justifying, or at least explaining, the conduct of his heroine by overcharging the faults of her husband. The ordinary contemptuous charity with which one thinks of Darnley as of a mere "booby who had fine legs," may be—probably is—misplaced ; but it may be doubted whether such a monster of combined cowardice, folly, presumption, fretfulness, and ingratitude as is here exhibited could ever really have existed. Yet, although the design be faulty, one almost forgives its faults in considering the excellence of its execution. The third scene of the first act, in which Darnley prefers his idle and incoherent complaints to the Queen, only half aware of the bitter irony with which she receives them ; the sixth scene of the second act, in which his insane fretfulness and cowardice lead him to try to pick a quarrel with Murray ; and the seventeenth of the same act, in which through distrustfulness he rejects the last hope of safety, proffered by Lord Robert Stuart, are all masterpieces of dramatic construction and language. But perhaps the finest scene in which he appears, dead or alive, is that in which the queen and Bothwell visit his corpse. The contrast between the impassive and analytic calmness of the one, and the unquiet discomfort of the other (on whom sits all the awkwardness of a vulgar murderer in presence of his victim), could not be better worked out ; nor would it be easy to surpass in power the wife's description of her murdered husband :—

"His cheek
Is not much changed, though since I wedded him
His eyes had shrunken and his lips grown wan
With sickness and ill living. Yesterday
Man or no man, this was a living soul ;
What is this now ? This tongue that mourned to me,
These lips that mine were mixed with, these blind eyes
That fastened on me following, these void hands
That never plighted faith with man and kept,
Poor hands that paddled in the sloughs of shame,
Poor lips athirst for women's lips and wine,
Poor tongue that lied, poor eyes that looked askant,
And had no heart to face men's wrath or love
As who could answer either—what work now
Doth that poor spirit that moved them ?"

We have unfortunately not space enough to notice at length the lesser characters, which, however, will well repay the minutest study, being drawn with the utmost care and individuality, and projecting themselves upon the mind with the same astonishing

clearness which distinguishes the principal figures. The balanced uprightness and respectability of Murray, the policy of Morton and Maitland, the shifting half-heartedness of Huntley and Argyle, all body themselves forth in vivid reality. Knox, of whom Mr. Swinburne takes a rather favourable view, is another striking portrait, and so is Lord Ruthven, whose farewell scene with Murray is so wonderful in cunningly judged pathos, that part must be quoted :—

Murray. "But in this trust, though loth I take farewell,

To give you welcome ere the year be dead.

Ruthven. Me shall you not, nor see my face again,
Who ere the year die must be dead ; mine eyes
Shall see the land no more that gave them light,

But fade among strange faces ; yet, if aught
I have served her, I should less be loth to leave

This earth God made my mother.

Murray. Then farewell,

As should his heart who fares in such wise forth

To take death's hand in exile. I must fare
Ill now or well I know not, but I deem
I have as much as you of banishment
Who bear about me but the thought of yours."

But the greatest success among all the minor personages is unquestionably Mary Beaton. The depth and fulness of meaning which the author has managed to put into her few words is surprising. Being, as she is, the embodied *risée* and Fury of Chastelard, fastened to the Queen by an indissoluble bond of covert hatred, she shows this in no flourish of language or impertinence of soliloquy, but only now and then in sombre sentences of double meaning, which recall the Clytemnestra of Aeschylus as she welcomes her returning lord. The rendering of this character alone would place Mr. Swinburne in the front rank of dramatists. Nor can we pass over without laudatory comment his most praiseworthy abstinence from soliloquies in general. They are only too welcome to the ordinary dramatist : first, as a convenient means of explaining and helping on the action which he is not strong enough properly to evolve ; and, secondly, as useful occasions for introducing fine things. In this, as in many other instances, Mr. Swinburne has proved himself superior to ordinary tricks and artifices, and able to produce great results with the simplest apparatus.

It remains now that we should say a few words as to the workmanship or purely formal part of this great poem. Few will be needed—not that we hold this matter to be unimportant, since it is indeed the very soul of poetry, but simply because in this department Mr. Swinburne's spurs are not now to win. All who know anything of English verse, know that among its craftsmen there is no surer hand than his. There is, perhaps, one point in which the book gives a handle to small criticism, and that is its length. This, no doubt, far exceeds what is usual in a drama, whether intended for the stage or the study. But it must be remembered that this is purely an accident. Had the author chosen to cast his work in epic form, no one would have considered it too long ; and the privilege of elaborate treatment ought not to be denied him, because he

has (as we think, most wisely) preferred the more vivid if more difficult presentment of the drama. Nor can it be alleged for a moment that, bulky as the work is, it is in any respect undisciplined or diffuse. Every line contributes its share to the general effect and action; every line shows signs of the severest and most careful censure. In one respect there is even a marked improvement upon the author's earlier work. Mr. Swinburne used to be not quite free from the fault of overloading his lines with epithets, appropriate and picturesque enough in their immediate place, but often tending to obscure the general force of a passage, or at least to produce a somewhat too *flamboyant* effect. The severest critic will have no such fault to find with *Bothwell*. Quotation, indeed, is an easy task, and the passages already cited will have shown sufficiently the marvellous variety and vigour of the verse, the precision of the language, the fire and gravity of the style; but it may not be out of place to give the following as an additional illustration of these excellences:—

Queen. "I never loved the windless weather, nor
The dead face of the water in the sun;
I had rather the live wave leapt under me,
And fits of foam struck light on the dark
air;
And the sea's kiss were keen upon my lip
And bold as love's and bitter; then my soul
Is a wave too that springs against the light
And beats and bursts with one great strain
of joy
As the sea breaking. You said well; this
light
Is like shed blood spilt here by drops and
there
That overflows the red brims of the cloud
And stains the moving water: yet the waves
Pass and the spilt light of the broken sun
Rests not upon them but a minute's space:
No longer should a deed, methinks, once
done
Endure upon the life of memory
To stain the days thereafter with remorse
And mar the better seasons."

It would be impossible for anything to excel this writing either in intrinsic excellence, or in appropriateness of place and time; for it is spoken on the sea shore at Alloa, in the days immediately preceding the formation of the plot against Darnley's life. Of lyric work there is not much in the volume; but what there is, is in every way worthy of its frame and setting.

Incomplete as any study of such a poem as *Bothwell* in the space at our disposal must necessarily be, we hope that enough has been said to show in some measure its importance, and its altogether exceptional completeness of execution as well as of design. In the many thousand lines which compose it we have hardly, after repeated and careful reading, found one blemished or inharmonious verse: in all its complicated delineations of character we have hardly (excepting in the instance before mentioned) found any blurred outline or faulty draughtsmanship. It is perhaps too early yet to assign to *Bothwell* its proper place in English poetry, although that place is to us beyond doubt or question. Suffice it to say, that perhaps the most tragic figure in English story has at last been vindicated from the merely external portraiture of Scott, and the disastrous mixture of sentiment and piety which, in an evil moment for his fame, was compounded by

Schiller. Still it must be remembered that Mr. Swinburne's work is not even yet wholly done. He has shown us in *Chastelard* the *πρώταρχος ἄρρ*, the original treason to "the Lord of terrible aspect;" he has drawn in *Bothwell* the *νεάζοντα ὕβρις*, the murder of Darnley, with its attendant folly and crime; he has now to complete the trilogy, and to embody in his completion the final expiation. When he shall have done this, and have completed at Fotheringhay the action begun at Holyrood, and continued at Craigmillar, it will be time to look at other dramas and other literatures, to see what work may be found with which this may be matched in dramatic completeness and force. But we are sure that had he never written anything but the work before us, though we might have been ignorant of the range and variety of his poetical gifts, though we might not have known that his lyrical powers were as great as those here chiefly shown, yet there could have been no doubt in the mind of any competent judge that by this play its author had won a place, second to few dead and to fewer living, among the occupants of the heights of the English Parnassus.

GEORGE SAINTSBURY.

Waterloo Lectures: a Study of the Campaign of 1815. By Colonel Charles C. Chesney, R.E. Third Edition. (London: Longmans & Co., 1874.)

In a recent number of the ACADEMY we adverted to the reputation obtained on the Continent by Colonel Chesney's *Waterloo Lectures*. Translations in French and German have not only placed its lessons at the disposal of military students in both countries, but occasioned careful researches for additional evidence on certain doubtful points. In two instances the result has been to clear, to a certain extent, the characters of both victors in that struggle of giants from imputations of neglect on the one hand, and false, or rather inexplicable, strategy on the other.

It has hitherto been supposed—and Colonel Chesney, in the two earlier editions of his work, was unable to obtain evidence to the contrary—that no communication of their defeat at Ligny was made by the Prussian staff till the morning after the battle. This, it is unnecessary to say, was fought late in the afternoon of June 16, and its closing scene was a charge of cavalry in which Blücher was knocked down and ridden over. Wellington, in the meanwhile, who had promised to support the Prussians should the attack on his own advanced corps prove insignificant, had had enough to do to hold his own against Ney at Quatre Bras. It has been supposed that in the hurry of retreat, with the general-in-chief wounded, the Prussians forgot to send tidings of their mishap to Wellington, whose position might have been gravely compromised by the omission; and Gneisenau, Blücher's chief of the staff, who commanded for the short time the old Marshal was incapacitated by his fall, has been much censured for the neglect, as well as Blücher himself.

But since the publication of the first edition of *Waterloo Lectures*, careful researches made in Germany have not only completely

disproved the charge, but satisfactorily explained the reason of its being made. It seems that just before the final attack at Ligny, Blücher had sent Major Winterfeldt, one of his aides-de-camp, to acquaint Wellington that he was forced to retreat. This officer,

"riding up to Quatre Bras with his escort to give Blücher's warning, was shot down by the French skirmishers on the chaussée near Pierrmont, and lay some time between their fire and that of the Nassauers before the latter rescued him. Of an officer who came to assist him, he begged only that his condition might be made known to the nearest general of rank; for he thought it improper, even in his wounded state, to make known such alarming news to a subordinate. No such person as he asked for could he get near him; and hence, though Müffling heard about dark, in the Duke's presence (as he tells us), of the aide-de-camp's wound, no word came of what his message was, and it was probably thought to be of small importance. For this mistake, however, we may censure Müffling himself, or possibly the stiffness of character which first took Major Winterfeldt unnecessarily near the line of French skirmishers, and, when wounded by his own temerity, made him keep the message close. Neither Blücher nor Gneisenau—now that the truth is made clear—can any longer be charged with the supposed neglect to let their ally know that the battle had gone against them; though it is fair to add that some additional precautions might well have been adopted by the latter, after he had taken command, and the fighting had come to an end, to acquaint the English general with the actual condition of affairs in so vital a point of the campaign."

Major Winterfeldt, whose foolhardy conduct and thoroughly German pigheadedness thus imperilled the cause of the allies, appears to have been reticent on his share in this important incident, as it has never until now appeared in any history of the campaign, although he died recently in Hanover, a retired lieutenant-colonel, at the advanced age of ninety-four.

The second point which has been corrected in this edition refers to a subject more interesting to Englishmen, as touching the reputation of their great Captain as a strategist. It will be remembered that Wellington's line of battle at Waterloo was formed immediately in front of the wood of Soignies, covered by which it is supposed he intended to retire on Brussels in case of necessity. This determination has been a subject of much controversy—Napoleon himself being among the hostile critics—though the balance of opinion is decidedly in Wellington's favour. Less defensible has appeared his retention of 18,000 of his best troops at Hal, whose presence at Waterloo would have made "assurance doubly sure." This grave error, if not excused, is explained by a statement made by himself in 1821 to the Dutch general, Siegler,

"to whom Wellington, after his visit to the ground, declared as follows, illustrating his remarks as he spoke by a pencil sketch: 'The last hour of the battle was indeed a trying one to me. But I should not have retreated on the wood of Soignies, as Napoleon supposed, thinking that I should fall back on Brussels and the sea, but should have taken the direction to my left, that is towards Wavre, which would have given me the substantial advantage of drawing near the Prussian army.' As it would plainly have been impossible to carry off his right wing in the direc-

tion indicated, it must have been divided from him, and made a distinct retreat westward. And this possibility gives the most proper solution ever offered of his obstinacy in retaining the troops at Hal, which would have proved of real service in forming a rallying-point for the force thus to be left separated under Lord Hill."

This design is in accordance with the disposition of the British army on the field, which shows that Wellington looked for the principal attack on his right wing. As is well known, assaults were made on his right and left centres alternately, those on the latter proving most nearly successful. Had either of them been completely so, the plan of retreat on the Prussians could have been effected only by considerably the smaller half of the army; the centre and right must have fallen back on Brussels or Hal.

Altogether the explanation is only so far satisfactory as furnishing a motive for the retention of so large a force at Hal. The fact remains, as Colonel Chesney says, the one blot on Wellington's conduct on the day of Waterloo which time has not long since cleared away.

Although it is not usual to make reprints the subject of separate reviews, we have thought the two additions made to the third edition of *Waterloo Lectures* of sufficient importance to place them in detail before our readers. Neither industry nor chance is likely to add any more facts throwing light on the history of the "Three Days' campaign;" and we may safely predict that the book, in its present form, will take a foremost place among the classics of military history.

In Berlin it has been honoured with an official translation by the War Department. In Paris, on the other hand, a French translation was making it too popular among military readers to suit the Imperial Government, ever jealous of attacks on the "Légende Napoléonienne." A rival *Waterloo Lectures* of very different tendency was therefore published, an exact reproduction of Colonel Chesney's book in everything but the text. For the discovery of this curious instance of paternal government we are indebted to the *Saturday Review*. O. ST. JOHN.

THE HEREFORD "MAPPA MUNDI."

Mediaeval Geography; an Essay in illustration of the Hereford Mappa Mundi. By the Rev. W. L. Bevan and the Rev. H. W. Phillott. (London: E. Stanford, 1874.)

THE expression "Mediaeval Geography" as used with reference to maps made in Europe in the Middle Ages, covers a range of time in which the instruction conveyed was by no means so unprogressive as the term might seem to imply. If the Middle Ages were the "dark ages," of which the fifteenth century has been rightly named the last, we at least can trace in the cartography of the two last centuries of that so-called "dark" period an amount of light far in excess of that which was visible up to the close of the thirteenth century. Indeed, one might almost say that the commencement of the fourteenth century constituted the turning point between the geography of superstition and the geography of progress. The grand map in Hereford Cathedral, which has been

recently reproduced in lithography with great care, is one of the most remarkable examples of the former class. Had Prince Henry the Navigator (born 1394, died 1460), when he addressed himself with so much zealous perseverance to the acquirement of all the attainable geographical knowledge of his day, and to its development by persistent explorations at sea, been limited to the information that could be culled from the Hereford map, it is to be feared that the grand result of the discovery of half the world within the range of one century would never have been realised. But to each century its own honour. We have to accept facts as we find them. Those important explorations by sea and land which commenced in the same half-century in which the Hereford map was made (1250 to 1300), and which supplied the new geography which fired the enthusiasm of Prince Henry, were not yet brought within the ken of the English map-maker. From Carpini, Ruysbroeck, and Marco Polo, &c., in the East, from the Venetian voyages to Flanders and the Genoese Atlantic explorations in the West, we derive such maps as the anonymous one in the Laurentian Library at Florence of the date of 1351, that of the Venetian brothers Pizzigani at Parma of 1367, and the famous Catalan map of 1375; and by the light of these fourteenth century maps, anterior though they were to the great discoveries of the Portuguese, we are enabled, even at the present day, to rectify errors and establish truths in the history of discovery—an advantage which we shall never derive from the Hereford map. The latter is, nevertheless, the most magnificent specimen we possess of the class to which it belongs, and, as a mediaeval map, is second only in splendour of execution to that grandest of all cartographic productions, the *Mappa Mundi* made at Venice in 1457-59, at the instance of Prince Henry the Navigator, and at the expense of his uncle Alfonso V., by Fra Mauro, of the Camaldolese Convent of San Michele de Murano. On account of the beauty and excellence of this map, a medal was struck by the Republic in honour of the author, on which he was described as "Cosmographus incomparabilis." The Hereford map, though not so large as the Venetian one, which is more than seven feet square, is remarkable for being drawn on one single skin of vellum sixty-five inches long by fifty-three. The name of the author is given in the following Norman-French inscription at the corner of the map:—

"Tuz ki cest estoire ont
Ou oyront ou liront ou veront
Prient a Jhesu en deyte
De Richard de Haldingham e de Lafford eyt pite
Ki lat fet e compasse
Ki joie en cel li seit done."

There being no date on the map, this inscription is very valuable, not only in helping us to the personality of the author (who from his habiliments and the accompaniments of the chase, appears to have been a right merry priest), but to the approximate period of the execution of the work. The recently published facsimile, for which we are indebted to the Rev. Canon F. T. Havergal, of Hereford, is accompanied by an octavo

volume in illustration of the map, by the Rev. W. L. Bevan and the Rev. H. W. Phillott. These gentlemen have spared no pains to track the details of the author's biography as far as possible, and we shall presently see how importantly their researches bear upon the much-disputed question of the date. So diverse have been the opinions on that subject, that the two extremes cover the range of an entire century. The Polish geographer, Joachim Lelewel, assigned to the map a date as early as 1220; while the distinguished French geographer, M. d'Avezac, conjectures for it the year 1314, which he founds upon the observation of an inscription on the map "Terminus Franciae et Burgundiae," which, commencing near Paris, stretches across the Saone and the Rhone to the line of the Alps, leaving Lugdunum (Lyons) on the left hand, and Vienna (Vienne) on the right hand, each at some distance from the inscription. M. d'Avezac considers that the inscription bears especial reference to these two towns and to the political separation of Flanders from France; and as the year 1314 was signalised by the march of the King of France against the Count of Flanders, he selects that year as the most probable for the execution of the map. Any opinion of M. d'Avezac's must always be received with great respect, and, considered individually, the observation is ingenious, and the argument reasonable. Mr. Bevan, however, with all becoming deference to the suggestion of the venerable and honoured Membre de l'Institut, adduces reasons to the contrary which certainly lie closer to the individual history of the map itself, and as far as high probability can be accepted as argument, appear all but conclusive. Mr. Bevan points out that the inscription pointed to covers so much space that it is difficult to define the precise locality to which it refers, and that there is nothing to show that the word "Flandria" on the map implies political separation, or anything more than a territorial designation.

Now, in the above-quoted legend we have seen that the author styles himself Richard de Haldingham and de Lafford. Lafford is an old form for Sleaford, in Lincolnshire, in which parish is also the hamlet of Haldingham. Lafford is still the title of a prebendal stall in Lincoln Cathedral, which previous to 1283 was held by one Richard de Bello, who is found to have been treasurer in Lincoln Cathedral apparently between 1250 and 1260. In 1276 he still held this post. The vicarage of Lafford was founded when Richard de Bello was prebendary, and it was in his capacity of patron that he presented Henry of Swinderby to the living. The contemporary ecclesiastical documents style him "De Lafford." Hence we have the individuality of the author established. Now for the date of the work.

Richard de Bello resigned his prebend in 1283, and his connexion with Hereford Cathedral did not commence until 1305, when he was appointed to the prebend of Norton. Now it is obvious that if he had drawn the map while at Hereford, he would have called himself "De Norton;" if in the interval between his resignation of the one prebend and acceptance of the other, he would have called himself "De Bello;" but

as he calls himself "De Haldingham and De Lafford," there is no room for doubt that it was while he was yet at Lincoln; and when we turn to the map, and find that Lincoln is represented by a magnificent edifice, and Hereford by a meagre outline, we have a confirmation of this conclusion which few will not readily admit. After well weighing all the evidence, Mr. Bevan places the date at about 1275. As to the contents of the map, we have already spoken of what they are not; we will now say something of what they are. The "Mappe Monde" is, in fact, a rough indication of the respective positions of the different countries of the world and their leading geographical characteristics, with an intermingling of numerous legends and representations of various animals and varieties of the human race according to the fanciful notions of the Middle Ages. In this respect it resembles, in some degree, the narrative of Marco Polo, and would form an admirable subject for illustration by Colonel Yule, whose vast learning, both oriental and European, has made his recent edition of the Venetian's story an honour to this country, and one of the noblest productions of the present century. Right well also have the present editors fulfilled their task. With faithful clearness they have indicated the sources from which De Bello derived his materials for each portion of his work, and that the reader might not be left in darkness respecting those sources, he is supplied in the "Introduction" with brief notices of all the ancient authorities from Pliny downwards, even to the mediaeval geographical writers. The Introduction also contains a short but admirable dissertation on the Arab and Latin schools of geography, on the form and divisions of the world in mediaeval maps, and on their usual contents, which are divided into biblical, classical, legendary and contemporaneous. In addition to these is given a list, with separate notices, of all the mediaeval Mappae Mundi existing in this country, and it is a very rich and highly interesting one. Indeed, so well have the editors acquitted themselves of their task, that their octavo volume might fairly be called, within its limits, a Manual of Mediaeval Geography. As valuable accessories to the work, a miniature photograph facsimile of the Hereford map is given as a frontispiece; a photograph of a contemporaneous map in a Psalter in the library of the British Museum; and a photograph facsimile of a portion of the Hereford map of the full size of the original.

The geography of the map is derived mainly from Pliny, either direct or from his epitomists, Solinus and Marcian Capella, from Orosius, from Isidore of Seville, and from Priscian. These authorities are specified on the document itself, but the editors have detected the influence of the *Antonini Itinerarium* in the topography of Northern Africa, the derivation of the legend of the Seven Sleepers from Paulus Diaconus, the description of Constantinople from William of Malmesbury and a variety of subjects from the Alexandrian Romance. The author appears also to have had at hand a Bestiary and a Herbarium to supply him with materials for the natural history. Jerusalem,

in accordance with the ecclesiastical geography of the time, is made the centre of the map, which, as it forces the whole habitable globe within the compass of a circle, squeezes lands and seas into spaces by no means adapted to their natural proportions. The upper portion of the map is devoted to Asia, and the lower, divided into two parts by the Mediterranean, contains Europe and Africa, the former having the larger share. The whole is surrounded by the Ocean after the Homeric fashion. Under these conditions, the reader will readily endorse the editors' remark, that "viewed in a strictly geographical aspect, as a representation of the world at the time of its execution, the map would not repay any one for the time spent in its study." It is in truth not a subject so much for the geographer as for the antiquary.

Type, as the Hereford Mappa Mundi, however, is of the unscientific geography of its time, and presenting (to use its own words) an "Estoire" or history of what was then known, we are glad to remark that among its numerous ecclesiastical legends there is no appearance in its Ireland of the story that that island was indebted to St. Patrick for its exemption from snakes and vermin. This may be accounted for by the fact that the author had before him, as an authority, Solinus, who lived two hundred years before St. Patrick went over to Ireland, and who distinctly states that "Ireland has no snakes." Of the pictorial, as distinguished from the legendary myths of the map, the most conspicuous are: the "arbre sec" or dry tree, in the neighbourhood of Paradise, on the confines of India, doubtless derived by the author from the Alexandrian Romance, although in truth the legend is composed of more than one story. It appears to be the Chinar or Oriental plane. Between the Hydaspes and the Indus are two birds with the inscription "Avalerion, par in mundo." The old bestiary books tell us that the alerion is a bird larger than an eagle, of which there is but one pair in the world. They live sixty years and then lay two eggs, after the hatching of which they fly to the sea and drown themselves, the young ones being nursed by other birds till they can fly. Beyond the Indian Caucasus, or Hindoo Koosh, we find a figure screening himself from the sun with his own foot, a story derived by Pliny from Ctesias, who wrote in the fifth century. Another marvel of creation derived from Ctesias is the monoceros or unicorn, an animal which probably derived its existence in story from loose descriptions of the rhinoceros, the more modern form having arisen from the planting of a narwhal's tooth on the forehead of a beast like an antelope, the final result being derived from descriptions varying from time to time. But those who wish to amuse themselves with these curious myths must get the map and study them at leisure.

On the ornamental border of this map is a Latin legend which tells us that "the world began to be measured by Julius Cesar: the whole of the East was measured by Nicodorus; the North and West by Theodotus; the South by Policlitus;" and the Emperor on his throne is represented as

giving his written orders to these commissioners. The reference would seem to be (with allowance for a mistake in the Emperor's name) to the survey ordered by the Emperor Augustus in connexion with the census alluded to in Luke ii. 1. The space at the top of the map is filled up with an elaborate representation of the Day of Judgment, and the letters M O R S are placed respectively at the four angles of the world, as if to show the transitoriness of all the great objects which the map depicts.

Imperfect copies of this map have been made before. There is one in the Map Room of the Royal Geographical Society, and from this a copy was made in 1841 for the Bibliothèque Nationale in Paris; from this again an uncoloured facsimile was introduced by M. Jomard in his *Monuments de la Géographie* (Paris, 1855). But Mr. Haverall need take no shame to himself that he has been anticipated by these. A perfect facsimile made in 1872 is worth a vast deal more than an imperfect one made forty years before; and, if we pass from the map to the illustrative essay, we feel bound to say that it does the greatest honour to the learning, the clear-sightedness, and the conscientiousness of its authors. None but those who have had experience in similar tasks can well conceive the amount of toil which such an *improbable labor* must have cost them.

R. H. MAJOR.

A Fragment of the History of Austria under Ferdinand I., 1519-1522: a Picture of the Party Struggles in the Diets, from Original Sources. By Professor Victor von Krauss. With an Appendix containing Letters and State Papers of that Period. (Vienna: Alfred Hölder, 1873.)

PROFESSOR V. VON KRAUSS published as early as 1871 a contribution to the History of Ferdinand I., entitled *English Diplomacy in the year 1527*. In this work, he gives an account of the embassy sent by the brother of Charles V. to Henry VIII. for the purpose of inducing that monarch to side with him in the struggle for supremacy in Hungary, to explain the causes of the attack threatened by Turkey, and above all to gain a promise of subsidies. In this last product of his remarkable industry, Victor von Krauss touches upon another section of the history of the same prince, a section that concerns important territorial questions, rather than questions of European interest. The subject before us is a narrative of the singularly violent opposition made by the Austrian Estates to the Archdukes Charles and Ferdinand after the death of their grandfather Maximilian, the struggle which resulted from this opposition, and the final triumph of the Archduke Ferdinand.

As far back as in the time of Maximilian, the cry for a change in the form of government, for improvement in the administration, for reform in the departments of law and of finance, and for the dismissal of unpopular counsellors had grown more and more clamorous in the hereditary states of the house of Habsburg. Shortly before the end of his life extensive concessions had been obtained, but his death rendered the realisation of these very doubtful. One clause of

his will decreed that until the arrival of the new rulers the hereditary provinces should submit themselves to the existing government. Indeed, in its earlier form, this clause conceded to the executors of the will the right of making such changes in the government as should approve themselves to their judgment. This called forth the opposition of the Estates. The united representatives of all the provinces: Austria above and below the Enns, Styria, Carinthia, and Carniola, demanded that the new rulers should first bind themselves by oath to confirm their liberties and privileges, maintaining that until this was done they owed no allegiance to them. The Diet of each province appointed a kind of provisional government. Assurances of loyalty towards the new sovereigns were accompanied by attacks on the crown estates, and a plan was mooted for a common government for all the provinces together, which should be entirely under the influence of the Estates. In this movement Vienna took the lead. At its head stood Martin Siebenbürger, a veteran in the struggle against the former government, an experienced lawyer, and a passionate enthusiast. A constitution greatly in favour of the provincial diets was drawn up and adopted, possession was taken of the Kammergut, the crown dues, the government records, and a new coinage was even issued, of which specimens are still extant.

Through the influence of the towns, the movement acquired a more radical tone in Vienna, and indeed throughout Austria below the Enns, than in the remaining provinces. While therefore these latter, as well as Tyrol, which had joined the opposition, came to an amicable settlement with the Archduke, the movement in the former had a tragic issue.

The great embassy which the deputies of Lower Austria sent to Spain gave occasion to the ambassadors of Austria Proper—among them the bold and eloquent Siebenbürger—to make a much more determined stand than their colleagues. After a while, open contention soon broke out between the Radicals and the more moderate party. When Charles V., in his own and his brother's name, delegated to the Imperial Court of Regency at Augsburg the administration of the patrimonial estates of Austria, and its Commissioners summoned these provinces, without further ceremony, to pay homage, obedience was rendered by Carinthia, Styria, and Carniola, and even by Austria above the Enns, which yielded without demanding a previous ratification of its privileges. In Austria below the Enns universal resistance was threatened, until a cautiously calculating policy everywhere succeeded in superseding the party of action, of which Siebenbürger was the soul, and in severing and entirely isolating it from the Estates. To give details here would lead us too far. At length Vienna—where, at the end of 1520, Siebenbürger had been elected burgomaster, as a demonstration against the Archduke—stood quite alone.

Archduke Ferdinand, in whose favour Charles V. had, in April, 1521, abdicated his rights to his hereditary possessions in Germany, determined to punish his opponents. He instituted a court, composed for the

greater part of foreigners and of persons who had no connexion with the provinces, to judge between the former government and those who had risen against it and had adopted the Constitution (Landesordnung) of 1519. Judgment was given against the latter; the original promoters of the rebellion were cruelly executed, Siebenbürger among them. One only was exiled.

Thus the principle of the liberty of the States, not altogether undeservedly, fell before the principle of territorial lordship. The occurrences are skilfully narrated by the author, who has carefully collected his materials from eight archives, more especially from those of Vienna, Gratz, Krems, and the manuscripts in the Court Library of Vienna. The value of the work is enhanced by a criticism of the sources and collateral contributions which throw light on the period in question, as well as by other supplementary additions based, for the greater part, on the Government records.

While I point out a trifling error in the note on p. 12, a transcription from the *History of Ferdinand the First* (i., p. 480), by Bucholtz, viz., that "Georg Pleischer" should doubtless stand as Georg or "Gregor Reysch" (Bucholtz i., p. 165, has the further variation "Jörg Fleischer"), I would conclude with the wish that Professor von Krauss may yet enrich us with a history of Ferdinand I. that shall supersede the unreadable compilation of Bucholtz.

ALFRED STERN.

Old and New London: a Narrative of its History, its People, and its Places. By Walter Thornbury. Illustrated with numerous Engravings from the most authentic Sources. Vol. I. (London, Paris, and New York: Cassell, Petter, & Galpin.)

Of the numerous books which Mr. Thornbury has produced during the last twenty years this is about the best. It has very considerable merits. It forms a handsome and attractive volume, it is well got-up, it is liberally illustrated, and is a marvel of cheapness. It is written in a lively and readable style, and is a perfect storehouse of anecdotes, for the most part well-chosen and very fairly told.

But while we gladly bestow this measure of approval, we are bound to add that the book has very serious faults. It deals as largely with gossip as with history. The authentic and the unauthentic are mingled together without any note of difference. Occasionally the statements are in accordance with the most modern historic lights—more often they belong to the historic schools represented by Goldsmith's *History* and the *Waverley Novels*. Thus Mr. Thornbury designates Cassivelaunus as "King of Hertfordshire and Middlesex," and supposes that there was a period in English history "when Norman barons were not unaccustomed to pull out a Jew's teeth, or to fry him on gridirons, till he had paid handsomely for his release" (p. 761).

Even when the author comes across a fact of real significance, he does not always seem to appreciate its importance. Thus, in the reign of Edward IV., the Lord Mayor ordered two men who had struck him, to be

beheaded. Mr. Thornbury duly chronicles the fact, but he does not apparently perceive that, in the penalty of treason thus summarily inflicted for an offence against the person of the Mayor, he has lighted on a curious exercise of the *jura regalia* which were formerly possessed by the Free Cities of Europe; rights which, in the case of Hamburg or Bremen, were developed into full and complete independence of the overlord, while in the case of London they gradually gave way before the paramount power of the Crown, leaving however, even at the present day, one or two curious survivals, such as the right possessed by the citizens to elect their own sheriffs; or the custom which compels the Sovereign, when he visits the City, to knock at the closed gates and ask for admission, as a matter of favour rather than of right.

Almost every historical personage who is mentioned in Mr. Thornbury's pages is labelled with a descriptive adjective. This practice would be less offensive than it is, if these brief estimates of character possessed any real biographic value, instead of merely reflecting a somewhat Philistine view of English history. Thus, Henry VIII. is either "the bluff king," or else "that Ahab of England." We have of course "the good Ridley," "gloomy Queen Mary," and "the child King" who preceded her. Wolsey is either "the proud favourite" or "proud and portly." Theodore Hook is in turn the "greedy hireling," or "the witty and the heartless;" while the author of the *Ingoldsby Legends* is pilloried as "the un-reverend Mr. Barham." Sometimes in the course of a few pages Mr. Thornbury altogether reverses his historical estimates. Thus, on p. 74 we have "poor persecuted Queen Caroline," and a few pages further on she becomes "that questionable martyr." But Mr. Thornbury's facts as well as his opinions develop with the progress of the work. When, as is occasionally the case, the same story is inadvertently told more than once, a ready test is afforded of the author's habitual accuracy. Thus at p. 74 Theodore Hook is invested with the "Consulship of the Mauritius," and his debt to the Crown is only 12,000*l.*, while at p. 110 he is promoted, very properly, to "the Treasurership of the Mauritius," and his defalcation has increased to the sum of 15,000*l.*

A topographical and historical work pretending to any authority demands, we will not say a copious citation of authorities, but at all events some sort of indication of the sources from which the accounts are derived. It is here that we have the gravest fault to find with Mr. Thornbury. Whole pages are transferred bodily from nameless writers. In one place we find an entire column, as to which the inverted commas in which it is included form the only indication that it is a quotation. Elsewhere we have long quotations from "a writer who was present," or from the works of "an eye-witness." We have two columns about Heralds' College, which are included in inverted commas, prefixed by the vague acknowledgment "we are told;" and, still worse, we have six or seven columns about Hazlitt, extracted from the works of "a contemporaneous writer,

of whose labours we gratefully avail ourselves."

But when Mr. Thornbury does condescend to name his authorities, the result is usually so unsatisfactory as fully to justify his customary reticence. *Pickwick*, *Vanity Fair*, and *Henrietta Temple* are laid under contribution. Other authorities cited are nearly as worthless. Judging from the evidence which Mr. Thornbury himself supplies, the book has been chiefly compiled from second-hand authorities, and even these seldom belong to the first class. Thus the details as to the periodical press are mainly taken from the notorious work of Mr. Grant, those relating to law and medicine from Mr. Jeaffreson, while even the writings of Mr. Sala are not deemed unworthy of lavish quotation. It is only fair, however, to add that we get occasionally as far as Mr. Timbs, Mr. Noble, Mr. Francis, and even Mr. Riley, and on one memorable page we have "a very admirable passage from Mr. Freeman."

This singular combination of the authentic and the unauthentic which characterises the text is faithfully reflected in the woodcuts. The title-page asserts that the numerous engravings are taken "from the most authentic sources." This description applies fairly to a portion of the woodcuts. Some are in every way admirable—there are many more of which the less said the better. On the one hand, we have excellent copies of some of the best extant portraits of historical characters, we have topographic sketches of buildings and antiquities, carefully drawn and capably engraved, as well as a large number of well-selected and most appropriate reproductions of old prints. Interspersed with these excellent woodcuts, which merit all praise, we find numerous sensational "illustrations" of executions, riots, processions, tea-parties, and interviews between celebrated characters. These "illustrations" have evidently been evolved out of the internal consciousness of some anonymous modern designer, and are only to be distinguished from the engravings of a more authentic order by the internal consciousness of the hapless reader.

Owing to these causes, a great work, which has evidently been produced at a very large expenditure of capital and labour, and which might usefully have filled a real gap in our literature, is rendered nearly useless for library purposes, and cannot be referred to with any confidence or safety.

The absence of a date on the title-page seems to indicate that the book, with all its faults, has already been stereotyped. If this should not be the case, we advise Mr. Thornbury to take counsel with some friend who possesses the historic instinct and the requisite knowledge, and then with some trouble and a little good advice he may make a second edition into a really valuable and standard work.

ISAAC TAYLOR.

Hours in a Library. By Leslie Stephen. (London: Smith, Elder, & Co., 1874.)

IN an unpleasant sketch of Balzac's there occurs a rather amusing parody of the manner of St. Beuve. Nathan is supposed to have related some impertinent *mot* of a character whom he is describing, and he

goes on to criticise it thus: "I scarcely think the Greeks and Romans were acquainted with this kind of wit; Plato, perhaps, if one looks very closely, may have come near it, on the grave and musical side." Mr. Leslie Stephen's collected essays are in strong contrast to this sort of dilettanteism, which is growing too common in English literature. There are three contemporary schools, all with their value, but all with the faults of their qualities. There is the school of M. Taine, who only needs a slight acquaintance with the climate, and productions, and history of a country, to dash off a series of formulae showing that this or that painter or poet was the necessary result of the conditions. Then there is the school of M. Paul de S. Victor, who uses his subject as the ground of the most brilliant broidery, and produces effects so dazzling that, as Lamartine said, he needs to be studied through blue spectacles. Lastly, there is the school which, in Mr. Stephen's own words, "is never satisfied with its frame of mind, till it has lashed itself into a fit of rhetoric," or has dreamed itself into a hazy reverie. It looks at all things as the author of *Alice in Wonderland* advises the young poet to do, "with a kind of mental squint," which produces remarkable and gorgeous, but not very satisfactory visions. The reader feels that he has been led to see things as they are not, rather than things as they are. Now, it is Mr. Stephen's merit that he has written an amusing and instructive volume of studies, without leaning to the manner of any of these three sects of critics. With regard to the school of history and evolution, he remarks, "We have not yet learnt how to breed poets, though we have made some progress in regard to pigs." Nor is he much more confident as to the results of analysis: "the effort to investigate the materials from which some rare literary flavour is extracted is seldom satisfactory." Mr. Stephen does make the effort, in the case of Hawthorne, showing how the mystic and morbid part of his genius looks like an inheritance from the fears and fancies of Cotton Mather's time, and the witch panic at Salem; and how, again, the common-sense of his Puritan ancestry keeps him always on firm ground, and prevents him from obtruding his ghosts forcibly, or expelling them decisively. The result is that they wander in a world of doubt, as ghosts ought to do, and the sceptic can always explain them away into "the rats," or "the wind;" while the credulous can hold them to be genuine, and say, like Bartholo in *Figaro*, "Il n'y a point de vent dans le monde." But it is rare that Mr. Stephen is so subtle as this, and it is a thing to remark that he avoids the use of the words "subtle," "delicate," "precious," "sweet," "blithe," and "accomplished," these notes of macabre criticism.

These essays have many of the charms of interesting conversation, and the reader seems to be holding a continual dialogue with the author. Views are stated just as they occur to the writer's mind, without any effort at saying something fine or startling. There is a tendency to contradict notions that are fashionable, and it would not be very difficult, perhaps,

to find out a few of the things that Mr. Stephen would denounce if he yielded to the temptation of indicating some of the probable objects of Pope's antipathy. Thus there is a practical air about the essays, an alert interest, and a disposition to shun refining on things, which give them a freshness and a life that one misses in much more studied compositions. They deal, for the most part, with English literature—some of it literature that is sinking into the sere estate of Charles Lamb's "books that are no books." Such are the novels of De Foe and Richardson, which Mr. Stephen thinks have "fallen so dark to us," as Mr. Carlyle would say, because they were written when the English novel was in its infancy, and the laws of the game were scarcely settled. De Foe had to give verisimilitude by a painful process of accumulating details, and the leisure of quiet times did not object to the *longueurs* of Richardson. The details, the moral prosing, the enormous slow length *do bore us now*, and probably Mr. Stephen's extracts will be novelties to the majority of his readers. One feels inclined to differ from him where he says that "Mr. Veal makes rather a better point" (against Mrs. Veal's ghost) "by stating that a certain purse of gold mentioned by the ghost was found, not in the cabinet where she told Mrs. Bargrave that she had placed it, but in a comb-box." Now, this is in our opinion a piece of verisimilitude worthy of Meinhold, for the mistake is just the sort of lax blunder that ghosts and planchettes invariably do make. They come very near the mark, and drift off into some absurd error.

In the same way, when Mr. Stephen thinks that "remorse does not embody itself in these recondite and, one may almost say, over-ingenious fancies" that haunted Hawthorne's Mr. Dimmesdale, we are tempted to say of the critic what Bunyan said of the aged Christian who failed to console him when he thought he had committed the unpardonable sin, "I found him a stranger to much conflict with the devil." De Foe and Hawthorne seem to have been no strangers to any variety of vulgar superstition or insane self-deception. Again, Mr. Stephen notices, as a proof of the want of the passionate element in De Foe's novels, the singular calmness with which he describes his villains. Thus Roxana's "moral tone is all that can be desired," and indeed all the bad characters speak "like virtuous persons, who have unluckily backed the losing side." But surely this is a note of the real dying confession of the English ruffian. Students of these documents must have observed their business-like tone, the speakers always tracing their evil courses to one fall from virtue, after which they quite steadily took up the opposite line of conduct.

It is the pleasantest quality of Mr. Stephen's book, that it tempts the reader into almost conversational digressions. But one might notice many criticisms of a different value, such as that on Richardson, and his influence on the sentiment of France. "Clarissa doubtless transmigrated into the heroine of the *Nouvelle Héloïse*, dropping some of her insular prejudices on the way." "Richardson in fact, though the good orthodox little man had no suspi-

cion of his own tendencies, was encouraging a sickly and ominous tone of thought. The temporary eclipse of the priest, the natural spiritual guide of feminine natures, gave a chance to such lay preachers to enjoy a homage not altogether healthy to those who rendered or to those who received it." The last pages of the criticism on Richardson contain a life-like picture of the illustrious printer, and an explanation of his influence over De Musset, Balzac, and George Sand. The essay furnishes indolent people, if any essay can, with a sufficient notion of Richardson to satisfy their literary conscience for neglecting the long and dreary pilgrimage to the tomb of Clarissa Harlowe.

The essay on Pope as a moralist is mainly interesting as showing how we have wandered in our notions of poetry from the notions of Queen Anne's time. Pope, with his artificial jingle, was supposed by Dr. Johnson to have reached the bounds of musical expression. As a poet his one serious claim was his enthusiasm for the harmonious and orderly beauty of righteousness. We now expect to have the bizarre beauty of passion expressed in the melodious lapses of lyrics, or delight to watch the long processions that rise and pass before us to the music of "the idle singer of an empty day." Colour and grace seem to be divorced from noble action and passionate morality in our modern poetry. We have to go back to Greece to find these conjoined. It is scarcely possible, perhaps, to make the nineteenth century delight in Pope, but Mr. Stephen has succeeded in proving that he was a poet, *pius vates et Phoebæ digna locutus*.

In his essay on Scott, written apparently among the depressing festivities of the Scott centenary, Mr. Stephen keeps a happy balance between love of the novelist's character as a man, and regretful doubt as to the permanence of his work. But an untrue impression is conveyed when it is said that Scott's career was summed up in the phrase that "it was writing novels to buy farms with." Mr. Carlyle, when he said that, should have remembered that there are different motives for buying farms. Scott did not want them for the same reason as the Northern farmer did. He had a romantic love for the land, a romantic desire to found a new great house in the clan of Scott,—that was why he was so anxious to sign himself "Abbotsford and Kaeside." But it is hard for countrymen of "the sheriff," hard for anyone who merely recollects, for example, the tenour of Scott's conduct to Byron, to criticise his art. It is like peeping and botanising on a beloved grave, or finding fault with the commercial incapacity of Colonel Newcome.

If there is an essay in Mr. Stephen's collection which makes one miss a touch of the enigmatical and subtle school, it is that on Balzac. "It is not ordinary daylight which illuminates Balzac's dreamland, but some fantastic combination of Parisian lamps, which tinges all the actors with an unearthly glare, and distorts their features into extravagant forms." They live in the luminous shadow which Paris radiates from itself, the unholy living light of Baudelaire's *Rêve Parisien*.

They resemble, as M. de Pont-Martin says, the flora of some colossal hot-house, fashioned to shelter a foreign and fantastic vegetation, where all manner of exotics live together, till the visitor might forget that in the open air they would fall to pieces in an hour. In this palace of fancy it is not enough to be merely straightforward and clear-sighted, the critic should be infected with the fever of the master. That is why Mr. Stephen is not the best possible guide to the study of Balzac. He is much more satisfactory in his account of De Quincey, though we must protest that there is humour in the account of the combat between the Baker and the Amateur. It is humour of the *Bell's Life* variety, perhaps; but, then, what is so English as *Bell's Life*? Perhaps Mr. Stephen would say that such a notion of comedy is scarcely so much English, as a fruit of that mysterious quality of John-Bullism discovered by Hawthorne. One may take leave of his essays in saying that they are delightful in themselves, and useful as a tacit protest against the false tendencies of a clever and ingenious school of criticism.

A. LANG.

History of the Royal Artillery compiled from the Original Records. By Major Francis Duncan, R.A. Second Edition. (London: John Murray, 1874.) If any one has been disposed to cavil at the propriety of devoting to the services of a single portion of our army two volumes so ponderous and so well-filled as these, the answer is best supplied by the fact of a speedy demand for a second edition, which is now before us. We may fairly congratulate the author on this reception of his labours, as proving that they are appreciated beyond the immediate clientèle to which he specially addressed himself; nor less on the careful use he has made of his new opportunity in embodying the numerous corrections and additions which the circulation of the first edition had brought him. It can never be possible to give to a work which starts with so limited a subject as the acts of a single branch of an army, that sort of epic interest which great military historians know how to combine with sound narrative. The conditions are obviously fatal to this. In the particular instance before us, it is plain that a history of the Royal Artillery from the time that it first became an important element in our land forces early in the last century, would, if completely written, be nothing less than a history of our wars during this period. On the other hand, it would be fatal to all interest if the compiler of such a narrative confined himself entirely to describing the various steps taken from time to time to augment or diminish the regiment. To carry out his task creditably, he must steer carefully between thus making his work a mere abstract of War Office records, or enlarging it until it gets beyond the scope of the class for whom it is specially designed. Portions of general history, or of memoirs, must be judiciously selected and used liberally enough to win ordinary readers, without obscuring the real design of the work, which is to show the gradual process by which the arm we are now familiar with has grown to be the finished instrument it is. It is high praise, and yet it is mere justice to Major Duncan, to say that no author who has taken up such a task has performed it so successfully. Works of the kind, indeed, are seldom readable to those not personally interested. His is not only really pleasant reading, but in portions will be found to offer valuable contributions to history. There is a remarkable instance of this in his narrative of the battle of Minden; for the splendid services done there by our small contingent of infantry have hitherto caused the hardly less

honourable conduct of the Royal Artillery to be ignored. Many others might be cited; but we prefer to send our readers to the work itself, where they will find Major Duncan's industry as a collector of historical fragments is fully displayed; nor less so his good judgment in selecting from his heap of material. His honesty especially commends itself at such points as the note (vol. ii., p. 8), which gives the authority of Sir David Wood for the assertion that "much that is good in the care of the horses of the Royal Artillery in the field comes traditionally from the horse artillery attached to the German hussars in the Peninsula." Our professional military writers are not often thus clear in their acknowledgments of obligation to their German prototypes, though our army has been more or less modelled on the Prussian ever since the Seven Years' War. It would be untruthful, indeed, to pronounce Major Duncan's a perfect work. The inequality of both style and matter will strike even a careless reader, after the somewhat grandiose promise of the preface. The gallant author is hardly aware of what constitutes genuine authority for opinion, when he quotes at one point an invaluable old order or memoir, at another a passage from a recent occasional paper, written only for Woolwich eyes. As to his views on the organization of his own arm, it is enough to say that to him it appears the best possible of artilleries for all possible purposes. He affords, indeed, throughout a curiously patent example of the spirit he reproves at vol. i., p. 120: "It is undoubtedly a consequence of military training to produce in a man's mind more of an inclination to make the best of what is, than to suggest change and improvement." The truth is trite enough to be worthy of Martin Tupper himself; but yet it is a truth, and one freshly illustrated by our author in thorough good faith and unconsciousness. And in wishing him many more readers, we would but advise them not to follow him in his one leading error of confounding the splendid material and fine historic name of which the Royal Regiment should be proud, with the faulty and incomplete organization, in spite of which, not through which, its honours have been won. The traditions of Woolwich on this latter head are as little to be trusted as a blind man's views of colour, so great is the inclination of the knot of placemen who rule there rather "to make the best of what is" (which for them is very good indeed), "than to suggest change and improvement."

MR. O'CONNOR MORRIS tells us in the preface to his sketch of *The French Revolution and First Empire* (Longmans, 1874), that it "was intended to be a number of the 'Epochs of History,' in course of publication." But as the editor of the series considered it suited to readers more advanced in years than those for whom that series is especially designed, it now appears in a separate form.

It is evident that if a sketch such as this is suitable for anybody at all, it must be suitable for boys and girls in the higher forms of schools. No one who wished to study the period deeply would be content with so brief a sketch. The real question therefore at issue would seem to be, not whether the book is fit to be read at the age of fourteen, or the age of twenty, but whether the narrative is so given as to be attractive to those who take an interest in history, though their knowledge may not go very far. On such a point example is better than argument, and we therefore copy Mr. Morris's account of the storming of the Bastille, to serve as a specimen of his power of telling a story:—

"On the verge of the quarter of St. Antoine rose the celebrated fortress of the Bastille; and it was resolved to attack this dreaded place, the very emblem of ancient despotism, and infamous for its mysterious horrors. An armed mass poured down to the spot, and after an ineffectual attempt at a parley, the drawbridge was passed and the inner court reached, close to the eight frowning towers of the hated dungeon.

A discharge of musketry drove the assailants back, but cannon were brought up by the late French guards, and a white flag before long was waved from the ramparts, the commandant, Delaunay, having been compelled by the garrison (alarmed or ill-disposed) to surrender. The victors rushed into the ancient den, amazed at the feat they had accomplished, and carrying out many of the arcana of the place—old instruments of torture and prison records; but their victory was not unstained by cruelty. The greater part, indeed, of the garrison were set free; but Delaunay and several of his men were murdered, and their heads were borne on high on pikes—the first of many subsequent scenes of the kind."

It should be added that Mr. O'Connor Morris evidently wishes to treat all parties impartially, though his impartiality is rather that of the disinterested spectator than that which springs from the wide human sympathy which Mr. Carlyle has taught us to look for when we think of the French Revolution.

History of Booksellers. By H. Curwen. (London: Chatto & Windus.) It is somewhat late to notice Mr. Curwen's *History of Booksellers*, seeing that it was published at the beginning of the year. It belongs, however, to a class of books which are intended to live, or at least to be sold, for more than one season; and, besides, better late than never. Mr. Curwen has produced a useful and interesting compilation. The motto prefixed to it, a dictum by Carlyle that "in these days ten ordinary histories of kings and queens were well exchanged for the tenth part of one good history of booksellers," led us to expect something more ambitious than he has actually attempted. But he has clearly defined his aim in a preface, and perhaps there is no great harm in suggesting that a book with the title of his book, ably done, would be a work of great interest and value. What he has attempted is to bring together as much matter about booksellers as could be put into one volume, "to be issued in a cheap and popular form," and he may fairly be congratulated on the manner in which this task has been performed. Perhaps, instead of claiming for it the dignity of history, he should have described his work as a book about booksellers, or rather as a book about some eminent British members of "the trade;" but it would be hypercritical to insist upon this point. The apology he makes for not having written the life of every eminent bookseller, ancient or modern, is altogether unnecessary. There was no call upon him for a work so comprehensive in scope; and what he has done, besides being easily done, will suit the public much better. What he has done must be briefly described. Beginning at Rome in the time of Augustus, and taking the middle ages in his course, by a happy hop, step and jump he alights upon Jacob Tonson. Very soon he makes his way to the familiar names of Longman, Constable, and Murray, and thereafter his lives are well selected and well written. The book contains some misprints, which should at the first opportunity be corrected, especially as they chiefly occur just where misprints are most misleading—in the dates. Where a date is wrong by a hundred or hundreds of years, there is no great harm done; the error is noticeable; but it is awkward to have errors in the tens. For example, an error of this kind leads to temporary confusion between the great John Murray and his father. The notices given of some of the obscure British publishers are interesting. So also is a chapter on provincial booksellers, though it is not so full as could be wished.

EDITOR.

NOTES AND NEWS.

LORD ACTON has in the press a collection of unpublished journals and diaries kept during the Council of Trent by bishops and officers of the Council.

THE *Nation* announces that Dr. Leonard Bacon's *Genesis of the New England Churches* will be published shortly by Messrs. Harper Brothers.

LORD VERULAM has given permission to the Camden Society to print the judgment delivered in the Ship Money case by Justice Croke, with autograph corrections by the judge.

It is announced that at this year's Oxford Commemoration the degree of D.C.L. *honoris causa* will be conferred on the Right Hon. Sir George Mellish, one of the Lords Justices of Appeal; Major-General Sir Garnet Joseph Wolsley, K.C.B., G.C.M.G.; Sir Thomas Erskine May, K.C.B., Clerk of the House of Commons; and Victor Carus, Professor of Comparative Anatomy and Zoology in the University of Leipzig. Professor Carus is well-known to many members of the University. Some twenty years ago he acted as Dr. Acland's assistant in arranging and cataloguing the anatomical collection, then at Christ Church, now in the University Museum. He was appointed deputy-professor in the University of Edinburgh during the absence of Professor W. Thomson, and is lecturing at the present moment, with great success, at Edinburgh, before a numerous class of students.

MR. FURNIVALL has agreed to give a course of eight lectures on "The English Language and Literature from the Earliest Times to that of Chaucer," to the Ladies' Class at Oxford next October term.

In a poem headed, "To the blessed Saint of famous memory, Elizabeth, the humble petition of her now wretched and contemptible y^e Commons of England," which Mr. Morfill is now editing from an Ashmole MS. for the Ballad Society, the Virgin Queen's spirit is comforted by being assured that

"No snuffling raskall, with his horne-pipe nose,
Shall tell thy story in his ill-tun'd prose."

Other poems in the collection complain grievously of the Scotch plundering of all good English places under James I.

MR. CECIL MONRO is engaged upon an investigation of the Chancery suits with respect to which Lord Bacon was charged with bribery. As the late Registrar of the Court of Chancery, Mr. Monro possesses a professional familiarity with the documents, which contain the evidence which has been wanting to previous inquirers.

ON the subject of Shelley's *Refutation of Deism*, mentioned in our last, Mr. W. M. Rossetti writes that there are only two speakers in this dialogue, Eusebes and Theosophus. Eusebes knows Theosophus to be a Deist, a believer in a God on the basis of natural religion, and he wants to make him a Christian as well. He argues that a God cannot be proved from the evidence of nature, but only from revelation; therefore, a man who is not a Christian has no final refuge save atheism. Theosophus strenuously impugns the religious faith of which the Old and New Testaments are the documents; but, being hard pressed by the reasonings of Eusebes, and extremely alien from atheism, he concludes by promising to reflect whether or not he can accept, and add to his own natural deism, any of those doctrines which are distinctively Christian. Thus the whole tone of the argument is a little sophistical. Shelley gives you to understand that the being of a God, though not proveable from nature, may presumably be proveable from revelation; whereas his real aim is to show that revelation cannot possibly be reconciled with reason, and therefore the being of a God is not proveable at all; atheism being the right alternative to Christianity. Some portions of the *Refutation of Deism* are reproduced *verbatim* from the notes to *Queen Mab* (printed in the previous year, 1813), and other portions bear no distant relation to the same notes.

DR. GREGOROVITUS' recently published work on Lucrezia Borgia has met with such success in Germany that a new edition is already called for, and will appear in the course of the present month. The Cotta firm, which published the *History of Lucrezia Borgia*, is bringing out *The*

Life and Works of Goethe, by Karl Goedeke, a work which from the well-known reputation of the author promises to be of considerable interest, and is of the greater importance from the fact that Goethe has hitherto met with his ablest and most sympathetic biographers among foreigners specially, and not till now, as in the present instance, from compatriots of exceptional attainments.

THE *Atlantic Monthly* for June has a bit of autobiography by Mr. Robert Dale Owen, the scene of which is laid at Naples; a pathetic tale of the Civil War, and a rebel's rather ludicrous recollections of the same; the somewhat too painful Confessions of a Morphine-drinker; and an article devoted to the *cultus* of the Cat. *Lippincott* has some unpublished letters of Coleridge, written from 1816 to 1818, when he was living at Mr. James Gillman's. They are addressed to his publishers, and relate, among other subjects, to the republication of the *Friend*, the publication of *Zapolya*, and Coleridge's share in the projected *Encyclopaedia Metropolitana*. They are full of individual touches, and conclude with some remarks on animal magnetism, a subject which Coleridge was anxious to have fully investigated. The same magazine has an article, with pretty vignettes, on the Schuylkill Valley, near Philadelphia, on which Tom Moore bestowed such a measure of immortality as he could confer; and an interesting account of a visit to a Japanese Bonze in 1871. There does not appear to be much sacerdotalism among the bonzes as a rule, although, says the writer,

"fasting is often practised, and some of the young bonzes look as pale and spiritual as those among our own students of theology who cultivate dyspepsia as a means of grace. Indeed, there is a very pale and handsome, dark-eyed young bonze, who performs the part of warden to the tombs of the taikuns at Uyeno in Yeddo, and acts as cicerone to visitors, of whom one of a party of young missionary ladies that visited the tombs a short time ago naively remarked, 'What a splendid convert he would make!'"

THE General Congress of German Schoolmasters, which has been celebrating the twenty-first anniversary of its establishment, closed its meeting at Breslau on May 29, when it was determined that the Association should next year meet at Augsburg. The publication in the leading German journals of the proceedings has called forth some curious notices of the hereditary nature in certain families of the vocation of teaching. One of the most remarkable of the instances recorded is that of the family Kunzig, three generations of whom have, without a year's break, been employed, from 1723 to the present time, in the educational department of the State-service as schoolmasters. Such devotion to one calling seems to merit a better return than that awarded to the representative of the Kunzigs, who after forty-eight years' labour as a teacher receives only a stipend of 230 thalers annually.

THE autograph letters collected by the late Sir William Tite were sold by Messrs. Sotheby and Co., on Friday, the 5th inst. Among the most interesting and valuable lots offered, we noticed a long letter of Rabelais, in Latin, which fetched 62*l.*; three letters of Edward Gibbon, from 3*l.* to 9*l.* 10*s.*; two letters of Robert Burns, 8*l.* 8*s.* and 7*l.* 12*s.*, and the original MS. of his song "Scots wha hae wi' Wallace bled," 25*l.*; a letter of the Duke of Buckingham, the favourite of James I. and Charles I., 17*l.* 10*s.*; a letter of Lord Byron, speaking of his critics, 18*l.*; a holograph letter of Charles I., addressed to "My only deare sister," and dated from the Palace at Greenwich, 18*l.*; a long letter from Boswell to David Garrick, mentioning Dr. Johnson, 17*l.*; a letter of "Kitty Clive" to "My dear Poppy," 11*l.*; a letter of Lord Bacon, 21*l.*; the initials of Nell Gwyn, scrawled at the foot of a letter dictated by her to an amanuensis as ignorant of spelling as herself, 28*l.*; a letter of the Duke of Wellington to John Wilson Croker, about the battle of Waterloo,

21. 15s.; two letters of William Cowper, 51. 5s. and 71. respectively; an unpublished letter of Voltaire, 51. 5s.; a long letter of Jeremy Taylor on the subject of Irish affairs, 71. 15s.; two letters of Dean Swift, 131. 5s. and 181. 5s.; one of Sir Richard Steele, 51. 15s.; one of Laurence Sterne, 131.; of Robert Southey, 71. 7s.; one, in Italian, of Rubens, 71.; one of Rowlandson, the caricaturist, 71.; two of Dryden, 251. and 171. 10s.; one of Schiller, 171. 10s.; one of Samuel Richardson, 41.; one of Foote, 71. 15s.; one of Matthew Prior, 41. 6s.; one of William Cobbett, 91. 5s.; two of Alexander Pope, 61. 10s. and 111.; one of Lord Nelson, addressed to Lady Hamilton, 51. 5s.; two of S. T. Coleridge, 101. and 121.; a speech of Macaulay, evidently written out for the reporters, 121. 10s.; a letter of David Hume, 181. 10s.; one of Charles Lamb, 141. 5s.; and the original Manuscript of the "Dissertation on Roast Pig," signed "Eliu," 341.; a letter of Oliver Goldsmith to David Garrick, 601. Perhaps the two most remarkable letters in the collection were: a holograph letter of Mary, Queen of England, to her uncle, the Cardinal of Lorraine, which fetched 951.; and a letter of Oliver Cromwell to Sir Edmund Bacon, giving details of some military exploits before Gainsborough, which fetched 1061. The correspondence of General Lord Ligonier with many of the celebrated men and women of the last century was bought for 261. 10s. in one lot. Many of these autographs are said to have been purchased for the foreign market, especially America.

AN oft-told story of "old English spirit and integrity" in a female, runs somewhat in this form. Anne Clifford, countess of Dorset, Pembroke, and Montgomery, possessed, by failure of the main line, the great hereditary estates of the Cliffords, earls of Cumberland, and the consequent patronage of the borough of Appleby. Sir Joseph Williamson, minister and secretary of Charles II., wrote to her ladyship, suggesting a candidate for the borough. She returned the following laconic answer: "I have been bullied by a court, but I will not be dictated to by a subject: your man shan't stand.— ANNE DORSET, PEMBROKE, and MONTGOMERY." This is a very pretty story as it stands, which it seems a pity to spoil by any doubts as to its authenticity. Not being able to trace the source of it, we are unable to give a direct denial of its truth; but we print here a letter, from the undoubted original among the State papers in the Record Office, which passed between the same two persons, and leave it to others to judge of the likelihood of both letters having proceeded from the same hand:—

"Brougham Ca: the 16 of January 1667: 1668:

"S^r

"I received yo^r Letter of the 11th of this month. by the last Post, as alsoe my Cozen Mr John Dalton of Aconbanke, his desyes to mee, to y^e same effect, on yo^r behalfe, that I would employ my Interest att Appleby, to procure yo^r to bee chosen Kyrgeresse there in the place of my Cozen John Lowther lately deceased.

"I should have bin very willinge, S^r, to have done y^e service therein, but that I had a p^r ingagem^t upon mee, both for my owne Grandchildran in y^e Southerne parts, and some of my own Kindred and Freinds in the north. w^{ch} I hope yo^r will take in good part, as a reasonable Apologie for my selfe in this Businesse.

"S^r,

"Your Assured frind

"ANNE PEMBROKE.

"To Mr Secretary Williamsonne att the Cortte att Whitehall del^d this."

THE copyright of Octave Feuillet's famous *Sphinx* has been secured by the *Univers illustré*, and will be published in the columns of that journal.

THE subject of the prize poem of the French Academy for 1875 is "Livingstone."

MELER SIMONOWITSCH, who has been carrying on her medical studies first at Zürich, and afterwards at Bern, has just obtained the degree of

M.D. *summa cum laude* in the latter university, being the first lady student who has ever taken that degree at Bern.

MESSRS. BELL have reprinted in a convenient and portable shape, uniform with the Bohn series, Miss Strickland's *Life of Mary Queen of Scots*, which originally formed part of her well-known work, the *Lives of the Queens of Scotland*. Although it is offered in a condensed form, nothing of importance or interest has been omitted. At the end of the second volume will be found a facsimile of a letter from the Countess of Lennox, the mother of Lord Darnley, to Mary, written in a tone of such affection as would imply that she at least believed in the innocence of the Queen in any participation in her son's death.

It is with great regret that we learn the death of Professor Usinger, which took place on June 1, at Bremen, whither he had gone to take part in the meeting of the Hanseatic History Association. Since the publication of his *Germano-Danish History*, in 1863, and more especially since his appointment, in 1867, to the Chair of History at the University of Kiel, few men—scarcely even Dr. Waitz himself, to whom he looked as his model and master in the art of historical research and composition—have done more than Professor Usinger to enlarge and ennoble the domain of historical inquiry. To him scholars are materially indebted for the system and order which has of late years begun to be established in reference to the arrangement, classification, and elucidation of the public State archives of Germany, while the strong patriotic bias with which, as Secretary of the Historical Society of the Duchies of Schleswig-Holstein and Lauenburg, he conducted the publication of its Transactions, undoubtedly exerted a very powerful influence on the political bearing of the questions of the German nationality of those provinces. His lectures were at once the most profound and the best attended of any at Kiel, and by the death of Professor Usinger the University has lost one of its greatest ornaments, and the students one of the most original and philosophic, as well as the most eloquent, enthusiastic and genial, of their teachers.

M. DE SOUTHEYRAN has been appointed Vice-President of the Historical Monuments Commission in place of the late M. Vitet.

DR. KARL RUDOLF HAGENBACH, the well-known German writer on Church History, died at Bale, June 6th, at the age of 73. His poems enjoyed considerable popularity amongst Germans and Swiss.

THE recently issued yearly report of the Friedrichs-Werdersche Gewerbeschule (Trade School), in Berlin, contains an interesting political sketch of the reign of Richard II., written for the purpose of interpreting the alliterative poem on the deposition of that king, attributed to William Langland. This poem has already been printed three times—twice by Mr. Wright, viz., for the Camden Society, 1838, and in *Political Poems and Songs*, vol. i., p. 368; and again, in 1873, by the Rev. W. W. Skeat, under the title of *Richard the Redeles*, for the Early English Text Society. Dr. Carl Ziepel, the writer of this sketch, appears only to have known the two earlier editions, and would have gained much assistance from Mr. Skeat's excellent edition. With regard to the authorship of the poem, Dr. Ziepel, whilst admitting that there are many points of resemblance between the vision of Piers the Plowman and the poem of Richard, yet finds that "after a careful perusal of the two poems, doubts will arise whether really both can have been written by the same man." The reasons brought forward to warrant these doubts can, however, hardly be considered to be conclusive: the chief one, that the author "nowhere betrays the slightest knowledge of classics, never quotes a Latin phrase, and speaks of clerks as if he did not count himself among their number," is founded on a mistake. There are no fewer than five Latin quotations in Mr.

Skeat's edition of this poem: these were omitted by Mr. Wright, as he considered them as comments inserted by the scribe, and as such did not form part of the text. In his preface to the poem, Mr. Skeat remarks, with reference to these quotations, that "these appeals to Scripture, or to the writings of 'clerks,' are exactly in Langland's usual manner, and the quotations are to be ascribed to the author, and not to the scribe." The sketch of the reign of Richard II. is worked up in a very careful manner, and the old Chronicles supply the author with many interesting facts, which exhibit the diligence with which these materials have been collected. The report is also noteworthy as evidence of the increasing attention paid to the study of English literature in Germany.

NOTES OF TRAVEL.

IN the course of a few weeks, the German Imperial corvette *Gazelle*, under the command of Captain von Schleinitz, will leave Kiel with the staff of astronomers sent by the German Government to observe the transit of Venus (on December 8) on the Kerguelen Islands, in the South Indian Ocean. Another detachment of German observers will at the same time be stationed on the Auckland Islands. In the event of a failure on the part of the former portion of the staff to obtain good observations of the transit, the *Gazelle* will convey them and the other German observers to the Mauritius about the middle of December, and leave them there till the end of January, 1875, when they will enter upon a voyage to the Antarctic Seas with the special object of investigating the polar currents and other phenomena connected with the south-polar region.

THE *Times* quotes a letter from a St. Louis paper, giving an account of extensive ruins, found some miles east of Florence, on the Gila river. The principal is a parallelogram fortification, 600 ft. in width by 1,600 ft. in length. The walls, which were built of stone, have long been thrown down, and are overgrown by trees and vines. In many places the stones have disappeared beneath the surface. Within the enclosed area are the remains of a structure 200 ft. by 260 ft., constructed of roughly-hewn stones. In some places the walls remain almost perfect to a height of some 12 ft. above the surface. On the inner sides of the wall of the supposed palace there are yet perfectly distinct tracings of the image of the sun. There are two towers at the south-east and south-west corners of the great enclosure still standing, one of which is 26 ft. and the other 31 ft. high. These have evidently been much higher. A few copper implements, some small golden ornaments—one being an image of the sun with a perforation in the middle—and some stone utensils, and two rudely-carved stone vases, much like those found at Zupetaro and Copan, in Central America, are all the works of art yet discovered. The ruins are situated in a small plain, elevated nearly 200 ft. above the bed of the Gila. Just west of the walls of the fortification there is a beautiful stream of water having its source in the mountains, which crosses the plain, and by a series of cataracts falls into the Gila about two miles below. The fragments of pottery and polished stone reveal a condition of civilisation among the builders of these ruins analogous to that of the ancient Peruvian, Central American, and Mexican nations. The country in the vicinity is particularly wild and unusually desolate. No clue to the builders of this great fortified palace, with its towers and moat, has been discovered, but it would seem that this whole country was once peopled by a race having a higher grade of civilisation than is found among any of the native tribes of the later ages. But whether this race were the ancestors of the Pimos, or some extinct people, is not known. It is understood that these ruins will be thoroughly explored within the present year.

THE exhibition of Colonial products in Paris will contain an enormous nugget of gold coming

from Cayenne. At the present moment this mass of precious metal, which is in its crude state, is at the Banque de France, and it will be melted down into an ingot one day next week. It weighs 200 kilogrammes, and is worth 600,000 francs. It was sent to Paris by one of the companies working the mines discovered a few years ago in the French colony of Guayana. The quantity of gold won for some time past from these workings has, it is stated, become so considerable, that the project is seriously considered of diverting the waters of the river Oyapoch and its affluents from their present beds, in order to facilitate the extraction of the gold which there is no doubt is concealed there.

ACCORDING to the *Levant Herald* the latest letters from Colonel Gordon are written from Fashoda, a station about midway between Khartoom and Gondokoro, where he arrived on March 29. He was about to proceed the following day, and expected to arrive at Gondokoro on April 6, thus making the journey from Cairo to Gondokoro in six weeks, including eight days' stay at Khartoom, where in his position of Governor of the Upper Nile he had business to transact, including new regulations as to the future trade in ivory. He has been able to travel thus expeditiously, because, through the energy of the Egyptian governor of Khartoom, the obstruction which formerly existed in the river and impeded the passage of boats has been removed, and the Egyptian Government steamers now make the voyage from Khartoom to Gondokoro without difficulty. The *personnel* and *baggage* left Souakim on April 20, so that they are about two months behind the chief of the expedition.

THE same paper states that great distress was caused in Styria by the extreme severity of last winter, and now the crops are threatened with destruction by the incessant rains that have been falling for some time past. From all parts of the province the news is very alarming. Railway traffic has been almost completely stopped. On the southern railway, circulation was interrupted in two places, at Kuidberg, where the water broke down the embankments, and at Leibnitz, where the bridge of Landacha was swept away by the river. On the Bruck-Leoben line traffic became impossible, and on the Rudolphe line circulation was suspended as far as Knittelfeld. On the line of East Hungary, the trains are unable to run further than Feldbach, at which station passengers are conveyed to Fehring in boats. The lines which have suffered most are those of Graz-Köflach and Lieboch-Wies. On these railways the rock cuttings are nearly all under water, and the flood has even invaded the offices of the Company. Even at Graz, the capital of Styria, the suburbs are partially inundated, in spite of the active efforts of the municipality. From Gratvoen to Indendorf the country has been turned into one great lake. Should the rain cease quickly there may be yet a chance of saving part of the crops, but should it continue, the consequences will be most disastrous.

A GALA meeting of the Anthropological Society of Munich was held on May 23, to welcome the President, Professor Zittel, on his safe return from the Libyan desert. The members of the Munich Geographical Society participated with the Anthropologists in doing honour to the enterprising traveller; and in the course of the evening Paul Heyse addressed the meeting, and concluded a genial speech with some spirited lines, in which he drew an amusing parallel between life in Egypt and Bavaria.

A CORRESPONDENT of the *London and China Telegraph*, writing from Kandy (Ceylon), says:—"The changes that have taken place in the matter of coffee cultivation within the last three years are simply marvellous. New districts formerly despised have risen up like magic. Whole country sides of primeval forest have given way to the axe of the cultivator, and districts whose only

inhabitants were the elephant, the chetah and the elk, are now flourishing plantations of coffee." The writer observes that the leaf disease, for which no cure has been discovered, has been very troublesome. "It is a fungus that attaches itself like a miniature mushroom to the lower side of the leaf of the coffee tree, and appears to extract its vitality, for the leaf withers and dies. It has now been among us for four years, and has done an incalculable amount of mischief." The long drought, which has had such a disastrous effect in India, has also unfavourably affected the Ceylon coffee crop this year.

WE learn from Dr. Zittel's letters to the *Augsburg Gazette*, that the charts now being constructed from the results yielded by Dr. Kohlfs' expedition, will enrich geographical science by the acquisition of sixty corrected determinations of latitude, and twelve of longitude, for that section of the Libyan desert which is under the dominion of Egypt as far as the parallel of Chazhe, and for a considerable part of the neighbouring still unannexed desert. M. Remelâ, who took upwards of 200 photographic views of places in the course of the expedition, was fortunate enough to secure admirable pictures of the ancient temples of Dachel and Chazhe, which will throw considerable light on the archaeological history of these buildings. Among other objects of interest M. Remelâ discovered in the *débris* of the ruined temple at Dachel some splendidly preserved carvings, and plates inscribed with hieroglyphic characters, which, when deciphered by Professor Brugsch, were pronounced by that competent authority to be the ancient Egyptian name of Dachel. Some of the royal rings found in the temple of Chazhe were engraved with unknown names, and were believed to belong to the time of the Roman emperors, to which period the building of the temple is probably, therefore, also to be referred.

It is a matter of congratulation for all who propose attending the Archaeological Congress, to be held at Stockholm in the month of August, that a new, short and rapid route has been opened between Altona (Hamburg) and Gottenburg, by which the entire journey may be accomplished in twenty-five hours, with only four and a half hours' sea passage. This is a saving of nearly twelve hours on the old route, and the directors of the Royal Danish State Railway Company deserve the gratitude of travellers for the enterprise and efficiency with which they have organised this better route, and secured for the success of its permanent establishment the co-operation of the Postmaster General of Sweden.

ACCORDING to the latest accounts from Yokohama, the Japanese Government will proceed without delay to chastise the barbarian natives of the island of Formosa, for their massacre of some Lutschu islanders, and to take steps for the colonisation of the southern and most fruitful parts of the island. The possession of this region would be very important to the Japanese, as the country is densely covered with woods of the camphor tree, and is well supplied with coal-beds. The expedition is to consist of the best ships of the Japanese fleet and a force of 3,000 men. The Chinese, not to be outdone by Japanese enterprise, have built themselves several ironclads and ships of war, of which they are exceedingly proud, and which they intend to exhibit to the eyes of Europeans and Americans. Arrangements have already been made to despatch one or two of these newly-launched vessels to the Western World to astonish the barbarians and strike terror into their breasts, while they at the same time perform the peaceful mission of conveying Chinese goods to America, for the Great Exhibition to be held at Philadelphia in 1876.

THE French colonial products lately in the Vienna Exhibition have been placed with those of Algeria in a wing of the Palais d'Industrie, and a report on them has just been issued by the

Marine and Colonial Office. From a perusal of this publication, it appears that sugar, cocoa, coffee, vanilla, ebony, sandal-wood, and gums, rank among the chief exports. Particular attention has been paid to the production of vanilla in the island of Réunion, and since the exhibition of 1867 the price has risen from 32 to 200 francs per kilogramme. Black tea also bids fair to thrive there, as some specimens sent by M. de Chateauvieux, a proprietor in the island, to the Vienna Exhibition, were ranked as equal to the finer sorts of Chinese. Ebony, which fetches no less than 250 francs per cubic metre, abounds in some of the French colonies; and a substitute for boxwood for engraving purposes, which is getting scarcer and scarcer every day, has, it is said, been just discovered. These and other products will find a place in the forthcoming exhibition of foreign produce which will be held in connexion with the approaching Paris Geographical Congress.

A LETTER OF LAURENCE STERNE.

IN the short autobiography which Sterne left behind him, he says that at the time of his marriage his uncle Jaques and himself were upon very good terms, "for he soon got me the prebendary of York, but he quarrelled with me afterwards, because I would not write paragraphs in the newspapers; though he was a party man, I was not, and detested such dirty work, thinking it beneath me. From that period he became my bitterest enemy." The events of Sterne's life previous to his emerging to fame in 1759 with his first two volumes of *Tristram Shandy*, are little known, and the researches of Mr. Percy Fitzgerald for the biography of Sterne which he published about ten years ago, threw but little light upon the circumstances which helped to form the character of such an eccentric writer. It is therefore, important to record that among the autograph letters recently purchased by the Trustees of the British Museum are two, written by Laurence Sterne and his uncle respectively in 1750, which have considerable literary and biographical value. We believe that this letter is the only Sterne autograph in the possession of the Museum, with the exception of the original manuscript of *The Sentimental Journey*, and it has been therefore most appropriately placed in one of the public rooms for inspection. Thanks to the courtesy of the keepers of the MS. Department, we have been allowed to make a complete transcript of it, which we print here at length. The Rev. Francis Blackburne, to whom it is addressed, will perhaps be remembered as the author of the *Confessional*, which raised a considerable ferment in its day.

"Sutton: Nov. 3, 1750.

"Dear Sir,—

"Being last Thursday at York to preach the Dean's turn, Hilyard the Bookseller who had spoke to me last week about Preaching y^e, in case you should not come y^eself told me, He had just got a Letter from you directing him to get it supplied—But with an intimation, that if I undertook it, that it might not disoblige your Friend the Precentor. If my Doing it for you in any way could possibly have endangered that, my Reg^d to you on all accounts is such, that you may depend upon it, no consideration whatever would have made me offer my service, nor would I upon any Invitation have accepted it. Had you incautiously press'd it upon me; And therefore that my undertaking it at all, upon Hilyard's telling me he should want a Preacher, was from a knowledge, that as it could not in Reason, so it would not in Fact, give the least Handle to what you apprehended. I would not say this from bare conjecture, but known Instances, having preach'd for so many of Dr. Sterne's most Intimate Friends since our Quarrel without their feeling the least marks or most Distant Intimation, that he took it unkindly. In which you will the reader believe me, from the following convincing Proof, that I have preach'd the 29th of May, the Precentor's own turn, for these two last years together (not at his Request, for we are not upon such terms) But at the Request of Mr. Berdmore whom he desired to get them taken care of, which he did, By applying Directly to

me without the least Apprehension or scruple—And If my preaching it the first year had been taken amiss, I am morally certain that Mr. Berdmore who is of a gentle and pacific Temper would not have ventured to have ask'd me to preach it for him the 2^d time, which I did without any Reserve this last summer. The Contest between us, no Doubt, has been sharp, But has not been made more so, by bringing our mutual Friends into it, who, in all things, (except Inviting us to the same Dinner) have generally bore themselves towards us, as if this Misfortune had never happend, and this, as on my side, so I am willing to suppose on his, without any alteration of our opinions of them, unless to their Honor and Advantage. I thought it my Duty to let you know, How this matter stood, to free you of any unnecessary Pain, which my preaching for you might occasion upon this score, since upon all others, I flatter myself you would be pleased, as in gen^l, it is not only more for the credit of the church, But of the Prebend^r himself who is absent, to have his Place supplied by a Preb^r of the church when he can be had, rather than by Another, tho' of equal merit.

"I told you above, that I had had a conference with Hilyard upon this subject, and indeed should have said to him, most of what I have said to you. But that the Insufferableness of his Behaviour (*sic*) put it out of my Power. The Dialogue between us had something singular in it, and I think I cannot better make you amends for this irksome Letter, than by giving you a particular Acc^t of it and the manner I found myself obliged to treat him wh^{ch} By the by, I should have done with still more Roughness But that he sheltered himself under the character of y^r Plenipo: How far His Excellency exceeded his Instructions you will perceive (*sic*) I know, from the acc^t I have given of the Hint in your Letter, wh^{ch} was all the Foundation for what pass'd. I step'd into his shop, just after sermon on *All Saints*, when with an Air of much Gravity and Importance, he beckon'd me to follow him into an inner Room; No sooner had he shut the Dore (*sic*), But with the awful solemnity of a Premier who held a Letter de Châchét upon whose contents my Life or Liberty depended—after a minuits Pause,—He thus opens his Commission. Sir—My Friend the A. Deacon of Cleveland not caring to preach his turn, as I conjectured, has left me to provide a Preacher,—But before I can take any steps in it with Regard to you—I want first to know, Sir, upon what Footing you and Dr. Sterne are?—Upon what Footing!—Yes, Sir, how your Quarrel stands?—Whats that to you?—How our Quarrel stands! Whats that to you, you Puppy? But, Sir, Mr. Blackburn would know— Whats that to him?—But, Sir, dont be angry, I only want to know of you, whether Dr. Sterne will not be displeased in case you should preach—Go look; I've just now been preaching and you could not have fitter opportunity to be satisfied.—I hope, Mr. Sterne, you are not angry. Yes, I am; But much more astonished at your *Impudence*. I know not whether the Chancellors stepping in at this Instant and flapping to the Dore, Did not save his tender soul the Pain of the last word; However that be, he retreats upon this unexpected Rebuff takes the Chancell^r aside, asks his Advice, comes back submissive, begs Quarter, tells me Dr. Hering had quite satisfied him as to the Grounds of his scruple (tho' not of his Folly) and therefore beseeches me to let the matter pass, and to preach the turn. When I—as Percy complains in Harry y^e 4—

... All smarting with my wounds
To be thus pester'd by a Popinjay,
Out of my Grief and my Impatience
Answer'd negligently, I know not what
... for he made me mad
To see him shine so bright & smell so sweet
& talk so like a waiting Gentlewoman

—Bid him be gone & seek Another fitter for his turn. But as I was too angry to have the perfect Faculty of recollecting Poetry, however pat to my case, so I was forced to tell him in plain Prose tho' somewhat elevated—That I would not preach, & that he might get a Parson where he could find one. But upon Reflection, that Don John had certainly exceeded his Instructions, and finding it to be just so, as I suspected—there being nothing in y^r letter but a cautious hint—And being moreover satisfied in my mind, from this and twenty other Instances of the same kind, that this Impertinence of his like many others, had issued not so much from his Heart, as from his Head, the Defects of which no one in reason is accountable for, I thought I sh^d wrong myself to remember it, and therefore I parted friends, and told him I would take care of the turn, wh^{ch} I shall do with Pleasure.

"It is time to beg pardon of you for troubling you with so long a letter upon so little a subject—which as it has proceeded from the motive I have told you, of ridding you of uneasiness, together with a mixture of Ambition not to lose either the Good Opinion, or the outward marks of it, from any man of worth and character, till I have done something to forfeit them, I know your Justice will excuse.

"I am, Rev^d Sir, with true Esteem and Regard, of wh^{ch} I beg you'll consider this Letter as a Testimony,

"Y^r faithful & most aff^d

"Humble Serv^t

"LAU: STERNE.

"P.S.

"Our Dean arrives here on Saturday. My wife sends her Resp^t to you & y^r Lady.

"I have broke open this letter, to tell you, that as I was going with it to the Post, I encountered Hilyard, who desired me in the most pressing manner, not to let this affair transpire—and that you might by no means be made acquainted with it—I therefore beg, you will never let him feel the effects of it, or even let him know you know ought about it—for I half promised him,—tho' as the letter was wrote, I could but send it for your own use—so beg it may not hurt him by any ill Impression, as he has convinced it proceeded only from lack of Judgm^t.

"To

"The Reverend Mr. Blackburn

"Arch-Deacon of Cleveland

"Richmond."

We note that Hilyard did not live to see Sterne achieve his great success, for the first two volumes of *Tristram Shandy* were "Printed for and sold by John Hinxham (successor to the late Mr. Hilyard), Bookseller in Stonegate," York.

The other letter we have mentioned, written by Dr. Jaques Sterne, begins thus:—

"Decem. 6 : 1750.

"Good Mr. Archdeacon

"I will beg leave to rely upon your Pardon for taking the Liberty I do with you in relation to your Turns of preaching in the Minster. What occasions it is, Mr. Hilyard's employing the last time the Only person unacceptable to me in the whole Church, an ungrateful & unworthy nephew of my own, the Vicar of Sutton; and I should be much oblig'd to you, if you would please either to appoint any person yourself, or leave it to your Register to appoint one when you are not here. If any of my turns would suit you better than your own, I would change with you." . . .

Endorsed—

"Mr. Jaques Sterne—reprobation of his nephew Yorick—& mention of the Popish nunnery at York."

PARIS LETTER.

Paris : June 8, 1874.

THERE are forty intelligent Frenchmen who envy the National Assembly. The fact may appear incredible at first sight, but it has been amply and painfully demonstrated. Forty representatives of French literature yearn for the notoriety of the French Parliament, cast longing glances at Versailles, pant for the privilege of creating "incidents," addressing interpellations, vituperating publicly, drowning dear colleagues' voices with a clatter of paper-knives. They have indulged in a very successful parody of the peculiar parliamentarism in vogue at Versailles. The occasion of this masquerade has already been mentioned in these columns. A M. Emile Blavet, whose prose is prized in the *Gaulois*, discovered, in a fortunate moment for his fame, that the lists of the Société des Gens de Lettres contained four execrable names—four symbols of revolutionism, communism, socialism, incendiarism—all those barbarous verbal shafts which political neologists are accustomed to forge for the punishment of an adversary. MM. Pyat, Grousset, Vallès, and Razoua were the members denounced as unclean. The Société des Gens de Lettres was deaf at first, but M. Blavet persisted. He organised a crusade

of conservative paladins, a chorus of orthodox clamourers. Still the Société held its ground, even when M. de Broglie's ministry withdrew its subsidy of 12,000 francs. But the conservative enthusiast hinted at the possible secession of thirty members, and then the Association capitulated. A disciplinary jury was elected by ballot, and the accused members were formally put upon their trial. "Formally" but feebly characterises the wonderful pomp of the literary court. There was a bar, a tribune, president, reporters, advocates, and ushers. But parliamentary forms were invariably adopted. M. Léo Lespès (Timothée Trimm, of the *Petit Journal*) paraded the hall before the trial, offering eau de Cologne, which, as he humorously declared, was to dispel the odour of petroleum. This was merely a jocose preliminary manifestation of party spite. The jury was composed of seven members of the committee, and seven of the thirty-six jurymen first elected by ballot. Among the jury were six novelists, two dramatic authors, and two journalists. M. Emile Blavet prosecuted; Timothée Trimm defended Félix Pyat, and Tony Revillon Vallès, Grousset, and Razoua. The bitterness of the recriminations exchanged by these gentlemen is scarcely conceivable by English minds. M. Alfred Assolant had not attended, and a Bonapartist immediately rose to propose that the Radical novelist should be fined. Jurymen on each side were objected to, and when it is added that three of the members thus erased were reporting the meeting for different journals, it will be easily imagined that the published accounts of the trial are not remarkable for accuracy or moderation. M. Blavet's speech was an essay on the Code Napoléon, tending to prove that a deprivation of civic rights entails exclusion from all legally constituted associations; M. Léo Lespès' defence was merely a string of anecdotes and good-humoured pleasantries in favour of Félix Pyat; M. Revillon trenched somewhat on the domain of politics, and took occasion to inform the Society that M. Emile Blavet, the prosecutor, had, on the morning of September 4, thrown himself into Razoua's arms, and cried "Vive la République!" Then there was a question as to the relative worth of Bonapartists' and Radicals' *paroles d'honneur*, an exchange of piquant personal criticisms between the prosecution and the defence; and the jury retired, to reappear in half an hour, declaring that by a majority of eight to six Félix Pyat and Paschal Grousset were maintained members of the Société; and by a majority of ten to four, and nine to five, Jules Vallès and Razoua were expelled. This curious verdict was succinctly explained by one of the members not elected to the jury: "Pyat is illustrious; Grousset, harmless; Vallès, dangerous; Razoua, nobody."

This manifestation of political rancour is not more ludicrous than a recently advertised project of literary philanthropy. Starting from the unsubstantial stand-point that intellect is a malady that unfits the possessor for all the more prosaic duties of life—that the pen which produces sonnets cannot solve a sum in multiplication—a number of benevolent persons interested in the profession of letters have conceived the idea of instituting a species of literary and artistic asylum or *maison de santé*. Of course the ubiquitous M. de Villemessant is among the philanthropists. He originated the idea. He planned a country house, to be erected in one of

the beautiful valleys of the environs of Paris, at Enghien or Chaton. It is to be called the Villa Soleil. There the worn-out bookseller's hack shall find repose, health, luxury, freedom from work and creditors; there the poet whom absinthe has poisoned shall find a bath of nature ready for him; there the *chroniqueur* shall shake off the fever of Paris life, the political "leader" writer forget the Fusion of the Centres and the fate of universal suffrage. The Villa Soleil will receive whoever lives by his pen or brush. The rich will pay: the poor be lodged and maintained by means of a common fund, formed by voluntary subscriptions, by the offerings of painters and sculptors, the sale of charitable authors' works, lotteries, dramatic benefits, &c. Two well-known doctors will direct the establishment and watch over the inmates—it will be at the same time a hotel, a hospital, a country house, an almshouse, and a club—that is to say, if it exists. As yet the literary refuge is only one of M. de Villemessant's most fantastic projects for the regeneration of the *gent écrivainière*.

M. Dumas will never inhabit the Villa Soleil, albeit he is constantly in search of sun and air and liberty. The dramatist is driven two or three times a year from the Avenue de Wagram to his Norman retreat at Puits, near Dieppe; then, again, from Normandy to Paris. His persecutors are aspiring *collaborateurs*: writers who forward the manuscripts of dramas, comedies, vaudevilles, and even, it is said, pantomimes, for his inspection, for his adoption. *Collaboration* is another royal road to the footlights. M. Dumas has but to write "Oui" on a sheet of note-paper, and that monosyllable is an open sesame, before which every stage door in Paris revolves on its hinges. M. Dumas "est de la pièce"—the technical declaration suffices for the most sagacious manager. It is of no importance that the *collaborateur* thus announced has not amended by one word, has never read the piece he signs; his name will figure on the playbills, he will draw his half of the *droits d'auteur*. In the case of M. Dumas, however, the *collaborateur* hunters never succeed. M. Dumas has made it a rule not to collaborate with any author, known or unknown. He has refused to enter into partnership with his father. His one essay at collaboration (*Le Supplice d'une Femme*) was not encouraging: it resulted in the most violent literary quarrel of the Second Empire. Therefore, last week, M. Dumas left Paris for Puits to prepare his "discours de réception" for November.

George Sand's new novel is unquestionably better than the last five or six volumes she has produced in such rapid succession. *Ma Sœur Jeanne* is almost a revival, a new birth of fervour and fancy. It is romantic and familiar, homely and passionate—it resumes the George Sand of several eras—and it deals with characters that only George Sand could imagine. Laurent and Jeanne are the idyllic children-lovers of her early works, the sober English suitor *Sir Brudnell* is cleverly drawn; but the supreme original character of the book is Manuelita, the woman-child, passionate, simple and pure, a strange and fascinating compound of Mignon and Manon. And in our view, George Sand has improved on Goethe and Leprévost: Mignon-Manon marries a positivist doctor and ends *en bourgeoisie* by rearing a nursery full of children. EVELYN JERROLD.

CORRESPONDENCE.

UNIVERSITY REFORM IN DUBLIN.

Trinity College, Dublin: June 6, 1874.

WILL you permit me, as the mover of the resolution in favour of a single governing body for Dublin University and College, to correct some misapprehensions which the very one-sided account of the proceedings of the Senate in your columns of last week may give rise to? My motion did not involve any censure or vote of want of confidence in the Board. I had already expressed my willingness to give every member of the Board a seat on the new governing body. My seconder, Dr. Stubbs, had given notice of an amendment to that effect. How I can be made responsible for the sentiments of Dr. Reichel, who voted *against* my resolution, passes my comprehension. In my opinion, a scheme for the enlargement and improvement of the existing Board is a far more conservative scheme than one for setting up a new co-ordinate governing body, and separating the College and University, which have hitherto been united. The advocates of violent measures of reform evidently entertained this view, for they all (or almost all) voted against me. Mr. Butt's whole following, Dr. M'Ivor, Dr. Moreland, Dr. Reichel, Sir Richard M'Donnell, and Mr. Johnstone Stoney, voted *non placet* to my resolution; while Dr. Stubbs, the warmest panegyrist of the Board, voted *placet*. For my own part, feeling that we were providing for the future, and not merely for present exigencies, I considered praise and dispraise of the present Board equally irrelevant to the issue. As to its having transpired on Tuesday, before the meeting of the Senate, that my motion was intended as a vote of want of confidence in the Board, I never heard anything of it until I read it in your columns. In fact, we had no organisation, and each of the sixteen who voted *placet* did so for his own reasons, without any previous concert. This was not the case with the *non placets*. There was a private meeting of the Fellows and Professors at one o'clock on Tuesday (the meeting of the Senate being fixed for two), at which there was a great diversity of opinion as to whether my resolution should or should not be adopted. The majority was found to be adverse to it, and a resolution was then taken that the Fellows and

Professors should vote in a mass against it, as the appearance of a division in their ranks might cause the Government to hesitate in accepting the scheme adopted by the Senate. But for this decision I have strong reason to believe that the majority against my resolution, instead of being seventy-four to sixteen, would not have exceeded fifty to forty. In fact, I am not certain that the *non placets* would have been in a majority at all, for many of the outsiders were influenced in their votes by the apparent unanimity of the interns.

W. H. S. MONCK.

DR. R. MORRIS AND DR. WEYMOUTH.

MILL HILL School: June 2, 1874.

I have read with considerable surprise the letter of my friend, Dr. Morris, which appeared in the ACADEMY for Saturday last. One would scarcely gather from it that of the various useful books to which the student is referred in my *Answers to Questions on the English Language*, Dr. Morris's *Accidence* is more frequently commended than any other; for such is the fact. But high as is my appreciation of that work, and far as I have been from entertaining any "anxiety to show that" its author has "gone astray," I do not give him credit for omniscience, nor is it reasonable that my dissenting in a very few instances—as I do decidedly dissent—from the opinions which he has expressed, or the classification or nomenclature he has adopted, and my pointing out one or two apparent omissions, should have evoked such a querulous epistle.

It is amusing to find that Dr. Morris, "in his anxiety to show that I have gone astray," condemns in his fourth paragraph my over-strong expression about *dyde*, as being "perfectly regular"—and I admit it was too strong—and in his fifth paragraph, immediately below, declares the O. E. (that is, Anglo-Saxon) *fōn* and *fēng* to be "exactly analogous" to *do* and *dyde*, whereas *dyde*, according to his view, is reduplicate, which *fēng* is not, and *fēng* is a strong preterite, *dyde* a weak one.

Indeed, it is the weakness of the preterite *dyde* that furnishes one of the chief arguments against the view that Dr. Morris has adopted. And is this argument really so contemptible that it was not worth his while to answer it? Dr. Morris asserts that *-de* as the preterite termination is derived from *did*. To which I object thus: if *-de* = (*did*, or rather) *dyde*, which is itself the weak preterite of *do*, how can it be denied that *dy-de* = *do* + *dy-de*, which again = *do* + *do* + *dy-de* which = *do* + *do* + *do* + *dy-de*, and so on *ad infinitum* and *ad absurdissimum*? And is not this the most curious case of parthenogenesis the philological universe has yet produced?

As to my being "far too positive and dogmatic" in writing "it cannot be admitted that *-de* or *-ed* = *did*," would it not have been more candid to say that these were the closing words after a page and a half of what at least professed to be reasoning? There is no dogmatism in a mere Q.E.D. winding up an argument. As to *roof* from *weave*, one would suppose it obvious that while I clearly laid down a sound principle on p. 52, I was led by a feeling of courtesy to answer the question as it is answered on p. 50, in deference to the intention of the examiners. (The inaccuracy on which I remarked is not, it will be observed, charged on the examiners, but on some, not to say most text-books.)

But I must notice some of the "grave blunders" into which I have fallen.

First, I have confounded the Sanskrit *dā* with *dāhā*, and "mere tyros in philology know that this is wrong." I am not a professed Sanskrit scholar, for "non omnia possumus omnes;" but, at least to a small extent, I have studied the language for myself, and I find that Wilson gives to *dāhā* the meaning of "have or hold," which is remote enough from *ῥιθυμι*. And if Wilson misled me, as other authorities seem to show, this does not affect the argument from reduplication, since *dā*

has a reduplicate second preterite, *dadau*, no less than *dā, dadau*. The sense is equally inappropriate in either case.

And I have compared *do* "with the Gothic weak verb *tanjan* [sic]." I do follow Mr. Skeat in connecting it, like the German *thun*, Du. *doen*, with the M.G. *tanjan*, pret. *tawida*, being fully satisfied that Mr. Skeat is right.

But I have been "violating at the very outset Grimm's law." Are there then no exceptions to Grimm's law? What of *path*, good, gay, grave, hare, freeze, lick (*λίσσω*), star? (Grimm's law "imperat aut servit" (like many other principles), but it is a better servant than master.

To my identification of the *d* or *t* of the past tense with that of the past participle Dr. Morris objects that *d* or *t* as a suffix of the past tense does not exist in Sanskrit, Greek, or Latin. As well might it be objected to plurals in *n* or *r* in the Teutonic and Scandinavian languages, that such plurals are not met with in Sanskrit, Greek, or Latin. But in fact the *d* or *t*, to which I assign a phonetic origin, undergoes modifications: it becomes *n* in the participles of strong verbs, and *th* in the Greek first aorist passive. The modification also of *t* or *d* into *s* is surely familiar enough; and thus I find that the suffix in question *does* exist in *ελυσ-α*, *scrip-s-i*, and the third preterite in Sanskrit, to which *s* again the *κ* of *ἔδωκα*, *ἔθηκα*, *ἔκα* and the majority of Greek perfects active, is apparently allied.

To pass on. "Can *grateful* be a word of 'purely English origin'?" Undoubtedly the word *as a whole* is of English origin, but not *purely* English; yet not the most ignorant youth who tries to scrape through the examination could fail to know whence the first syllable comes. I might, indeed, have written here a note on hybridism, but had what seemed to me sufficient reasons for omitting it; and I may suggest to Dr. Morris, who tells me again and again what I ought to have done, and what I ought not, that on such points every man who writes a book must be allowed to carry out his own plan in his own way.

"Are *king* and *queen* of different roots?" Certainly, so far as the English language alone is concerned. Who would contend that *queen* is derived from *king* as *rājini* from *rāj*, or *Königin* from *König*? Whether they both contain a root (*k-n* or *g-n*) which prevails largely in the Aryan languages is quite a different question, and totally *ab re*; for the question under discussion is the meaning of the term *gender*, not the remoter derivation of the words cited as examples.

I am wrong also in deriving *ditch* (through *dike* or *dic*), *road*, and *doom*, from *dig*, *ride*, and *deem*—I meant of course from the *oldest forms* of those verbs: "the very reverse is the truth:" the derivation has been in the other direction. No doubt also *νίψω*, *τρίπω*, *τριβω* are derived from *νίμω*, *τρίπω*, *τριβή*! and all the Hebraists—but I fancy the shudder that seizes them before even the sentence is finished! I venture to think that though our English names of visible and tangible objects cannot be all referred, as in Hebrew, not to say in Sanskrit too, to verbal roots, verbs significant of action are as a rule roots.

As to the weak contracted verbs: Dr. Morris is evidently right in taking *shut* from *scytan*; but this verb is not given by Grein, and Bosworth assigns it a somewhat different meaning; Wedgwood also overlooks it. As to *spread* and *shred*, we have not the facts before us, for who will affirm that the whole of the A.S. language is preserved in the extant literature? But *rid* seems to me to be clearly in form from the simple *hreddan*, though in sense from the compound *ā-hreddan*, the prefix being discarded. Dr. Morris, indeed, says: "The contract verbs are arranged historically, and I hope scientifically, in the Appendix to my *Accidence*, pp. 308-313." But, strange to say, not one of these verbs *rid*, *shut*, *shred*, *spread*, *sweat*, *let* (= hinder), is mentioned on those pages. I do

not say this to "accuse" Dr. Morris of any special ignorance or negligence. That his book is so complete as it is, is a marvel; but it is precisely my unfeigned respect for him as an English scholar that makes me desirous to free him from his own hand greater completeness still.

In reference to my "peculiar notions about Early English pronunciation," I would remind Dr. Morris that those men are not quite worthless in the world who investigate for themselves instead of taking every thing on trust from others, and truth is often found on the side of a small minority, yes, even of a minority of originally only one. And it will be quite soon enough to adopt this contemptuous tone when the important, indisputable, and very numerous facts which I allege against all the main points in Mr. Ellis's scheme of pronunciation, and which I am firmly persuaded completely upset it, have been shown to be not inconsistent with it; in other words, when I have been *proved* to be wrong.

I am sorry to have done Dr. Morris an injustice in having overlooked his p. 105 at top. It was a pure oversight. Any thought of depreciating the book was most remote from my mind. My hope was that those few strictures, by no means unkindly meant, on a truly valuable book, might lead to the correction of errors and the supplementing of defects in a future edition, which it is sure to reach. Surely in philology, as in other sciences, men who are honestly seeking truth will recognise the fact that all err here and there; none are infallible. And it is sad if members of the great community and brotherhood of learning cannot co-operate heartily in their common high endeavour, without selfishness and jealousy.

R. F. WEYMOUTH.

THE PHOENICIANS IN BRAZIL.

Strassburg: May 28, 1874.

SINCE the land of Moab, possibly also Jerusalem, has shown itself a little untrustworthy as regards the discovery of old-Semitic epigraphs, the "authors" of Phoenician inscriptions have fixed upon quite a remote and remarkable country, nothing less, in fact, than the Empire of Brazil. The Rio de Janeiro paper, *O Novo Mundo*, for April 23, 1874, gives the facsimile of a Phoenician inscription, which is said to have been found on a stone on the property of a certain Sr. Costa, of Parahyba, as had already been announced to the world in the June of the past year. The Director of the Museu Nacional do Brazil, Dr. Ladisláu Netto, had at that time received a copy, or perhaps a squeeze, of the inscription from a young man with whom he was unacquainted; but he was unable to learn anything further either of Sr. Costa himself, or of the exact locality of Parahyba, a not uncommon name in Brazil. The original copy is to be found in the secretary's office of the Historical Institute of Brazil. The editor of the paper (and, with some apology, even Dr. L. Netto), though they express their doubts of the authenticity of the inscription, yet give the "facsimile" with a translation. For curiosity's sake we subjoin a transcription of it in Hebrew characters:—

1. נחן אבן כנענם צדנם הקרת המלך סחר השלך.
2. נא אן אי זרחק ארץ הרם ונשת בחבן עליונם.
3. ועליונת בשנת השעת ושעת לחרם מלכנא אבר.
4. ונהלך מעצון נבר ים סף וננסע עם אניה עשרת.
5. ונהיה בים יחד שחם שנם סבב לארץ לחם ונברל.
6. מיר בעל ולא נהאת חברנא ונבא הלם שנם עשר.
7. מתם ושלש נשם באי חרת אש אנכי מתעשרת.
8. אבך חבלתיא עליונם ועליונת יחננא.

These eight lines are put in the mouths of a dispersed party of Phoenician seamen who had taken part in a voyage round Africa and the world; and the Portuguese translation explains them as follows:—

1. "Canaanites, Sidonians, who set out from the royal city to trade, have erected this stone

2. without me (?) on this distant, hilly, and unfruitful shore, chosen by the gods (and)

3. goddesses in the nineteenth year of Hiram our mighty king.

4. And they set out from Ezion-geber in the Reed (sic) Sea, and embarked their people in ten ships,

5. and were together on the sea two years (coasting) round Africa (Hām); then were they separated

6. from their captains, and parted from their companions; and there put in here twice ten (or twelve)

7. men and three women, on this unknown coast, which I, the servant of the mighty Astarte (Metuashoret sic!)

8. took possession of. May the gods and goddesses pity me!"

There is little difficulty in unmasking so clumsy a forgery as this. Apart from the fact that the genuine Phoenician "cachet" is wanting in the letters (which can always be put down to the account of an inaccurate or unskilful copyist), there occur such gross violations of the elementary rules of all Semitic grammar and lexicography, more especially Phoenician, as could easily have been avoided by the use of a Hebrew grammar for schools. Thus, in line 7, "men" ought to be rendered in Phoenician by *אִישׁ*, not *מתם* (see Carthag. No. 195). The three women who follow should be of the feminine gender, and we ought therefore to have *נשים* *שלש*, &c. The *alonim walonuth* ("gods-and goddesses") of Plautus, which is introduced in lines 2, 3, and 8, ought, of course, to be written *אלנם ואלנת*, not

עליונם, as the "author" of the inscription might have convinced himself with a very little trouble. Indeed it is far from improbable that the unlucky fellow has regulated his lexicon by the ear, and handled his grammar mechanically; and so, as he was told that "to erect" was *hekhin* in Hebrew, the defective *הקן* is taken for *הקנ*, a reference to a table of the Hebrew verbs giving him the first instead of the third person plural at the end of the imperfect (according to the occidental arrangement in a Semitic grammar), he got hold of *הקן*. In this way we can explain how the third person plural of the imperfect is throughout furnished with a *nun* instead of *yod* (e.g. line 4, *ננסע*, נהלך; line 5, *נהיה*, נברל; line 6, *נבא*). We may add the historical improbability, that in the time of King Hiram any Phoenician should have thought it necessary to erect a diplomatic proof in stone of his having taken possession in his own person of a district discovered by himself. DR. S. EUTING.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, June 13,	1 p.m.	Sale at Christie's of the Pictures of the late E. L. S. Benson, Esq.
	3 p.m.	Crystal Palace Fifth Summer Concert (Italian Music).
	"	Mdme. Essipoff's Second Recital (St. James's Hall).
MONDAY, June 15,	2.45 p.m.	Royal Botanic.
	2 p.m.	Mr. Kuhle's Concert (Floral Hall).
	8 p.m.	British Architects.
TUESDAY, June 16,	"	Philharmonic Concert (St. James's Hall).
	8.30 p.m.	Geographical.
	7.45 p.m.	Statistical.
WEDNESDAY, June 17,	8 p.m.	Anthropological: Mr. C. F. Amery on "Reason and Instinct."
	8.30 p.m.	Zoological.
	1 p.m.	Royal Horticultural.
THURSDAY, June 18,	"	Sale at Sotheby's of the Letron Collection of Antique and Modern Engraved Gems.
	7 p.m.	Meteorological.
	8 p.m.	Mr. W. Carter's Choir, Royal Albert Hall.
	4 p.m.	Zoological.
	6 p.m.	Philosophical Club.
	7 p.m.	Numismatic: Anniversary.
	8 p.m.	Linnean.
	"	Chemical.

8.30 p.m. Royal. Antiquaries.
 FRIDAY, June 13, 3 p.m. Hallé's Seventh Recital (St. James's Hall).
 " Duvernoy's Second Recital (Hanover Square Rooms). Handel Festival (Crystal Palace) Rehearsal.
 8 p.m. Philological: Professor J. B. Mayor on "Dr. Guest and Dr. Abbot on English Metre."

SCIENCE.

PESCHEL'S ETHNOLOGY.

Völkerkunde. Von Oscar Peschel. (Leipzig: Duncker & Humblot, 1874.)

It appears from the author's Preface that he would not have thought of composing a handbook of Ethnology, had he not undertaken, in 1869, to re-edit General von Roon's *Völkerkunde als Propädeutik der politischen Geographie*. The new edition was to be published under the joint names of author and editor; but when, in 1873, it was partly ready to print, the health of his Excellency Field-Marshal Count Roon was too much shattered to allow of his informing himself of the contents, so to prevent delay he arranged that the work should be printed without his name on the title-page. It may suggest itself to some readers that the great reorganiser of the German army may have found his own ideas too efficiently reorganised in the present volume, and may not have wished to appear as part author of a work so imbued with "modern ideas" as to man's origin and development, physical, intellectual, moral and religious. However, this is mere conjecture. The book as it now stands is a most valuable manual, and so fully incorporates the results of modern research that Dr. Peschel may be congratulated on its not being entitled a new edition of an older work, belonging to a time when materials were too scanty for a general treatise on Ethnology on a sound basis.

Dr. Peschel arranges his topics in what may be considered their natural order, viz.: Man's Place in Nature, Origin, and Antiquity; Races; Language; Civilisation. He deserves great credit for the care he has taken to refer each point to its original authority, and also to mention the latest researches. For instance, every anthropologist now recognises the fact of the human embryo passing through successive stages in the scale of organic life, but many who are not special biologists will be interested to learn (p. 4) that this fundamental fact was made known, in 1812, by J. F. Meckel, of Halle. Again, few anthropologists in England who have attended to the curious custom of the "couvade," the nursing of the father instead of the mother after childbirth, have met with a paper by Dr. Ploss in the *Jahresbericht des Leipziger Vereins für Erdkunde*, 1871, which is here mentioned (p. 26) as containing new particulars. The chapter on Characteristics of Races is excellent in the full justice done to the physical peculiarities of limbs, skull, skin, hair, &c., on which race-distinctions are grounded by ethnologists. It was all the more necessary to estimate these at their utmost value, as the author argues successfully against such variable characters being used to divide mankind into a number of invariable types or species. Throughout the work Dr. Peschel's arguments and criticisms on the evidence he brings forward are often important, and always worth consideration.

He fairly attacks Dr. Bleek (p. 266) for connecting the worship of ancestors with the use of a particular class of languages, whereas in fact the manes-religion belongs to any and every linguistic class among mankind. There is also importance in the complaint (p. 40) that the artist who copied the famous prehistoric sketch of the mammoth found in the cave of La Madeleine, has made the most of it. It stands to reason that in a science embracing so many and various topics as modern anthropology, it must be peculiarly difficult to avoid errors. We wish to call Dr. Peschel's attention to two statements requiring correction at the first opportunity. Mr. Prestwich certainly made a suggestion as to some of the Abbeville flint implements being chisels for breaking ice-holes, but he will be surprised to find himself (p. 38) responsible for the idea of their having generally been heads of harpoons lost in the river. Also, the broad and narrow skulls figured by Professor Huxley in his paper on Skull-Measurement in No. 1 of the *Journal of Anatomy and Physiology*, are reproduced by Dr. Peschel (p. 56), who describes the narrow one as "skull of a New Zealander." But it is quite unlike a Maori skull, and Professor Huxley expressly gave his opinion that it came from Australia or one of the Negrito islands.

Among the special views of Dr. Peschel likely to cause discussion, is his uncompromising assertion (p. 472) that the higher culture of America, especially of Mexico and Peru, was of native growth, without any elements borrowed from other parts of the world. It may be so, but any writer who maintains this ought to meet and overcome Humboldt's famous argument from the similarity of the calendars of cycles of years in Mexico and Asia. Can the perversely artificial system of combining lists of names of animals, &c., into a chronological series have occurred independently to two distant nations? Another opening for instructive controversy is given by the speculation on the geography of the original home of man (p. 34). This Dr. Peschel finds in the ancient continent called by Professor Sclater "Lemuria," and which once stretched from Africa eastward by Madagascar and Ceylon, perhaps as far as Celebes. Such a continent he thinks is an anthropological necessity, for Australians, Coolies, Papuans, and Negroes to reach their present homes almost dry-shod. As to climate, moreover, this birthplace of man would be situated in the very zone of the anthropoid apes. It is remarked that such a choice of the region of man's first appearance would be more orthodox than seems at first sight, for here we are in the neighbourhood of the four mysterious rivers of Eden, namely, the Nile, Euphrates, Tigris, and Indus. And in the gradual submergence of Lemuria we see pitilessly accomplished the expulsion from Paradise, situated, as the old geographers knew, in South-East Asia. This, Dr. Peschel is careful to add, is only an hypothesis, but it is an hypothesis which may lead to geological investigations of Madagascar, Ceylon, and Rodriguez, and soundings in the Indian Ocean in quest of relics of the vanished land.

EDWARD B. TYLOR.

THE GIPSIES.

Ueber die Mundarten und die Wanderungen der Zigeuner Europa's. Von Dr. Franz Miklosich. (Wien, 1873.)

The English Gipsies and their Language. By Charles G. Leland. (London: Trübner & Co., 1873.)

Romano Lavo-Lil: Word-Book of the Romany; or, English Gipsy Language. By George Borrow. (London: John Murray, 1874.)

MR. LELAND says in his preface: "There are now in existence about three hundred works on the Gipsies, but of the entire number comparatively few contain fresh material gathered from the Rommany themselves;" and how true his statement is may be conceived from the fact that Grellmann himself, who is commonly regarded as the great original authority on Gipsies and Gipsydom, purloined nine-tenths of his materials from older works, and that a large majority of subsequent writers have contented themselves with a reproduction of Grellmann, more or less diluted. To this class, however, of literary impositions the three works now before me form notable exceptions. That of Dr. Miklosich, being purely scientific in its treatment, addresses itself to but a limited number of readers, viz., such philologists as are interested in the origin and history of the Rommany or Gipsy language. His object has been to extract from the thirteen Rommany dialects, now spoken in Europe, all words of European, and more especially of Slavonic, origin, which may help to determine, firstly, the country in which the Gipsies established themselves immediately on their arrival from Asia; and, secondly, the routes which, on breaking up and quitting that country, they must have followed to arrive at their present places of abode. The book then is divided into three portions: of these the first contains a full catalogue, comprising more than five hundred words, of the Slavonic elements in Rommany; the second, some valuable additions to our knowledge of the grammar, besides twelve new vocabularies collected by different contributors in various parts of south-east Europe; while in the third the author gives lists of words borrowed by the Gipsies in their wanderings from the languages of the European countries through which they passed. In the dialect, for instance, of the English Gipsies he has detected words of Greek, Slavonic, Roumanian, Hungarian, German, and French origin, showing that this branch of the race had halted in the countries where these languages are spoken previously to their arrival in England; and by pursuing a like system of investigation with the other dialects, he has been enabled to indicate the routes severally adopted by the Gipsies of Spain, Norway, Germany, &c. Dr. Miklosich also arrives at the conclusion that the Gipsies, on first reaching Europe, lived for a long time, perhaps for one or more centuries, in Greece or in a country with a Greek-speaking population, and that consequently the general opinion, that they did not enter Europe until the beginning of the fifteenth century, i.e. only shortly before their appearance in Western Europe, is untenable; and in support of this conclusion he cites sundry documents hitherto

unpublished, and drawn mainly from Hungarian sources, in which mention is made of Gipsies as early as the fourteenth century. It is a pity, however, that to these documents a German translation is not uniformly appended.

The general plan of the work is admirably executed, but a few minor points remain to be noticed, which seem to me capable of improvement. I regret that Dr. Miklosich has not always arranged his vocabularies in the alphabetical order of the Rommany words, as they would then be far handier for reference; and also that he has not in all cases published them with the original orthography of their collectors, but reduced them to a uniform system of his own. Nor are the words always correctly translated, especially the verbs, which, given in the third person, are generally rendered as infinitives. *Puðleske* means, not *quaerere*, but "ask him;" *mistotukierava*, not *gratia*, but "I do good to you;" *symadytchorava*, not *pignus*, but "I deposit a pledge;" and *dalagudly*, not *tumultus*, but "there is a noise." In his derivations, also, of certain words the author has been misled by the blunders of others. Thus, *iasia vallacai*, given in an early English-Rommany vocabulary by Bryant as meaning "to command," consists in reality of the four words *jas* or *vel acai*, "go or come here," and cannot, therefore, by any possibility be connected with the Hungarian *vala*. Still, with all these and other faults, the book is a most valuable one, telling us more concerning the actual history of the Gipsies since their arrival in Europe, than is to be gathered from any previous work. What now remains to be done is to pursue a similar course of investigation with respect to the Rommany race during its wanderings in Asia, and on this branch of the subject Dr. Miklosich is, as he lately told me, now engaged.

Mr. Leland, author of the well-known *Hans Breitmann's Ballads*, is an American. During a long residence in England he has made the acquaintance of a large number of English Gipsies, and by them has been initiated into the mysteries of *rockering Rommanes*, or speaking Gipsy. He now gives us the result of his thus-acquired knowledge in a pleasant readable volume, consisting, not of formal grammar or vocabulary, but of Gipsy conversations, stories, &c., given in their original Rommany, and followed by an English translation. The great charm of the book is that its author has thoroughly caught the Gipsy spirit. He sets before us the Rommany, as he acts and thinks, in a manner which no other writer has succeeded in doing, for the very good reason that he is the only writer who has been really admitted behind the back scenes of Gipsy life.

The specimens of the Rommany language, given throughout the book, are good. Many of Mr. Leland's words, not occurring in any previously published collection, were already familiar to me when I first read his book; others, whose genuineness I was then inclined to question, I have since verified. There still remain a large number on which I cannot speak with certainty. Such words as *seemor*, dolphin; *kismut*, destiny; *shaator*, the Scriptures, &c., may exist in

English Rommany; all I can say is that I have never met with them. At the same time, I would remark that English Gipsies are so apt to mix up Rommany, Canting, and English words, that it is very difficult at times to come at the true source of a word. Thus, *toffer*, a well-dressed woman, given by Mr. Leland as a Gipsy word, and derived by him from the Gipsy verb *tove*, "to wash," seems to me more probably to owe its origin to the old French *attiffé*, "decked, tricked out." *Jockey*, which he derives from *chuckni*, "a whip," existed in England years before the Gipsies ever set foot in the land, to judge from the old line, "Jocky of Norfolk, be not too bold," &c. Again, *sechiatty*, "full of life," should, I think, have been written *zi-y hearty*; *zi-y* being a mongrel adjective formed from *zi*, heart, and *hearty* the English word added by the Gipsy narrator of the story, in which the word occurs, in explanation of the preceding *zi-y*. Sometimes with a genuine Gipsy word our author seems to go out of his way for a far-fetched derivation, with one lying before him. In *hindi tem mush*, "an Irishman," he connects the *hindi* with "Hindu." In reality it merely means "dirty," being a participle of a lost verb, *khiava*, *cacare*, still in use amongst the Gipsies of Turkey. *Sarishan* (more properly *sar shan*), the ordinary Gipsy greeting, he regards as identical with the Hindu *sar i sham*, early in the evening; whereas it is really neither more nor less than a translation of the English "how are you," *sar* meaning "how," and *shan* being the second person of the Rommany verb "to be." In connecting, however, the slang phrase "up to trap" with the Gipsy *drab*, "herb," Mr. Leland is undoubtedly right, and the use of *drab*, in the sense of "tobacco," which I have heard amongst Gipsies in Hungary, still further links the phrase with another slang expression "up to snuff." Space forbids my dwelling longer on the subject of the language, but I can assure any would-be student of Rommany that he will find the book a very quarry of information on the subject—a quarry, though, where he must work for himself, and not look to find his materials already hewn and fit for use.

The work also contains a mass of Gipsy Folk-lore. It is curious to find current amongst the Gipsies such stories as those of the Seven Whistlers, of the Baker's Daughter changed by Christ into an owl, of the Flounder's mouth being made crooked, or such a usage as that of burning an ashen fire on Christmas Day. In connexion with this last point, I may here mention that I know a certain village in Germany, near Nordhansen, where at Whitsuntide Gipsies assemble from all parts of the continent to observe a rude form of tree-worship, a fact which I commend to the notice of Mr. Fergusson. Curious, too, is the whole question of the origin of the pseudo-Christian legends, which are current among the Gipsies of all parts of Europe, and samples of which occur in Mr. Leland's work. His legends would, I think, have gained in interest had he compared them with those given by M. Bataillard and other continental writers.

Finally, Mr. Leland, to establish his theory that the Gipsies are descendants of the

Doms, *i.e.* are of a non-Aryan origin, must furnish more substantial proofs than what may be only the merely accidental resemblance of a name. The physiognomy and language of the Gipsies point to a widely different conclusion, viz. that the Rommanies are very Aryans of the Aryans. Their language, indeed, according to Dr. Miklosich, may claim the rank of being regarded not as the descendant of any one of the seven modern Aryan languages of India, but as an elder member of the same family—as a sister of the others, not as a daughter of any one of them.

There remains yet to be noticed another English work on the Gipsy language—a *Romano Lavo-Lil*, or *Gipsy Dictionary*, by Mr. George Borrow, author of the *Gipsies of Spain*, *Lavengro*, *Romany Rye*, &c. When the *Gipsies of Spain* first appeared, now some thirty years ago, there were, I imagine, not two educated men in England who possessed the slightest knowledge of Rommany; and, consequently, all Mr. Borrow's statements regarding the manners and language of the Spanish Gipsies were received with implicit belief. In Germany it was otherwise. There Dr. Diefenbach and Professor Pott subjected his vocabulary to a searching criticism, but even they would seem in no wise to have questioned its claims to originality. Pott mentions Bright's *Travels in Hungary* (Edinburgh, 1819), but does not appear to have seen the book itself, or he would have found that in the appendix to it is a Spanish-Rommany Vocabulary, where many of the most doubtful words in Mr. Borrow's collection had already appeared, such as *sacais*, eyes, *fila*, face, *otembrolilo*, heart, *chindoguendo*, blind, *buchi*, executioner, *brinza*, meat, *otarpe*, heaven, &c. Now it may be said that these words really exist in Spanish-Rommany; and that, therefore, there is little cause for wonder at their occurring in both collections; but I appeal to any one, who has carefully studied vocabularies by different collectors, whether they would be likely to appear in precisely the same form, in two collections made by different persons and at different times, when even so common a word as that for "bread" is given in various English-Rommany vocabularies as *mauro*, *malo*, *màro*, *maroo*, *moro*, and *morro*. Whether the above words do really exist in the dialect of the Spanish Gipsies, is a question into which I cannot now enter, much as I should like to do so; but I deemed it necessary, before proceeding to criticise his present work, to point out that Mr. Borrow's claims to be considered an authority on Rommany may not be so paramount as has generally been imagined.

In the *Romano Lavo-Lil* the first thing which struck me was the absence of a number of words, given by Mr. Borrow in his earlier writings as belonging to the English-Gipsy dialect. One looks in vain for *shukaro*, "hammer," *covantz*, "anvil," *dearginnu*, it "thundreth," and other words familiar to the readers of *Lavengro* and the *Romany Rye*, or for an explanation of the obscure verse in *Wild Wales*, "*Ando berkho Rye canó*," &c., which latter, though fairly intelligible to any one acquainted with continental Rommany, would, I fancy, be Hebrew to the travellers of the English roads. Still, with

these omissions, Mr. Borrow's present vocabulary makes a goodly show, extending over some ninety pages, and containing no fewer than fourteen hundred words, of which about fifty will be entirely new to those who only know Rommany in books. The words, too, are in the main correct, though I cannot quite agree to the forms *guero*, "fellow," *bowle*, "snail," *gristur*, "horse," *Dibble*, "God," &c.; and there occasionally occurs a mistake similar to that of Dr. Miklosich, viz., the rendering of the third person of the verb as the first person or an infinitive, two instances of which are to be found on the first page, where *apasavello* is translated by "I believe," and *artavello* by "to pardon." Here and there English words have crept in among the Rommany, as *yarb*, herb, which is merely the west-country pronunciation of the English word; and *mukalis bicunye*, "let it alone," should, I imagine, be written *muk lis be, can ye*. In *naval*, "thread," we perhaps see simply a confusion of the two meanings of the Rommany word *dori*, "string or thread," and "navel."

Mr. Borrow does not seem to me to be very strong in derivations. *Luvvo*, "money," he refers to a Slavonic word *lúvok*, "convenient;" but it far more probably comes, as suggested by Dr. Paspatis, from the Gr. ὀβολός, by transposition; just as *olavas*, "stockings," becomes with some Gipsies *ovalas*. Again, he is wrong in regarding *engro* as an independent word, signifying "fellow." In so doing he follows Colonel Harriot, whose mistake was pointed out by Pott in his great work *Die Zigeuner* (Halle, 1844), where he shows that *-gro* is an adjectival termination, representing the Sanskrit *kara*, in such words as *rathakara*, wheelmaker. Nor are such double adjectival forms as *pov-engreskey*, of which Mr. Borrow gives several examples, admissible in Rommany. When he says that *possey-mengri* is improperly used for any fork but "a pitchfork," connecting it with *pus*, "straw," he would seem to be unaware of the existence of a Rommany verb *pussa*, "to stick," whence also *bussis*, "spurs," which word again he incorrectly derives from the Mod. Gr. βίσαρον, "torment." *Tava* he defines as an affix, by which the future of a verb is formed; but when we consider that the Rommany *v* almost invariably represents the Sanskrit *m* (cf. *puv*, "earth," *hiv*, "snow," &c.), it becomes plain that in *-ava* we really have the termination of the first person. Indeed, in the east of Europe the two forms *kamama* and *kamava* exist side by side. As a matter of fact, English Rommany possesses no future. By far the best portion of Mr. Borrow's book is his specimens of Gipsy songs. In one of them, *Tugnis amande* (more properly *Tugno se mande*), I recognise an old Rommany favourite. Of his prose I cannot say so much. It is the Rommany of the study rather than of the tents. Let any one compare Mr. Leland's version of the story of the Deluge with Mr. Borrow's account of his visit to Thomas Herne, and he will see what I mean. Mr. Borrow has attempted to rehabilitate English Rommany by enduing it with forms and inflexions, of which some are still rarely to be heard, some extinct, and others absolutely incorrect; whilst Mr. Leland has been content to give it as it really is; and of the two methods

I cannot doubt that most readers will agree with me in thinking that Mr. Leland's is the more satisfactory.

FRANCIS HINDES GROOME.

UNIVERSITY EXTENSION AT OXFORD.

In the form of *Replies to a Circular Letter of Enquiry*, sent by the Vice-Chancellor in the course of last year to the several Boards of Studies and Professors, we have the opinions of several Oxford professors on the following points: (1) The creation of additional professors. (2) The distribution of subjects among the professors. (3) The employment of assistant-professors. (4) Temporary provision for certain subjects (an expression explained by the answers).

The Board of Studies for the first public examination demand two additional professors and four readers of Philology—the readers rather co-operating with, than subordinated to, the professors. Minute subdivision of subjects is disclaimed. The occasional assistance of persons not professors, or readers, is admitted. These suggestions are repeatedly by the representatives of *literae humaniores*. Further, two readers in Philosophy, in history an additional professor and reader, are required. This answer (supported by the weight of Professor Jowett's name) would be nearly unanimous, but for the indignant protest of Professor Chandler against an extension of the professoriate, from which he predicts "nothing but incessant squabbling." He regards professorial lectures as a "barbarous mode of teaching."

For Mathematics are claimed four additional professors: two in pure, two in applied, mathematics. Readers should be appointed. Their duties and the distribution of subjects might be subsequently settled. The occasional employment of persons distinguished in any particular branch of science is approved. We may observe, that a similar opinion is appended to all the most thoughtful answers.

In the school of Natural History we may distinguish opinions on physics, chemistry, biology and geology. Four professors, one for each of the branches of physics (acoustics, optics, heat, electricity); one demonstrator at least for each professor; also a professor to teach experimental physics—this programme meets with general favour. It is proposed that the whole department of chemistry should be under the control of one professor, amply supported by assistant professors. For biology, Professor Rolleston proposes three professorships: (1) comparative anatomy, zoology and histology; (2) human anatomy, physiology, ethnology; (3) physiological, as opposed to anatomical and morphological. We have not space to enumerate Professor Phillips's suggestions with regard to geology; far less to criticise Professor Westwood's demand for a professor in natural theology, to counteract the "atheistical demoralisation resulting from the unlimited teaching of Darwinism."

In the school of Modern History we find conflicting views—that of the majority, represented by Professor Stubbs, advocating considerable modifications of the present system; and that of Professor Burrows, who would leave things very much as they are.

The Board of Studies for the School of Jurisprudence propose two lecturers in Roman, and two in English law: "within certain limits a lecturer on Roman law might be allowed to lecture on English law." Similar views are lucidly advocated by Professor Bryce. He observes: "A teacher is apt to get weary of always treading the same round, and may be expected to lecture all the better on his own subject after having been led to consider it from a new point of view in dealing with a cognate one." He proposes also a professorship of canon and ecclesiastical law.

The School of Theology appears stagnant.

For subjects not recognised in the schools there

appears to be at present sufficient provision; as "it is impossible at Oxford to teach more than what is required for the examinations." Were it otherwise, were a real school of comparative philology, for instance, to be established at Oxford, in that case Professor Max Müller would think seven professorships necessary.

The professor of Fine Arts (after descending on the material arrangements of his drawing-class, proposes two professorships, one of painting, the other of modelling.

Dr. Acland thinks that for the "scientific side alone of Medicine it is desirable to appoint four additional professors.

We do not perceive that it has occurred to anybody that the want of a Professorship of the English Language is still a scandal to the University.

Altogether, the perusal of this document is not a very encouraging one for those reformers who desire that our old English universities should be brought up to the level of the best high schools of the continent, and regain their reputation as the advanced guards of culture and knowledge.

NOTES AND NEWS.

A SINGULAR exhibition is to be given in the Palais d'Industrie, at Paris, from September 15 to October 11, under the auspices of the Société Centrale d'Agriculture and d'Insectologie, of all the useful insects and their products, and of the noxious insects and the depredations they commit. This is the fourth exhibition of the kind, the last having been held in 1872 in the Luxembourg Gardens.

The first division consists of useful insects arranged in six classes: each species should be shown in its several stages of egg, larva, chrysalis, and the perfect insect. First among these are the silk-producing insects, then those producing honey and wax, among which are the honey-bearing ants, of which one species has been long known in Mexico, and its honey utilised. Next follow the insects yielding colouring matter—cochineal, gall, &c. The fourth class comprises the edible insects: the water-bug (*Notonecta* and *Corisa*), whose eggs are converted into bread, and under the name of "haulté" sold in the markets of the cities of Mexico, and particularly in the capital, where the eggs are gathered from aquatic insects found in the lakes, more especially in that of Tezcuco; then follow the grugru worm, or eatable caterpillar of the cabbage palm; the locusts of America and Australia, crickets and grasshoppers, white ants (termites), the eatable spiders (*Epeira edulis*) of Polynesia, etc. The fifth class comprises the insects used in medicine: cantharides, etc.; the sixth, those used as ornaments, as the phosphorescent insects, beetles, etc.

The second division (the noxious insects) include those that are injurious to the cerealia, the vine, oleaginous plants, textiles, medicinal and ornamental plants; those hurtful to forest trees and to building timber, which destroy wool, horse-hair, and feathers; parasitic insects, etc.

The exhibition promises to be one of great interest, and likely to be productive of useful results.

DR. J. M. TONER has published, at New York, a useful little volume of 120 pages, entitled a *Dictionary of Elevations and Climatic Register of the United States*, in which the height in feet above the sea-level is given of all the cities, towns, and localities in the United States that the compiler has been able to find a measurement of, and also the latitude, mean annual temperature, and the total annual rain-fall of many places. The object of Dr. Toner in this compilation has been to place within reach of the medical profession a record that may enable and induce professional men in different localities to observe, record, and contrast the influence of elevation, if it has any, on health and disease.

DR. HERMES has detected the presence in the

Aquarium at Berlin of three specimens of the rare infusorial animalcule discovered by Dr. Hoffmann and named after him *Choloeus Hoffmanni*.

THE Dutch papers are warning the general public that the curious-looking nuts which have lately been imported from Acheen, and are being extensively sold as playthings owing to their fancied resemblance to an ape's head, are poisonous, and ought not to be given to children.

THE prize instituted by the late Dr. S. F. Stiebel, of Frankfort a. M., for the best essay on questions connected with development generally, and the treatment of children's diseases specially, was lately awarded for the first time at Frankfort. The successful competitor was Professor Lieberkühn, of Marburg, whose investigations on the development of the eye in the vertebrata have secured him a European reputation, and his essay for the Stiebel prize is pronounced to be fully equal to his other contributions to science. We learn from the report of the committee appointed to award the prize that the capital from which the money is derived consists of the funds raised by the friends and admirers of the late Dr. Stiebel to celebrate, on May 3, 1865, the jubilee of his fifty years' doctorate. This money was left by the professor at his death, in 1868, for the purpose to which, after the interval prescribed by himself for its accumulation, it is now for the first time so satisfactorily applied.

Bleaching Ivory and Bone.—M. Cloez has recently explained to the Society for the Encouragement of Industry of Paris a mode he has discovered of whitening bones. At the request of M. Gratiot he was trying to remove the disagreeable odour of skeletons, and supposing a solvent of fatty matters would succeed, employed spirit of turpentine, and was surprised to find that after three or four days' exposure to light the bones became dazzlingly white. In the shade they must be immersed longer. Wood may be bleached in the same way, and essences isomeric with turpentine—that of citron for example—have the same effect. The substances to be bleached should be suspended a few millimètres above the bottom of the vessel, above the thin layer of acid that is deposited.

The Temperature of the Sun.—*Der Naturforscher*, No. 22, has a paper on this subject, detailing experiments by Father Secchi, comparing the radiating power of the carbon poles of a voltaic battery capable of melting platinum with that of the sun. He found the latter $36\frac{1}{2}$ times as much as the former; and, reckoning the heat of the voltaic arc at $3,000^\circ$, he concluded that of the sun to be from $133,780^\circ$ to $169,980^\circ$, according to the allowance made for absorption of solar heat by our atmosphere. The writer, who only gives the initials 'R. M.', compares these results with others obtained by various processes, and comments on their excessive disagreements. Thus, Deville made the solar temperature $2,500^\circ$ to $2,800^\circ$, Secchi in former experiments $5,801,846^\circ$, and Zollner $61,350^\circ$. Evidently the subject requires a careful examination of the probable value of the various methods by which the discordant results were obtained.

Dichroism through Tension.—*Der Naturforscher*, citing the *Annalen der Physik und der Chemie*, states, on the authority of Herr August Kundt, that gutta-percha and caoutchouc become dichroic by stretching, and exhibit a dark brown tint in one direction, and a straw yellow one in another.

It has been proposed to establish a Medical College in Italy to commemorate the centenary of the death of St. Thomas Aquinas (1274). After first considering the expediency of placing it at Naples, the committee appointed to decide the question finally determined upon Rome as the site of the institution, and at a meeting recently held at the house of Dr. Rudel, formerly professor at the Sapienza College, the necessary steps were taken for its formal inauguration.

It is with much regret that we record the death at an early age of the well-known Italian savant, Professor Domenico Cipoletti, late assistant at the Observatory, Florence. Although still a young man he had acquired a high reputation as an original investigator and careful observer, and his early death will prove a severe loss to science.

A MAGNIFICENT specimen of the rare *Yucca longifolia* is at present exciting much attention from botanists and the public generally at Lübeck, where this colossal Mexican plant is blooming in the nursery of the Messrs. Spalckhaven. It is upwards of eight feet in height, has more than five hundred leaves, which measure from six to seven feet in length, and is now exhibiting a colossal raceme of bloom nearly six feet high. This noble specimen of the Yucca family is unlike any other plant to be met with in botanical works, although it bears great resemblance to *Xanthorrhoea hastilis*, and is conjectured to be about seventy or eighty years old, judging by the description given of it when it passed into the possession of the Spalckhaven family forty years ago.

The French Standard Metre.—At a recent meeting of the Society for the Encouragement of Industry, of Paris, M. Debray explained, on behalf of M. St. Claire Deville and himself, the mode of obtaining a pure alloy of platinum and iridium, of which to form the standard mètres, as recommended by the International Commission on Weights and Measures. This alloy, ten of iridium to one hundred of platinum, is said to be unalterable, but the process of getting iridium free from osmium to make it is very complicated, involving a number of processes, which will be found in the *Revue Scientifique*, No. xx., 1874.

Balloon Ascent of MM. Croce Spinelli and Sivel.—M. Lissajou, describing this ascent, explained that the aeronauts reached an elevation of 7,800 mètres. They found the temperature gradually decreasing, except when traversing clouds, beyond which the thermometer marked -22° C. At a height of 4,500 mètres they saw below their car crystals glowing in the sun, and below them white clouds which could only have been composed of frozen particles. The rays of the solar spectrum indicating vapour of water disappeared at the limit of their voyage. Thus, this vapour does not belong to the solar surface. At 5,000 mètres they felt uncomfortable, and had recourse to vessels containing a mixture of 40 oxygen and 60 nitrogen. At 6,000 mètres they used another mixture containing 75 per cent. of oxygen, and each time their physical and mental powers that had been weakened were restored. Thanks to these inhalations M. Croce Spinelli was able to remove an old error, and show that the sombre colour of the sky observed at great heights is the result of fatigue. After each inhalation of oxygen the blue of the sky reappeared.

A STORMY meeting was held at Berlin on May 28, to consider the question of cremation, in the course of which Dr. Baginsky advocated the practice on hygienic principles, and Dr. Bernstein on those of pious respect for the ashes of the dead, and he assured the assembly, amongst whom were many ladies, that he looked forward with satisfaction to a time when bust-crowned columbaria would prove the most attractive decorations of our high roads and other public thoroughfares. In these and other analogous matters we should, he thought, do well to imitate the ancients, who showed their superior veneration for the remains of the departed by raising pyramids in the desert, planning a mausoleum within the walls of cities, and laying down a "Via Appia" for the daily tread of all orders of the community.

THE volume of the *Zoological Record* for 1872, just published by Mr. Van Voorst, is the last to be edited by Professor Alfred Newton, F.R.S. The next volume is to be compiled under the editorship of Mr. E. C. Rye, the newly appointed Librarian of the Royal Geographical Society.

THE fifth Annual Report of the New Zealand Institute for 1873, published at Wellington, has just arrived in this country. It contains notices of the present state of the Museum, Herbarium, Laboratory, Time Observatory, Geological Survey, &c. The practice adopted by the Institute of printing in one volume the Transactions of the affiliated societies in the colony is found to answer well. Each scientific society in New Zealand that becomes affiliated to the Institute receives a share of an annual parliamentary grant in proportion to the amount of work done by its members. During the last five years 445 communications have been read before the different societies (viz. Auckland Institute, Wellington Philosophical Society, Otago Institute, Philosophical Institute of Canterbury and Nelson Association), of which 286 have been printed at length. With few exceptions, all these papers relate directly to the colony, and comprise in round numbers about 120 on zoology, 70 on botany, 53 on chemistry and metallurgy, 60 on geology and physical geography, and about 120 papers on miscellaneous subjects, chiefly relating to ethnological considerations of the aboriginal race, or connected with the industrial resources of the colony.

It is an admitted fact, which physiologists may explain if they can, that women, whatever else they may be, are not inventive in the broadly scientific sense of the word. On this account we record with satisfaction the announcement that reaches us from San Francisco, of a lady of that city who has invented a new kind of needle, which has the advantage of admitting of the insertion of a finer thread than ordinary needles, and making a proportionately smaller hole in the process of sewing.

SCIENCE has sustained a heavy loss in the sudden death of Dr. Aloys Pichler, on June 3, at the age of forty-one. His long and active connexion with the University of Munich, and the admirable manner in which he performed the duties of his office while he held the post of Head Librarian at the Imperial Library of St. Petersburg, will cause his death to be regarded with special regret among scientific men in Bavaria and Russia.

THE Working Men's College Natural History Society and Field Club's scheme of work for this month is: Lectures, &c. (Tuesdays, at 8 p.m.)—16th, Mr. J. A. Foster, on "Actina;" 2nd, 9th, and 23rd, Museum Work (naming and mounting fossils); 30th, Mr. Fotheringham on "The Salmon of the Pacific Coast." Field days: 7th, Botany (Mr. Grizeon), at Esher (from Waterloo 9.45 a.m.); 27th, Bone Beds (Mr. R. L. Fleming), at Ilford (Great Eastern 3.8 p.m.).

SOME time ago we drew attention to the discovery of three leaves of the Curetonian Syriac Gospels, which originally belonged to a MS. in the British Museum, but have now found their way to Berlin. Professor Wright, of Cambridge, has followed up his edition of the text of these fragments by that of fragments of the Homilies of Cyril of Alexandria, which have shared the same fate as those of the Gospels. They were discovered, with other fragments, by the Rev. J. R. Crowfoot, author of *Fragmenta Evangelica*, on a visit to the Nitrian monastery in the autumn of 1873, by whom they were presented to Dr. Wright. The editor states that it is his intention to present them to our national collection.

THE controversy in regard to the site of ancient Troy, and the reality of the events interwoven with the mythological framework of the Homeric poems may lend some additional interest to Dr. Gustav Körting's recently published *Contributions to the History of the Troy-Myth in its Transition from the Ancient to the Romantic Form* (Halle, 1874), in which the author considers the character and most probable source of the "Dietya" and "Dares" compilations which supplied the materials for the greater number of those half-mythical, half-romantic

legends of Troy, which were so popular in Europe during the early middle ages. The *Dictys Cretensis*, *sive Lucii Septimii Ephemerides belli Trojani*, and *Daretis Phrygii de excidio Trojæ Historia*, appear by their bad Latinity to belong to a period not earlier than the fourth, and perhaps as late as the seventh century; but although this point is generally admitted by scholars, the question whether they are genuine Latin compositions, or mere translations or compilations of Greek originals, is not so easily disposed of, and this is the enquiry into which Dr. Körting enters. The Latinists of the sixteenth century generally adopted the latter view, and in the year 1540 a fine folio edition of these much-read and often-quoted tales appeared in a German form at Augsburg, translated by "Marcus Tattius," and printed by Haynrich Stagner. In that *édition de l'ure* the *Dictys* and *Dares* collections may, however, be said to have reached the culminating point of their popularity. From that time they rapidly sank into oblivion, from which they can scarcely be said to have been rescued till 1832, when Niebuhr's selection of these tales for the subject of a prize essay again directed attention to them. In recent times, Drs. Dunger and Joly have advocated the *Dictys* and *Dares* claim to a Latin origin, but Dr. Körting is of opinion that there is no valid ground for this view, and that, on the contrary, the evidence is entirely in favour of the assumption, maintained in earlier times, that these collections have been derived from ancient Greek sources.

MR. MATHEWS, of Exeter College, Oxford, has brought out the "first recension" of Ibn Ezra's *Commentary on the Canticles* (London: Trübner), on the basis of three MSS. He has added a literal translation, which opens the work to those not familiar with Rabbinical Hebrew, and will also be of great service to those who are beginning its study. Mr. Mathews accepts Grätz's opinion, that though Ibn Ezra gives two distinct expositions of the Song, he only believes in the former or literal one, which explains the poem of the love between a young girl and a shepherd. This is not improbable, in spite of Ibn Ezra's vehement disclaimers, for his admissions with regard to the Pentateuch and the Book of Isaiah (see Cheyne's *Book of Isaiah Chronologically Arranged*, London: 1870) prove that he was free from the worst critical prejudices of his age, though he did not venture to speak out, either, as Dr. Grätz thinks, from his dread of being charged with heresy, or, as Mr. Cheyne, from a feeling that traditional views about the Bible could not be disturbed without danger to religion.

PROFESSOR WHITNEY's admirable *Lectures on Language* find appreciation in Germany. A translation with additions has just been brought out by Dr. Jolly, author of a treatise on the Infinitive.

IN the May number of the *Indian Antiquary* the Rev. C. E. Kennet gives a brief account of the two branches of the Vaishnava sect in S. India, viz., the *Vadakalai* and *Tenkalai*. As regards final beatitude, the former are said to insist on the "concomitancy of the human will" for securing salvation, whereas the latter maintain the "irresistibility of divine grace;" thus exhibiting a controversy similar to that between the Calvinists and Arminians. In another paper Mr. Narasimiyengar states that the *Tenkalai* are the only sect by which the hideous rite of shaving the heads of widows has not been adopted. In the same number Professor R. G. Bhandarkar explains the courses of sacred study enjoined in the various Brahmanical schools; and Capt. J. S. F. Mackenzie gives an account of the *Panchāṅga* or Indian almanack.

THE number of the *Journal of the Royal Asiatic Society* (New Series, vol. vii., pt. i.), just published, contains some important philological papers. Professor R. C. Childers gives the first part of the Pali text of the *Mahāparinibbāna Sutta*; and a paper on the formation of the plural

of Sinhalese neuter nouns. The number further contains the Pali text and an annotated translation of the *Upasampadda-Kammavācā*, or the Buddhist manual of the form and manner of ordering of Priests and Deacons, by Mr. J. F. Dickson; and the text and translation of three inscriptions, in the Elu or ancient Sinhalese, of *Parākrama the Great*, by Mr. T. W. Rhys Davids. Professor W. Wright gives a specimen of a new Syriac version of the *Kalilah-wa-Dimnah*, with an English translation. Professor H. Kern's translation (from the Sanskrit) of Varāhamihira's *Bṛhat-Saṃhitā*, or complete system of Natural Astrology, published in this Journal, is continued in the present number, from the sixty-fifth to the eighty-fifth chapter. The remaining papers are: "Notes on the Megalithic Monuments of the Coimbatore District," by Mr. M. J. Walhouse; "On the Valley of Choombi," by Dr. A. Campbell; "The Name of the Twelfth Imām on the Coinage of Egypt," by M. H. Sauvage and Mr. S. L. Poole, with a note, by the latter scholar, on the names of the Capitals of Egypt; and a paper on the Kharāj or Muhammadan Land Tax; its application to British India, and effect on the Tenure of Land, by Mr. N. B. E. Baillie.

O Novo Mundo for May 23 publishes a considerable vocabulary, together with fragments of the etymology, phrases, etc., of the language of the Guanás and Chanés—little-known Indian tribes inhabiting the district of Miranda in Matto Grosso, along the Paraguay, in the neighbourhood of Albuquerque. A dictionary containing more than 2,000 vocables of this language was destroyed in 1867 in the sacking of Nioac. Captain Tanuay, of the Brazilian artillery, is the scholar to whose painstaking we owe the collection. From the same journal we learn of the publication of the second volume of Dr. Almeida's *Historical Memoirs of the Extinct State of Maranhão*. The preceding was occupied with the history of the Society of Jesus; this one contains many rare documents, relations, journals, etc., of great interest for the early history of the Amazon. Another great river is fitly honoured in the *Biblioteca del Río de la Plata*, a collection of works, documents, and notices, unpublished or little known, relating to the physical, political, and literary history of the river, edited by Dr. Don Andrés Lamas, and now issuing in parts at Buenos Ayres.—*Nation*.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (Monday, June 1).

SIR SIDNEY SMITH SAUNDERS, President, in the Chair. Mr. McLachlan exhibited specimens of the white ant (*Calotermes* sp.), recently bred at Kew from a sample of the wood of the tree (*Trachylobium Hornmannianum*) that produces the gum copal of Zanzibar. Mr. Stainton read a letter which he had received from the Rev. P. H. Newnam, of Stonehouse, Devon, stating that he had taken two living specimens of *Deiopeia pulchella* on the Cornish side of the river Tamar. Mr. Stainton remarked on the unusual circumstance of the insect having been captured in the month of May, whereas it does not usually appear until a much later season.

Mr. Charles O. Waterhouse sent for exhibition a living specimen of a mantid (*Empusa pauperata*), in the larva or pupa state, brought to this country by the Rev. Mr. Sandes, of Wandsworth, from Hyères. He had tried to feed it with flies, but could not induce it to eat anything while he was looking on. Mr. Stainton remarked that it would probably have seized a live spider at once, if it had been offered one.

Mr. W. D. Gooch communicated a detailed account of his experiences with regard to the Longicorn Coffee Borers of Natal. Dr. Horn (of Philadelphia) stated that European conifera, limes, &c., planted in a public park at Philadelphia, were all killed by the larvae of native species, such as *Callidium antennatum* and *Monohammus*

dentator, though apparently in a healthy condition, whilst the native trees were not perceptibly affected. He was inclined to believe that the insects attacked healthy trees; but Mr. McLachlan stated that, according to the observations of most European entomologists, the European species of longicorns did not attack living wood in a perfectly healthy state.

Mr. Butler communicated a paper on "New Species and a new Genus of Diurnal Lepidoptera in the Collection of Mr. Druce."

Mr. Smith read a Revision of the Hymenopterous 300 genera *Cleptes*, *Parnopes*, *Anthraxias*, *Pyria* and *Stilbum*, with descriptions of new species of those genera, and also of new species of the genus *Chrysus*, from North China and from Australia. The genus *Anthraxias* was noticed as specially interesting, as it did not appear to have been recognised since Klug published the brief generic character; but Mr. Smith had been able to recognise it from a specimen in the collection of the late Mr. Shuckhard, where it had evidently been mistaken for an example of *Parnopes carnea*, which it closely resembled.

LONDON AND MIDDLESEX ARCHAEOLOGICAL SOCIETY (Monday, June 8).

MR. WALTER RYE exhibited and described a series of Diaries and Account Books kept by the Isham family, of Lamport Hall, in the seventeenth century. Of these, one comprised many interesting references to the habits and customs of the time. It commences in the year 1671, and was kept by Thomas Isham, who had been induced by his father to keep a diary of all events which occurred at Lamport Hall. Mention appears of such guests as were entertained by the family, the amusements prepared for their gratification, and special references to local sports and games. A description occurs of a "barring out" at a school in Shrewsbury, the shutting up in a cellar of one Mr. Gedney, a clergyman, by Lord Banbury; stories of murders, burglaries, etc.; and a record of the burning of a woman in Smithfield for clipping coin, etc. The diaries and other books are no less than fourteen in number, and contain many matters of general and local interest.

Mr. Edward Baddeley communicated an account of the restorations now progressing at the church of St. Helen's, Bishopsgate, and exhibited a sketch of some early work which has been recently disclosed. In opening up the chapels of the Holy Ghost and that of the Blessed Virgin, it has been found that the walls are composed of wrought stone work in good preservation, and which had probably belonged to the earlier buildings; portions of massive columns have also been exhumed, fragments of a flooring of encaustic tiles, and numerous other interesting objects. The chapel on the south side of the choir contains the monument of Sir John Crosby, which, with other memorials of distinguished citizens, will be duly cared for in the present alterations by the Merchant Taylors' Company. It is also hoped that as much as is possible of the ancient work which is now uncovered will be utilised in the restorations, and the early character of the chapel preserved. Photographs of the discoveries were exhibited, and copies presented to the library of the Society, by Mr. R. H. Hills.

Mr. Thomas Milbourn read a paper entitled, "Notes on the History of Royston." He remarked that this town—situate in two counties, viz. Hertford and Cambridgeshire—was prior to the reign of Henry VIII. in the five several parishes of Therfield, Barkway, Bassingbourne, Melbourn, and Kneesworth, but was subsequently constituted a parish by Act of Parliament. It is not mentioned in Domesday, and from this circumstance the author argued that it could have possessed little, if any, importance in Roman or Saxon times. He rather attributed its origin to the erection of monastic buildings by Eustace de Merc in the twelfth century, quoting Camden and other authorities in support of the opinion. For many

years it was known as Royse's Cross, from the Norman tradition of a cross having been erected upon the roadside by a lady named Roysia. The first royal charter was from Richard I., and dated from Bury St. Edmunds. It is of considerable length and contains many facts of interest. In the time of King Henry III. the monastery was enlarged, and in a charter dated at Windsor in the thirty-fifth year of his reign, the King confirms to the prior and canons all their grants and possessions. Similar and further concessions were made by Edward I.—III. and succeeding monarchs. Various indentures and covenants entered into by the priors were next quoted by Mr. Milbourn, and mention made of the condition of the convents at the time of the Dissolution. In the ministers' accounts of this period is a schedule of all properties possessed, rents paid, and many names of ancient hostleries in the town: for example, the Lamb, Crane, Swan, Taberd, Crown, &c. The revenues at this period were estimated at the annual sum of 89*l*. 16*s*., and the site was granted by the King to Robert Chester, one of his gentleman ushers. The ancient hospital in Baldock Street was next described, the church and its monuments, and mention made of such distinguished personages as had been connected with locality.

Mr. A. S. Hobson, F.C.S., exhibited some well executed rubbings of monumental brasses from Lynn in Norfolk, Newark, and St. Albans.

GEOLOGICAL SOCIETY (Wednesday, June 10).

MR. J. EVANS, F.R.S., President, in the Chair.—A paper was read by Mr. W. Whitaker, "On the occurrence of Thanet-beds and of Crag at Sudbury, Suffolk." In conducting the geological survey of the country around Sudbury, the author had observed certain sections proving the existence of Thanet-sands in this district. In the absence of fossils, the determination was based partly on their lithological characters—the sands resembling those of West Kent—and partly on their stratigraphical position, below the Woolwich-and-Reading beds and immediately above the layer of green-coated flints on the top of the chalk. Mr. Whitaker had also noticed certain beds which he believed might be referred to the Red Crag, at a higher level and further west than had been previously observed.—Mr. Prestwich communicated some "Notes on the Phenomena of the Quaternary Period in the Isle of Portland and around Weymouth." The quaternary deposits occur in patches scattered over the district. The oldest of these deposits is represented by a patch of mammaliferous high-level drift, occurring at an elevation of 400 feet above the sea-level, at the Admiralty Quarries. This bed contains highly-polished pebbles of chert from the Greensand, and of sarsen-stone or Druid-sandstone. Looking at the character of the remains in the old river-gravels, and the direction in which they must have travelled, the author was led to conclude that the disturbance by which the strata between Portland and Dorchester had been thrown into a great anticlinal arch must have occurred subsequently to the formation of the high-level gravels, and consequently at a comparatively recent geological period.—Professor Maskelyne gave a verbal summary of the contents of a paper by himself and Dr. Flight, "On the Character of the Diamantiferous Rock of South Africa." The diamond-bearing matrix had hitherto been an enigma, but the authors have worked out its composition, isolating each mineral constituent, and subjecting it to chemical analysis. The rock consists mainly of enstatite, a variety of bronzite, which is to a great extent altered by hydration. As subsidiary components may be mentioned garnets, ilmenite, and vermiculite. The vermiculite appears to be a new species, described under the name of Vaalite; thus adding another member to the group of vermiculites lately investigated by Professor Cooke. The African rock, whilst approaching in composition to lherzolite or to pseudophite, yet differs

from either of them.—Mr. J. W. Hulke communicated brief abstracts of two technical papers. In one he noticed a Reptilian tibia and humerus, probably of *Hylaeosaurus*, from the Wealden of the Isle of Wight; in the other he described a modified form of Dinosaurian ilium, hitherto reputed to be a scapula, indicative of a new genus, or possibly of a new order of Sauria.

FINE ART.

The China Collector's Pocket Companion. By Mrs. Bury Palliser. (London: Sampson Low & Co., 1874.)

THIS little manual possesses other merits besides portability. It has been compiled by a lady whose acquaintance with every branch of ceramic art is almost unrivalled, and whose statements may be accepted with perfect confidence. In fact, the distinguishing feature of the book is, that authority is given for the occurrence of each mark, and for its being assigned to a particular locality. As most of the references are made to public collections, the amateur is thus furnished with the means of comparing his own specimens with well-authenticated pieces, and can examine for himself not only their marks, but also their forms, fabrique, and style of decoration.

The majolica of Italy and the porcelain and pottery of France have perhaps received the special attention of Mrs. Palliser, but her range of research is a wide one, and we do not think the collector will look in vain for any marks or monograms which admit of identification. Among the marks ascribed to the Bow and Bristol factories are several which will be new to most amateurs; and among those attributed to Derby are two—numbers 43 and 44—which are particularly interesting. We may venture to observe that the workmen's marks upon early Worcester ware are more numerous than the authoress (following Mr. Binns) would seem to think, and that the name Nantgarw is occasionally to be found stencilled in *cursive* characters upon the china of the latter place. We scarcely need add that a more trustworthy and convenient handbook does not exist, and that others besides ourselves will feel grateful to Mrs. Palliser for the care and skill she has bestowed upon it. CHARLES J. ROBINSON.

ROYAL ACADEMY EXHIBITION.

(Fifth Notice.)

VERBAL description of the real landscape, except in the hands of the very greatest writers, is a proverbially tedious thing; even more must be the attempt to paint in words what the artist has painted on canvas. In this branch of art, also, where so much is, as it were, found for him by Nature, success up to a certain point may be often reached without any sure promise that the painter has obtained mastery of his art, or is likely to repeat his achievement. The sphere of a critical notice is, on these accounts, much limited in regard to the landscapes exhibited; and I may, perhaps, do my task best if I begin by defining the chief schools or types of art within which the pictures will be found to fall.

This attempt, however, leads us at once to a few words upon the great and much-debated question, how far the artist should endeavour to imitate Nature: what is his function in regard to her? First, then, whatever theory may require, it is wholly impossible strictly and really to imitate Nature; her gloom and her brilliancy so far outrun

the painter's means that he must either compromise in every tint, or select those phenomena which are least beyond his palette; whilst all effects due to change and motion, of which the most important are the least consciously marked, are forbidden to him. In short, I hope no landscape painter will think me too severe if I compare his task to the attempt to arrange an orchestral symphony for a single flute. The more glory, then, to that delightful art which, with means so limited, has given us results so admirable!

Granting the inevitableness of this intervention on the artist's part, we may now describe landscape painting as *Nature seen through the painter's mind*. What even the most literal, or the most unskilful of men gives us, is always a vision which hung somewhere between himself and reality. The relative distance at which the vision hangs, if I may prolong the simile, together with the mental and manual power of the painter, assign to the work its character and value. This human element is the secret of the artist, which spectators can only hope to discover in part. It will work in many ways, forming endless combinations: in selecting the scene, the time of day, the kind of sky; in determining whether natural tone or natural feature shall be dominant; in omitting, in rearranging, perhaps in composing from scattered material; in prompting the sentiment which the artist wishes to render, whether one strictly "natural," or one representative or suggestive of human emotion. The most impressive landscape will be that which has the nearest resemblance to natural truth (not, necessarily, to one actual scene), united with the most imaginative sentiment. The least, probably, will be that which has only a vague likeness to nature, with signs of feeble imaginative compromise or arrangement on the painter's side. Between these will be a hundred types of landscape, each legitimate, and likely to respond to one of the endless varieties of human taste; but which might be valued by abstract criticism in proportion to their approximation to that style which has at once the most of man and the most of nature.

Among several painters who aim at this highest style, perhaps Mr. Hook and Mr. A. Hunt have made this year the most sustained, the nearest approaches to it. The lovely sea pieces of the former, with his inlands, rarer but not less lovely, have been so long before us, and so much the same for many years, that they need no analysis. The fishermen under the *Lee of a Rock* (29) seems to me the most perfect: the balance between the figures and the view, which has often seemed to present difficulties to the artist, being very happily struck. The colour of the sea is exquisite; no one else combines the real tint with so much freshness and motion. The "clear-obscure" of the Orcadian landscape, noticed by Scott in the *Pirate*, is beautifully given in the *Kelp Burners* (14). As with the sea, so with Mr. Hook's trees in his *Cow-tending* (232): he unites the most venturesome intensity of green with the greatest happiness in natural form. In this latter region he has a rival in Mr. Herbert, who, exhibiting this year in landscape as well as in figures, gives us a very brilliant and charming avenue scene (456), marked by great unity of idea. There is a power of painting in Mr. Hook's work, with a certain *naïveté* in the choice of scene, which, together, place it above the work of Mr. V. Cole, Mr. Leader, Mr. Hulme, or the Linnells. Specimens by these artists are here: the *Heart of Surrey* (11); and a *Morning Scene* (296), by Mr. Cole; an oft-repeated *Weald* by Mr. Linnell (481); *A Torrent*, by Mr. Hulme (1,408): all very pleasing, if not precisely impressive. Mr. Cole's *Mill* (639) is in a much more striking vein; the arrangement of this and the unity of tone reached are excellent. These qualities (which are those, it seems to me, more or less lacking in our good average landscape) reappear in the evening scenes by Mr. C. J. Lewis (1,018); and Mr. Davis (596). The latter, certainly one of the best among our younger

landscapists, is not very forcibly represented this year: the piece, however, just named is an admirable instance of that landscape type in which, without obvious poetic treatment, natural truth is selected and arranged for us by the artist's imagination. The *Sailor's Gardens* (1,379) is another landscape of more than usually clear intention: the tone of the cottages, the scheme of the sky and distance, are fine and true; if Mr. Lloyd be young, he ought to have a career.

Mountain landscape is eminently a province of the art in which the "vision and the faculty" are to be desired. Nature, here seen in her full force as poet, demands poetry from her student. It is only to the imaginative eye that

"The Visions of the hills,
And Souls of lonely places"

will be visible. It is not in this direction, if the view taken in my previous papers be correct, that we must look for success in the two landscapes by Mr. Millais. It is needless to point out, impertinent to praise, the admirable fidelity to natural detail shown in the tree-delineation of the forest-scene (83): the intensely difficult foliage of the fir may, perhaps, have never been more truly and forcibly painted; the underwood is a masterpiece of subtle effect, reached by what look like the simplest means. Why, then, is this work wholly heartless and uninteresting? Why does Mr. Meyer's quiet little evening scene (73), hung above it, look like a picture, in a sense in which this does not? Reverting to the remarks just made, I should reply, because Mr. Millais' piece is as nearly a simple transcript from nature as art can supply; and being thus necessarily compelled to omit much of what was in nature, whilst the artist meanwhile has given us no compensation from his own mind, it is inevitably prosaic: and, in such work, to be prosaic is to fail in art. Why is the "silence of the woods," in reality, so impressive? Not in itself, but because the sense of vivid life in tree and shrub and bird and animal around us gives a mystery and a charm to the contrasting quiet. These things, in part, the painter could not render: what he could suggest he has not suggested; nor by selection, by effect of sky, by any of the artifices, in short, of which a spectator can only note the absence, has he redeemed the deficiency. We may say of this picture, "a fair body, had it but a soul:" the master-mind is wanting as decidedly and palpably as the master-hand is before us.

From any spectator who offers criticism, the ability and the conscientious labour of the painter require that reasons for the criticism, as a matter of due respect to him and to the reader, shall be given. Much of these remarks, whatever be their truth, applies to the *Winter Fuel* (75). Here the child on the waggon, placed so prominently and coloured so conspicuously as to take it wholly out of the mere class of "figures in a landscape," would, in nature, have been the keynote in colour and refinement of form (for what in nature rivals the face and figure?), and also in common human interest. Now, no part here is painted so coarsely as this, or with so little feeling; yet any spectator, I think, can see that, were the figure away, what little unity of composition the picture has (with which, indeed, the confused lines and tints of the tools and lumber before the waggon sadly interfere), would "fall to pieces." Why, on the other hand, is the hill beyond so beautiful? It is not better painted, certainly, than the timber; indeed, as painting, it could not be better: only here we feel the mysterious presence of sentiment: here is the artist's vision: elsewhere, his mirror-like manipulation.

Mr. A. W. Hunt, who has not yet reached this manual mastery, is, however, with no rival in a truly imaginative (and, therefore, an artistically true) rendering of mountains. His two pieces (70 and 1,361) have not a square inch without feeling and interest. In the first, we have a scene such the poet describes:—

"There, where the peal of swelling torrents fills
The sky-roof'd temple of the eternal hills."

Here, the long sky-avenue of wreathing cloud, as in the other the intense sentiment of the worn and aged crags,

"Familiar with forgotten storms,"

may be specified, as two examples of that imaginative insight with which Mr. Hunt is gifted.

If, however, mountain scenery, alone or united with wood and water, requires imagination of a high class before it really yields its secret, on the other hand it supplies so much, that landscape art has no more ready resource for obvious, easy, commonplace effect. Art of a lofty and true kind interprets nature to us: the painter's "vision" gives what a gifted mind sees in a moment, and can then transfer to permanent record. Art of the lower order suggests a scene of which the first and simplest effect would strike everyone; nay, which half a dozen words of description would, more or less, call up. There is much in the Exhibition of this class: the most notable performer being Mr. P. Graham. *Our Northern Walls* (20) and *The Misty Mountain-top* (494) present scenes which hardly render more of nature than is painted in their titles. Mr. Graham's works, with those of a little school of followers whom I need not enumerate, are, in fact, for wild landscape, very much what Mr. Leslie's are for suburban life; and, like them, will never want popularity with that class of minds to which "easy things to understand" are the first and last *sine qua non* of pleasure.

The sea meets with a much greater amount of able interpretation at present than the mountains. Besides Mr. Hook's, we have three pictures, by Messrs. Brett, C. Knight, and Naish, hung together in the Second Gallery (130, 114, 126), each worthy of careful study. These works belong, in varying proportion, to that class where the artist aims less at lending a dominant sentiment, than at faithfully rendering one actual and interesting natural effect. I have already noticed how much—even in work which, like Mr. Brett's, verges on a perilous abnegation of the artist's mind—must really, however, be due to the artist's interpretation; and in these somewhat literal works we can easily trace the presence of this element, although the subtle modes of its introduction are the artist's own secret. Mr. Knight's is, perhaps, the most pleasing whole; Mr. Brett's has a marvellous truth and splendour (no way exaggerated) in the foreground, and the sea lying in emerald and azure between St. Mary's and St. Agnes'; Mr. Naish's has a very powerful rendering of rock and current. But one feels the inevitable limits of landscape art, thus conceived, in Mr. Brett's *Sunset at Bude* (1,012): what is demanded by the artist's own arrangement as the highest point of brilliancy is here a blank.

To Mr. W. H. Moore's *Rough Weather* (1,400) I have before alluded: it is a very fine, though gloomy, square of sea. The forms of wave (if I may risk an opinion on a subject so difficult) are admirably rendered here, as in Mr. Moore's *Cumbrian coast scene* (1,033): only a monotonous key of colour, which often wants the lucidity and splendour of the "blue water," diminishes the interest to which the ability of his work entitles it. M. Thornely sends several coast or harbour scenes (224, 314, 963), also a little monotonous in key and in material, but of much truth and grace: here again one feels that the artist has reached his great look of nature through a thousand subtle interfusions of modest imaginative interpretation. The *Loch*, by Mr. W. B. Morris (1,420), the *Goodwins* of Mr. Wyllie (1,330), the *Brighton Beach* of Mr. Jenner (204), all deserve a more detailed notice than I can give them. The latter, though in a rather opaque style of colour, is very happy in rendering the effect of the golden glow of a summer evening.

The painters whose landscape combines the Fauna with the Flora need not detain us: they have mostly fixed their style (as Messrs. Cooper and Ansdell), or have not yet "arrived." In the last

class I place Mr. Rivière, who has obviously bestowed a labour and study on his *Apollo* and *Lion* (260 and 527) which point rather to promise than, in these instances, to fulfilment. In the *Apollo* the material and the subject have required a much stronger grasp than the artist has yet reached, although many individual points are excellent. The *Lion* is without that force of colour, of light and shade, of grandeur in line, which are wanted to lift an honest study from nature into a picture. There is a very clever wolf-scene from Iceland by Mr. Waller (195); the *Cattle Market*, by M. Poindestre (1,398), is full of animation; Mr. Watson's *Pet of the Common* (813) has something of the refinement and feeling of *Mason*—a name which no lover of art can pass without a sigh of regret and admiration. To the singular ability of Mr. E. Crowe's *Forhounds in Kennel* (1,045) I have already called attention. It has a force and interest that no painter of animals only will ever put into his work: a moral which the history of art abundantly preaches.

Adverting to my opening remarks, let me here add a list, which might easily be extended, of landscape pieces worth notice. In some, general tone has been the artist's aim; in others, special effects of sky, or chiaroscuro, or landscape incident. Such are Mr. Collinson's *Sabbath Day* (38); Mr. Cameron's *Going to the Well* (83); the *Foot-bridge and Hill Side*, by Messrs. Waterlow and Thorburn (180, 181); the *Two Paths*, by Mr. Bates (206), *Moosehold Heath*, by Mr. Elton (251), and *Changing the Pasture*, by Miss Hopkins (302), which I group together, as each presents a very pretty idea; *St. Bennet's Abbey*, by Mr. Bond (306), the distance fine; two meadow scenes by Mr. Luker (398 and 556), excellent in the rendering of levels; Mr. Nesbitt's *Fife Coast* (410); the coast scene in Holland, by Mr. Beavis (545), the figures clever; *Loch Fyne*, by Mr. Cameron (666); Mr. Enfield's *Northerly Breeze* (977), a picture of some power; Mr. A. Stuart-Wortley's *Wharfedale Chase* (987), a very firmly painted winter-scene somewhat in Mr. Millais' manner; Mr. Hole's *Guinevere* (1,021), very pleasing in tone; and an impressive desert view by Mr. Nettleship (1,023), hung too high for study.

In the Water-colour Room let me notice a pretty and natural group by Miss Martineau (739); a brilliant scene on the Teign (Mr. Bearne, 745); another, also brilliant and effective, in the Lake country (Mr. Bedford, 760); a striking view of mountain peaks (Mr. Farren, 790); Mr. J. Hemy's able *Herring Fishery* (898); Mr. Sanderoock's *Summer Noon* (882); Mr. Palmer's view at Cairo (883); and Mr. Dobson's *Nursery Tales* (904), a charming life-size group of two children, in which the great difficulties of water-colour work on this scale are met with much success. In the Ninth Gallery, the "forlorn hope" of miniature is gallantly maintained by Miss Dixon, during the evil days whilst the photograph, that antithesis to art, yet triumphs; Lady Coleridge's pleasing head of Sir W. Boxall (1,217), Mr. Cousins' excellent print from Reynolds's *Age of Innocence* (1,256), of all his lovely children perhaps the loveliest, should be also noticed.

Opposite difficulties to those presented by landscape painting are presented to the reviewer by sculpture. Landscape admits of many small but genuine successes, and many such are here before us. It is a flourishing art in England; endless masterpieces are familiar to every one by way of standards to aid our taste, and there is hence a fair degree of intelligent popular judgment. With sculpture, every one of these conditions is reversed: it is the severest of arts, admitting little between success and failure; success is hence very rare; and standards by which to train public taste (partly through the very nature of sculpture, so unsuitable for frequent exhibition) are rarer still. Very careful study, running everywhere into technical regions, is also needful to decide between

the true and the false in sculpture; whilst the training which helps us to judge of painting is of hardly any use here, painters being, in truth, absolutely the worst judges of sculpture within my experience.* Hence there is no art upon which (and as much abroad as in England) public judgment is so unformed and irrelevant; none in which personal considerations and pernicious clique influence are so potent.

My notice of the present display must therefore be very limited: under the conditions just set forth, an essay would be required to justify and explain a detailed criticism. There is, however, one test to which the present writer has often resorted with success in case of spectators who have thought the opinions he has expressed, in former years, upon sculpture, fanciful or unjustly severe, and which may easily be applied by any visitor to the exhibition. Let him simply ask himself whether the busts which form the majority of the sculpture have the true look of the human countenance. Are they full—not of smooth, vapid roundings, nor of sharp dots and seams and angles—but of delicate curves, which look soft in the lips, tense and firm over the forehead? Do they present a blank uniform pallor when the features are in marble, or a liny, caricaturist look when in clay—or a surface of fine half-tints, full of delicate modulation and changeful *chiaro-scuro*?

These points do not cover questions of style, poetical invention, mode of grouping, and many other elements of sculpture; but they cover one of its first and most constant objects, living and truthful rendering of flesh-surface; and the student who has once learned to feel this, like the student who has learned to admire a great master of style, may know, *se valde proficisse*; and he will find the rest of his path comparatively easy.

Applying these rules, severe from the very nature of sculpture, here, the busts by Mr. Adams-Acton, Mrs. A. R. Hill, Messrs. J. W. Wood, Crittenden, Brodie, Durham, Dalou, and Boehm, with several more, under one or other of the tests enumerated, will fail to "pass the scrutiny." The marble-modelling is generally crude and superficial; the management of the hair heavy. On the other hand, the terra-cotta busts which some of these artists exhibit are unsatisfactory in the main, through exaggerated use of the peculiar qualities of the material: the attempt to give the indescribably refined structure of the human face, and the hair, being here summarily cast aside in favour of a coarse and painful picturesqueness. To try to gain the look of energetic life (the chief aim of the ancient terra-cottists), by grimace and petty tricks of touch, is the besetting temptation of the modeller in this style:—the only very marked example of successful resistance to it which I can find here is in the beautiful little figures by Mr. W. C. Marshall (1524, 1526). These terra-cottas show perfect freedom from the mere devices of the material, and are very graceful in sentiment and in pose.

As specimens to exemplify the qualities which ought to be found in good work, only two conspicuous examples can be named this year (although the grace of Mr. Davis' bust, 1547, deserves notice): the female heads by Messrs. Woolner and Butler (1454, 1464: Vestibule). Mr. Butler's bust shows a dignity and seriousness worthy of his distinguished master in years long past, Mr. Behnes: the management of the drapery and hair deserves careful examination for their grace and genuine sculptural quality. Mr. Woolner's work has those qualities of thoroughness, and fine, truthful finish, without which, as the history of the art abundantly shows, no sculptor can put life into stone!—that task essential to real sculpture, but to name which only is enough to prove its enormous difficulty. Beside the peculiarly sculptural

* The almost curiously bad arrangement of the sculpture-galleries, in regard to light and disposition, is a standing exemplification, only too familiar to our sculptors, of this remark.

grace which flows only from perfect simplicity and sincerity in treatment, this bust has an obvious air of life, of *mobility* as it were, above its neighbours. How has this been reached? If comparison be made, we shall find that the features, in place of the dead flatness common to busts, have a variety of delicate light and shade, a quality of *tone*, which arise from the far greater number of subtle surfaces, corresponding to those of life, which Mr. Woolner has put into his work: whilst the hair, again, is a study of refinement, in contrast with the heavy massiveness which this difficult feature commonly receives.—It is unfortunate for the interests of our sculpture that so able an artist as Mr. Foley is only known now to the Exhibition by his yearly absence.

The medallion-portraits of this exhibition are not powerful; but some grace and refined sense of likeness in this branch are shown by Mr. Wagnmüller and Mr. Joy. The marble work of these artists is, at present, not equal to their clay modelling.

In architectural sculpture may be noted Mr. Forsyth's reliefs for Frome (1434), as rather less antiquarian and conventional (and, therefore, unimpressive) than this style generally is, *e.g.* in the same artist's four designs for Worcester (1489 to 1492). Why does no church decorator, in place of following the fashion which consigns this kind of work to a special class, employ some artist more trained to grace and expression than our architecturalists generally seem to be? Such skill as Mr. F. Miller, for example, displays in his relief from the story of Hero (1442, Vestibule), would surely be well bestowed on a pulpit or altar decoration, and might thus supply work which would interest and arrest spectators, in place of ranking only as archaeological enrichment.

Among Mr. Tinworth's singular terra-cottas, the scene at the *Foot of the Cross* (1468) seems to suit this crowded kind of relief, and the artist's talent, best: it is very clever, though hardly to be classed as sculpture. Mr. Armstead's designs for the façade of the new Colonial Offices, as usual with his work, have much ability, just stopping short of excellence. The action of the figures would, perhaps, be too marked in any style but alto-relief, exposed to our dulling atmospheric influences.

The life-size and poetical figures of the year present little to strike or please. Mr. Noble's seated figure of Her Majesty, though a careful piece of work, does not rise above the "presentation" order. So far as this goes, however, it is better than the ungraceful bust by M. Boehm (1534), whose sculptural style appears to me as unsound and flashy as Mr. Pettie's or Mr. Orchardson's in painting—facile effect and cleverness everywhere doing duty for knowledge and feeling. It must be a matter of true and widely-felt regret that such failures are renewed year by year, in cases where the best ability of the country should be available. But a hundred considerations, in which art has no place, hamper commissions of this character.

French art has fallen off here as much as in the picture galleries. The Opera-house group by M. Carpeaux, with its flutter of wreaths, one can hardly say of draperies, its grins and gesticulations, is, indeed, prodigiously clever. But to be prodigiously clever only, alas! would be the reverse of praise for high-class sculpture. Compared with the Bacchic dances of ancient art, this looks like a mediæval scene of sorcery from the "Mount of Venus": it is the kind of witches' sabbath which might have been witnessed by Tannhäuser. M. Dalou's maternal group of last year raised a hope that he was about to work out and perfect his style of terra-cotta modelling, by adding refinement and elevation to his sense of rustic charm. But in trying to repeat a mother and child of a less homely type, he has missed the pleasingness of his peasant grace, in place of which there is now a tendency to insipidity and affectation. The draperies are also more conventional,

and hence contrast unpleasantly with little bits of crude naturalism, as the collar and the shoes; the type of head has neither the beauty of refinement nor of rusticity. In a word, there is here a great want of *style*; a defect fatal to permanent pleasure in sculpture aiming at sentiment and invention. This will be felt more, should the group reach the stage of marble: with which, also, the manner of the terra-cotta modeller is essentially incongruous. The broad smile which might not offend in the slighter, less pretentious, more merely picturesque clay, when "stereotyped in stone" will be the reverse of charming.

M. Fraikin's group (1496) is a fair specimen of the modern Flemish style; Mr. Leischild's *Wrecked* (1517) is well arranged; Miss Grant's large group (1525) would be effective as a church ornament; Mr. Lynn's *First Prayer* (1525) has grace and naturalness.

Last, let me ask attention to Mr. Bell's model for an heroic group: Wellington on horseback, surrounded by recumbent figures; Peace, Ocean, Spain, and Portugal, if I read them rightly (1588). Of course the test of success in such a work is only to be found when it is executed on the full scale; but, so far as a model enables one to form an opinion, Mr. Bell's is both original and powerful in idea and in design. Like this able artist's work in general, every part here is thought out well, and well arranged. In an exhibition where the laws of sculptural style, eternal and immutable, because evolved from the technical conditions of the art,—are so much set at nought, an example of this class is of high value.

In concluding the invidious and reluctantly-undertaken task of attempting to estimate this vast treasure-house of contemporary art, the writer entertains a hope that his criticisms, if they be correct, will be found to support the remark which the first sight of the exhibition led him to form—that it was one which, in many directions, affords a very satisfactory impression of the state of painting among us. Five or six pictures, such as those by Mr. Lewis for perfect technical quality, Mr. Maclaren's for grace of line, Mr. Fildes' for force of sentiment, with those by MM. Israels and Legros, among us, if not of us,—I may perhaps add Miss Thompson's for felicity of idea,—would alone stamp a year's collection, whether here or abroad. And if anywhere, in the odious task of adverse remark, I have seemed too severe, I would beg to submit in extenuation, that my attempt has been throughout to estimate the work exhibited, not by the popular favour of the moment, but by that higher standard which the English school, for a century and more, has established among us. F. T. PALGRAVE.

EXHIBITION OF MR. WHISTLER'S PICTURES.

AN artist who retires from the popular exhibitions, and shows his work apart in a gallery of his own, takes a course of which it is hard to balance the good and evil. On the side of evil there is always this to be apprehended—that his work, once withdrawn from the open field of comparison and rivalry, once secluded into an atmosphere of its own, will take a growing development on that side on which it is least like the work of other men. Does it contain the germs of singularity or affectation, these germs will produce and multiply a hundredfold; the talent of the recluse will lose whatever chance it has had of becoming central, sane, or complete. If the popular appreciation of art was quick, if the atmosphere of our great annual shows was really a healthy and bracing atmosphere, considerations like these would, I think, turn the scale decisively against the practice of private exhibition. But the excuse for private exhibition is that our great annual shows, in the present state of public taste, do not really provide a genial element for works of art; that what makes most figure there is work of such commonplace, misdirected, unpleasurable kind as has little right to be called art at all; and that the same

traditions which cause work of this kind to prevail, often cause grave injustice to be done to work answering to truer instincts. If there is any case in which an artist is justified in opening a gallery of his own, it is when he is conscious of a distinct vocation for certain kinds of artistic combinations which it takes delicate organs to appreciate, and when experience has taught him that this kind of combination receives scanty welcome at the hands of art's official censors. And this is Mr. Whistler's case. There is another concomitant temptation of private exhibitions, that of turning them into a kind of raree-show, and seeking to attract public notice to the speculation by vulgar excesses of proclamation and placard. This temptation has not led Mr. Whistler away. His little gallery, opened last Monday at No. 48 Pall Mall, needs to be looked for; and when you have found it, you encounter none of the inopportune arrangements of certain well-known galleries in Bond Street. You find a room pleasantly muted, tinted and arranged; with a panelled skirting carrying two tiers of the artist's works, a lower tier of colour sketches, and an upper tier of etchings, and above the skirting some eight or ten oil paintings in quiet keys of colour.

That Mr. Whistler is an artist having a distinct vocation stands acknowledged. To produce a peculiar order of delicate arrangements and harmonious pattern of colour, in the representation whether of individual sitters or fancy groups or landscape; to carry out the pattern-making part of his intention to as subtle and complete a point as possible, and to stop very short with the representing or realising part; to do this at a single painting, with the distinctness and purity of effect which can be secured only by avoiding all repetitions or complications of the brush; these may be set down as the heads of the mission which Mr. Whistler feels himself inspired to fulfil. And as of all harmonious and spirited pattern-makers the Japanese race stands infinitely the foremost, so it is in the art of Japan that Mr. Whistler finds his closest precedent. Only, while Mr. Whistler forswears those imitative effects of relief, definition, fulness of natural light and shadow, which go to make up the European conception of a picture, he is scarcely master, on the other hand, of that genius for expressive abstraction, that incisive certainty of selection, that intense way of telling much in little, which makes good Japanese work as pregnant for the imagination as it is flattering to the sense. What the art of Mr. Whistler yields is a *tertium quid*, somewhat vague, pale, and incomplete, as I should say, beside really first-rate work done on either the European or the Oriental principle—a product both refined and artistic, but carrying refinement to a pitch almost sensational, and pushing a single artistic principle to the verge of affectation.

The catalogue of the exhibition being not yet issued, it is difficult to refer to individual works. Of the portraits in oil, that of the artist's mother, exhibited two years ago at the Royal Academy, seems to me still the best. The mourning tones of black, grey, and white, with an admixture at most of the demurest yellow, which the exigencies of modern costume seem to the artist to prescribe for portraits in general—these tones have a peculiar imaginative appropriateness in this case; and to renew acquaintance with the work is to revive more than all the first impression of it. A seated portrait of Mr. Carlyle is treated in the same key, and is admirable in the disposition of the figure and in the luminous quality maintained through all these sombre tints; but the head seems to me too much softened in form and too much extinct in fire. How much of this look of weakness is due to the constraint of the artist's principles of work, it is hard to tell: that it can scarcely be due to want of power in grasping character, would seem to be proved by several of the etchings which surround the walls at the height of the eye. Of these, with their strange mixture of scampering

caprice and singularly direct and concentrated power, we have not space to speak in detail. The views of the Thames have been already published; of the unpublished prints, some half a dozen portraits of young girls, done with the dry point, are altogether exquisite, and show a charm as well as a vividness and address which to my mind put them at the head of all Mr. Whistler's engraved work. The same qualities occur in a brilliant degree in some of the studies on the lowest tier. These are chiefly done on brown paper, with pencil, chalk, or colour, and contain a few fine landscape and sky effects, several sketchings of portrait, and some abrupt jottings in lovely colour for figure compositions of a Japanese fancy. Mr. Whistler has long been engaged in working up compositions of this kind into pictures: two or three half-way hints in oil towards such pictures find their place already upon the walls of this gallery among the portraits. In course of time, we understand, the portraits will be displaced to make room for a more variegated show.

SIDNEY COLVIN.

PRIZES AT THE "SALON."

Paris: June 1, 1874.

THE award of medals for painting, sculpture, architecture, and engraving has given rise to characteristic incidents. At first sight, one is disturbed at the progress in the path of reaction of a clique hitherto self-recruited from year to year; but, after closer examination, one is fain to conclude that the excesses of the jury have at last killed it; and that it is impossible for the administration, even if it does not permit artists henceforward freely to regulate their own exhibitions, to avoid modifying an institution which recalls the disastrous days of the Empire.

But I will let the facts speak for themselves. There were first, second, and third class medals to be awarded. The jury is composed of a few amateurs appointed by the administration, and of members elected solely by artists who are either members of the Institute, old winners of the *prix de Rome*, or who have received the decoration of the Legion of Honour, or a medal at a previous exhibition. It will be easily understood that this aristocracy, jealous of the advantages of its position, thinks first of its pupils and next of its friends. It gathers information about those who are personally unknown to it, and only allows the electoral body to be swelled by safe men, who can give pledges to "moral order." Never yet was the result so conclusive: sculpture only carries off two medals, which are both awarded to pupils of the School of Rome—one very properly to M. Noël, author of a *Gladiator casting his Net*, a correct figure; the other to M. Lafrance, for a little *St. John the Baptist*, a study of a child as crooked as Quasimodo in *Notre Dame de Paris* must have been when taken up by Claude Frolo, which only deserved a third-class medal.

Painting has secured three first-class medals. One is awarded to M. Blanchard, pupil of M. Cabanel, for a *Hylas carried off by the Nymphs*; the second to M. Lehoux, pupil of M. Cabanel, for a *St. Lawrence*, roasting painfully on his gridiron, without asking, like Montezuma, to be turned; the third to M. Priou, pupil of M. Cabanel, for a *Family of Satyr*, who are as black as a family of colliers.

The second-class medals are thus awarded:—One to M. P. Billet, pupil of M. Breton, member of the jury; one to M. Brissot, pupil of M. Fromentin, member of the jury; one to M. Ponsan, pupil of M. Cabanel, member of the jury; four to pupils of Gleyre, who is dead and can give no more trouble; one each to a pupil of M. Picot, and an artist who states that he studied under no master; three to foreigners, M. Castres of Geneva, M. Hennebicq, a Belgian, and a Hungarian, M. Munkaksy.

Landscape, which plays so great a part in the

contemporary movement, has only received one second-class medal, awarded to M. Guillemet, who specifies his debt to no master, but must have received advice from that very skilful painter of still life, M. Vollon, member of the jury; he has painted with a clear and powerful eye for effect a *View of Paris from Bercy*, where the Seine enters the city. Then a third-class medal is awarded to M. Karl Daubigny, son of the excellent landscape painter, Charles Daubigny, who, after beginning by closely imitating his father, shows more individuality this year, in his *Saint-Siméon Farm at Honfleur*. Another to the Marquis de Groiselliez, for a conscientious study, *The Old Cottage*; one to M. L'hermite, pupil of that learned master M. Lecocq de Boisbaudron, from whose studio have come A. Legros, Fantin, Solon, and others; one to M. A. Detaux, private study, for an energetic study in the Forest of Fontainebleau, representing birch-trees attacked by woodcutters; and, lastly, one to a Belgian, M. Mols.

If we continued to follow the award of medals, we should find the studios of Cabanel, Pils, and Gérôme triumphant, not, as might be imagined, for austere art, for striving after perfection in drawing and tone, but for the most vulgar *genre*. These three artists are official professors, with diplomas and patents, at the Ecole des Beaux-Arts. Therefore the whole generation will be compelled to pass through their three studios; such students at least as are not ambitious of a glorious death by starvation. All the old studios, which were rivals, and consequently full of energy, are now closed or deserted: P. de la Roche, Picot, Drolling, Léon Cogniet, Gleyre, Yvon, Robert Fleury, and the rest. It is impossible to reconstitute new studios in the face of the competition of the State. Hence it may be seen what kind of variety our Salons will shortly present, for the spirit which presided over the distribution of medals to the point of rejecting the claims of lady artists (poor ladies!) on principle, had already made itself felt in the hanging by the rough rejection of two highly original paintings by M. E. Manet, and of all that might betray any sacrifice to a novel interpretation of nature.

But to proceed: the day after these awards, a special jury, composed of the four sectional presidents, and two members of each section chosen by lot, had to award two great medals of the value of 4,000 francs, the prize works to have the further honour of being engraved at the cost of the Government. At the first ballot, the name of the young sculptor Mercié at once came out successful. He was the laureate of public opinion. No work, either in point of thought, of execution, or of appropriateness, can vie with his *Glory*, descending, and taking on her shoulder the corpse of a young vanquished warrior, who has fallen sword in hand, proudly spurning the ground, and seeming to fly far away to those regions of light, where undeserved defeat is no longer accounted a disgrace.

But as regards painting the case was different. The Salon contains none of those striking works which win men's suffrages even while calling forth passionate opposition. M. Bonnat's *Christ on the Cross* had been spoken of. But men of taste had revolted against the vulgarity of the imitation, the bad quality of the painting, the puerile prominence of muscles, veins, and nerves, the repulsive coarseness of the lower limbs. Somebody said it was the impenitent thief! Others had suggested *The Cliff*, by M. Jules Breton, a peasant girl on the coast of Brittany, lying flat on the grass, and gazing on the sea, which is lashing the base of a perpendicular cliff. But it was generally admitted that the artist had lost his effect by displaying it on so large a canvas; that the painter, when he makes *genre* painting pass from its ordinary dimensions to such a scale as this, must add the charms which elements of grand design and fine painting can bestow, like Courbet and Millet. Besides, M. Jules Breton and M. Bonnat had

already had the great medal of honour, or M. Carolus Duran might have put in a claim for his fine portrait of the Marquise de Pourtalès, and M. Henner. Other classical candidates might have come forward. But it was thought that to avoid a choice never completely ratified by public opinion, as well as to pay a tribute of respect to a style of work at once classical and popular, represented in the past by a thousand attractive and poetical compositions, and in the present Salon by two pictures of the first rank, *Moonlight* and a *Spring Landscape in the Department of the Nord*, the jury would award the medal of honour to M. Corot. M. Corot has attained the age of seventy-eight. Never has the life of man afforded an example of more virtues—labour, science, a long struggle, fidelity to principle, good advice to beginners, modesty, an unchanging cheerfulness of mind and heart, charity inexhaustible now that Fortune visits his studio which she has so long despised. M. Corot is the type of the French artist in the most loyal and most attractive features of the French character.

What was the surprise of the public on learning that, after six laborious ballotings, the votes were thus divided: M. Gérôme, seven votes; M. Corot, three votes; M. Henner, two votes. One paper was left blank throughout. M. T. P. Laurens, painter of an excellent *St. Bruno refusing the Presents of the Count of Calabria*, and M. Matejko, of Vienna, author of *Balthor, King of Poland, before Pskow*, had received one vote each.

The news appeared so extraordinary, so compromising to M. Gérôme, who was absent on a tour in Belgium, that his friends spread a report that he would not accept the honour. He has accepted it. He could not do otherwise. His contributions, however, seemed in no wise to demand such a distinction. I cannot help thinking for my own part, and many critics are of my opinion, that M. Gérôme's drawing is mean, and his colouring false and heavy. But these are only personal impressions, and therefore open to discussion. It is beyond dispute that his interpretation of history is as puerile as it is inaccurate. It is not historical *genre*, but anecdotal *genre*, as weak in conception as the mythology that is danced and sung on the stage of Offenbach. This painting has its reward in itself—pecuniary success. It needs no supreme honours like the work of artists who strive with all their might for the expression of an ideal, whether this ideal be the human figure in its plastic beauty, in its passions, in its allegorical or fabulous disguises, or whether it be landscape, that is, Nature in its conditions of outward harmony or of deep inward significance. M. Gérôme does not even show the research which his master, Paul de la Roche, brought to the portraiture of historical types. In his picture entitled *Une Collaboration*, Molière has his head sunk in his chest, like a hunchback, and Corneille's profile recalls the hooked face of an old German broker. The *Rex Tibicen*, that is, the Great Frederick, playing frantically on the flute in a little room full of wood-carvings of greyhounds, would cut but a poor figure among the nervous and living sketches with which Menzel has enriched his admirable *Life of Frederick II.* The "Eminence grise," Père Joseph, the Capucin, and Richelieu's famous agent, would not have endured the courtiers bowing so low as he passed. That is only seen when the king in an extravagant move amid his oafish court. The dulness of courtiers is in their hearts and their glances, much more than in their faces and their backbones. It is a troupe of valets going to a masquerade that M. Gérôme has here grouped, and that in a way most indecorous to public taste. After showing us antiquity in a burlesque or unbecoming episode, the *Angus Meeting*, or *Phryne before the Areopagus*, M. Gérôme seems to wish to attack modern history. It is a pity that the jury should have encouraged him in this attempt. But M. Gérôme is a member of the Institute,

Professor at the Ecole des Beaux-Arts, a very excellent man in his private capacity, and son-in-law of the wealthiest of our modern print-sellers and picture-dealers.

It is only universal suffrage applied to the nomination of the jury, that is, the right to a vote recognised in every artist whose pictures have been accepted at an exhibition, and who has thus become, so to speak, a member of the corporation, that can prevent the recurrence of equally culpable mistakes, restore energy and confidence to beginners, and give back to France her lost originality and influence. The Director of the Fine Arts has just had a conclusive experience of this. M. de Chennevières proposed a scheme for the "prix de Salon." The jury of the section of painting was to name the work which in its judgment afforded the highest promise of great painting. The prizeman, who must be under thirty-two years of age, was to receive at Rome an exhibition of 4,000 francs for three years. He was to send a copy of a master named, and afterwards a composition of two figures on a given subject.

The scheme, which was often proposed under the Empire, is good in itself, but not in its authoritative limitations. It too distinctly competes with the "Ecole de Rome." The latter has its sufficient reason for existence. No one has any serious idea of destroying it: at most, some of its statutes might be remodelled. It is evident that in a country so accustomed to centralisation as France, so convinced of the impeccability of the central power, the State, which is charged with the distribution of great decorative works over the whole surface of the country, must have ready to its hand a whole squad of artists, broken in to the practice of programmes, nourished with the milk of tradition, skilful in avoiding those audacities of design, colouring, and composition which make the Philistines hoot like owls. I see in the list of works executed in the Department of Public Monuments which is printed at the end of the catalogue of the Salon, Gas and Paving, in the pediment of the proscenium at the new Opera-house. Who could render Gas and Paving in sculpture, unless he had made a special study of official symbolism? And can Carpentry and Trenching, which come further on, be said to appeal to the imagination? Can you think of all the competitions a man must have gone through, to render Paving, Gas, Carpentry and Trenching worthy of figuring gracefully in the proscenium of an Opera?

Yet we possess artists at our disposal who extricate themselves with a degree of success that does them credit from these formidable pleasantries. Let us not trouble them. Their work is made up of painstaking efforts, of lost illusions, of vexations borne with dignity. But besides these modest characters, forming as it were the main body of an army, we must also learn to maintain some impatient of rules, adventurous, always far to the front or on the flanks of the regiment. The Salon is an excellent occasion to recognise such as these. Ensure them an income which will allow them to travel wherever the wings of their fancy may carry them—in Italy, Spain, Belgium, England, Japan, if they will. True, the copy or picture that they may send home will not compensate the State in money value; but France will be far better enriched by the free development of their individual talent.

Perhaps had the question been put in this form, the jury would have reflected on its really novel and patriotic aspects. Unluckily the jury only saw in the decree, hastily signed by the Minister at the instance of M. de Chennevières, a competition with the "prix de Rome," and, being composed of members of the Institute and friends and clients of these members, it rejected the proposal by a majority of 11 to 3.

At the present moment no fresh solution has been arrived at. Will the Director accept this adverse decision, and renounce his "Prix de Salon," or will he ask the Minister to form a new jury?

We cannot answer the question. In the first case he is left in a delicate position: nothing would be more deplorable than to see a man so distinguished as M. de Chennevières, and animated with such good intentions—though he is sometimes too hasty, and mixes his Liberalism with concessions to Bumbledom—leave a position which he is more worthy, and better qualified to fill, than any of his contemporaries. In the second case, he may save all by getting rid of this peevish and aristocratic jury, and appealing to the vote of all the artists exhibiting.

PH. BURY.

ART SALES.

THE sale of Mr. Barker's fine collection of pictures of the Italian schools took place at Christie's on Saturday last, and the following prices were obtained. Lot 11. J. B. Pater, *Blind Man's Buff*, a composition of seventeen figures, 536*l.* (Brooks). Lot 12. *A Fête Champêtre*, a composition of seven figures, 157*l.* (Wells). Lot 18. Sasso Ferrato, *The Madonna and Infant Saviour*, 420*l.* Lot 20. School of Boucher—A set of eight upright panels, each painted with two subjects of children in colours and a landscape in blue, with borders of flowers in colours, in carved and gilt frames, and another panel to correspond; from the late Earl of Pembroke's collection, and executed for Madame de Pompadour's Château at Crécy, 6,352*l.* (Wertheimer). Lot 23. H. Himmelinck (Hans Memling), *The Madonna and Child enthroned*, with St. Catherine and St. Margaret, angels, &c., 1,312*l.* Lot 35. Giorgione (?), Portrait of the Artist's Mistress, 300*l.* (Graves). Lot 37. Giovanni Bellini, *The Madonna and Infant Saviour, attended by St. Peter and St. Helena*, half-length figures, purchased by Mr. Barker from the Manfrini gallery, Venice, 756*l.* (M. Grüner, from Dresden). Lot 38. Giorgione (?), a landscape, with Borso d'Este and Lucrezia Borgia, 600*l.* (Grüner). Lot 39. Domenico Ghirlandaio, an altar-piece, *Madonna and Child enthroned*, with angels, St. John and St. Bonaventura, St. Francis and St. Catherine, from the Blades collection, 367*l.* (Marquis of Bath). Lot 42. Filippino Lippi (?), *The Adoration of the Magi*, 735*l.* (Calvetti). Lot 43. Francesco Ubertini, called Il Bachiacca, Portrait of a Youth playing a guitar, 262*l.* (Broadhurst). Lot 44. Fra Filippo Lippi, *The Adoration of the Magi*, 316*l.* Lot 45. Gentile da Fabriano, *The Madonna and Infant Saviour*, 300*l.* (Grüner). Lot 46. School of Mantegna, *Clelia crossing the Tiber from the Camp of Corsena*, 190*l.* 10*s.* (Bath). Lot 47. Dosso Dossi, *St. Catherine and St. Lucia*, 136*l.* 10*s.* (Bath). Lot 48. Fra Filippo Lippi, *The Madonna, Infant Saviour, Magdalene, and St. Catherine*, 504*l.* (Gullich). Lot 49. Vivarini, *The Madonna and Infant Saviour*, 180*l.* (Burton). Lot 52. Raffaello (?), Portrait of a Youth, 390*l.* (Broadhurst). Lot 54. Cosimo Tura, *The Madonna*, 84*l.* (Burton). Lot 56. Andrea Priviale, *The Madonna, Infant Saviour, and St. John*, signed and dated 1510, 893*l.* (Grüner). Lot 57. Benvenuto di Siena, *The Madonna and Infant Saviour*, in a rich dress with jewels, 525*l.* (Burton). Lot 58. Francesco Francia, *The Madonna, Infant Christ, and St. John*, circle, 682*l.* (Brooks). Lots 61 and 62. Carlo Crivelli, Six Saints in niches, 566*l.* (Mithke). Lot 63. Crivelli, *St. Catherine and the Magdalene*, a pair, 210*l.* (Burton). Lot 64. Crivelli, *The Madonna in Ecstasy*, signed "Caroli Chivelli Veneti Militis Pinxit, 1492." From the Chapel of the Malatesta in the Church of San Francisco, at Rimini, 577*l.* (Burton). Lot 65. Antonio Pollaiuolo, *The Madonna and Infant Saviour*, 693*l.* (Castellani). Lot 70. Pietro della Francesca, *The Nativity*, 2,415*l.* (Burton). Lot 71. Luca Signorelli, *The Story of Coriolanus*, 483*l.* (Ley-

* It will be seen by an announcement in another column that the question has since been settled in favour of M. Lehoux.

land). Lot 72. *Ib. The Triumph of Chastity*; Cupid bound by a troop of young maidens; a fresco transferred from a wall to canvas, 840*l.* (Burton). Lots 73 to 79 are all by Lorenzo di Credi, viz., Lot 73. *The Madonna, Infant Saviour, and St. John*, 325*l.* (Coope). Lot 74. *The Madonna and Infant*, 315*l.* Lot 76. *The Madonna, &c.* 483*l.* (Grüner). Lot 79. An altarpiece, *The Madonna, Saviour*, with St. Sebastian and St. John, 483*l.*—(Grüner). Lot 80. Luca Signorelli, *St. George and the Dragon*, 252*l.* (Broadhurst). Lot 81. *Ib. The Madonna*, kneeling in prayer over the infant Saviour, with an open book, 450*l.* (Street). Lots 82 to 87, all by Bernardino Pinturicchio—viz., Lot 82, a curious long panel, 152*l.* (Marquis of Bath). Lot 83, the companion, representing a camp scene, 162*l.* (Bath). Lots 85 to 89 were all bought by Mr. Burton, viz., Lot 84. *The Return of Ulysses to Penelope*, 2,152*l.* Lot 85. *The Story of Griselda*, 210*l.* Lot 86. The same story, 241*l.* Lot 87. The same, 273*l.* Lot 88. Sandro Botticelli, *Mars and Venus, reclining with Cupids*, purchased at Florence, 1,050*l.* Lot 89. *Ibid.*, *Venus reclining*, in a landscape, with three amorini pelting her with roses, 1,527*l.* Lots 90 to 97 are all by Botticelli. Lot 90. Portrait of the artist's wife in profile, life-size, and an allegorical figure on the reverse, 230*l.* (Samuel). Lot 91. *The Madonna embracing the Infant Saviour*, with St. John in adoration, 1,680*l.* (Brooks). Lot 92. *The Story of Nastagio degli Onesti*, 997*l.* Lot 93. *The Marriage Feast of the Fair Daughter of Paolo di Traversero*, 682*l.* Lot 94. An illustration to Boccaccio, 420*l.* Lot 95. The companion, 420*l.* Lot 96. Another illustration, 525*l.* Lot 97. The companion, 525*l.* The last six lots were bought by Mr. Broadhurst.

The ninety-four pictures realised 37,200*l.*, and the Government purchases, thirteen in number, amounted in all to close upon 10,000*l.* The sale was attended by the representatives of several other Governments; but few purchases were made except (what seems to us of more than doubtful discretion) that of some of the Manfrini pictures of Venetian masters on behalf of the Dresden gallery.

It is apparent that the new Director of the National Gallery, Mr. F. W. Burton, has turned to excellent account the opportunity furnished by this sale of enriching our own collection with works of those most rare and delightful Italian masters who preceded and taught the great group of the *Cinquecento*. If any criticisms were to be made against the spirited and discreet choice of purchases effected for the nation, they might be: first, that two examples at least of singular purity and beauty had been allowed to pass into other hands, viz., the Pollaiuolo bought by Signor A. Castellani (lot 65), and the Madonna of Botticelli (lot 91), bought by Mr. Broadhurst; and second, that these might profitably have been acquired in the place of two works of a master in whom the National Gallery is already singularly rich—we mean Carlo Crivelli. If further specimens of Crivelli were to be added from Mr. Barker's collection, we should have been disposed to prefer the pair of predella panels (lots 61 and 62), as better preserved, and better illustrating his most poignant and dramatic quality, than the two lots 63 and 64 actually purchased, notwithstanding their scale and importance. Of minor acquisitions, the small examples of Cosimo Tura and Vivarini were undeniably judicious. Of the greater purchases, none has more interest than the round of the Nativity purchased by Mr. Barker from the Marini Franceschi family in Florence. This example of Piero della Francesca di Borgo San Sepolero, one of the rarest and greatest of reforming masters in the *quattrocento*, has undergone a certain amount both of decay and repair. It represents the Virgin kneeling before her child, who is placed on the ground in front of the manger: Joseph is sitting by; and a group of six angels, exquisite both for severity of design and dignity of sentiment, stand facing the spectator, and playing on musical instruments. The

expression used by the editors of Vasari in 1848 is: "the beauty of this painting makes us all the more lament the loss of freshness and transparency in its colour." And Messrs. Crowe and Cavalcaselle, writing after the restoration, say: "this piece is injured in colour, and seems to have remained unfinished. It is painted with much impasto and of a brown tone." It needs no extraordinary knowledge to be assured that with the spirit and expression of the work restoration has scarcely interfered. The unfinished parts in the background and the face of one shepherd have been left incomplete: and the work, whatever it may have suffered, remains a singularly beautiful and characteristic example of Italian religious art under the nascent influence of classicism and naturalism, and a worthy companion to the noble *Baptism* of the same hand which we possess already. The remainder of the purchases illustrate, as they were not illustrated before in our national collection, the secular or classical spirit of Tuscan and Umbrian art in the hands of the great precursors. The fresco of *Ulysses and Penelope* by Pinturicchio, and the fresco of *The Triumph of Chastity* by Signorelli, are both acquisitions of infinite value, the one in a tender and the other in a passionate fancy, and equally lovely in colour. They are two out of a decorative series painted (probably in 1509) for the house of Pandolfo Petrucci at Siena, and were removed, together with a third (the *Coriolanus* of Signorelli, bought by Mr. Leyland) to the collection of M. Joly de Bammerville in 1844. A certain amount of injury and retouching, consequent upon the transfer from wall to canvas, does not very seriously detract from their characteristic beauty. The whole series is carefully described by the editors of the *Lemonnier Vasari*. There remain the *Griselda* series of Pinturicchio, and the interesting classical pieces of Botticelli (lots 88 and 89)—the *Venus* with *Mars* and *Cupids* exhibited a few years ago at South Kensington, and the *Venus* with *Cupids*, both of them nearly life size and of remarkable charm, though in the latter there is a *naïveté* bordering upon ugliness, in the action of the amorino who stretches one straight arm across the recumbent figure of *Venus*, and with the other has an awkward grasp of her dress. On the whole, therefore, and with the possible animadversions we have indicated, the nation is to be warmly congratulated on the choice made for it out of a collection containing much that was unique in its kind, together with more that was misnamed or had lost all value from the effects of time and tampering. We should add that four out of the above purchases are already displayed on the walls of the Gallery.

NOTES AND NEWS.

MADAME BODICHON has had on view for some days, at her house, No. 5 Blandford Square, a considerable number of her water-colour paintings, Algerian, and other subjects. No less than one hundred and four examples have been thus collected. The remarkable artistic gifts of this lady, evidenced in so many exhibitions of past years, were never displayed more advantageously or conclusively than in the present gathering. She possesses in a high degree the faculty (than which none is of loftier import to the landscape painter) of seeing what the scenery looks like *as a whole*; and her constant aim, in the process of realization and execution, is that of educing this general impression, so as to make it clear and forcible to the spectator. On attaining this object she is satisfied, and has indeed a right to be so: yet, in many instances, she carries her subject well forward in point of executive completeness and detail as well. Slight or full-wrought, her work continually *grasps* the subject with mind, eye, and hand. Among the pictures recently displayed, those from English scenery, and especially from the sea near Hastings, were perhaps even more observable than those from Algeria: a large view of *The Rapids above Niagara* is also

uncommonly fine, and a highly arduous attempt. We may cite the following subjects as some of the most important in scale and treatment:—*Water Tower near Algiers, Winter; View from the Telegraph Hill; Gorge of the Chiffa; In the Cedar Forest of Teniet-el-had; Sea, Hastings* (almost rivalling Mr. Henry Moore in well-applied perception). Also the following as particularly able and successful, on a smaller or less elaborate scale:—*Reeds near the Sea; Roman Aqueduct near Cherrich; Sunrise, Fish-Market, Hastings; After a Storm, looking West, St. Leonard's-on-Sea; Sea and Mist; Mist; Rye, Sussex; Sunrise, Summer; On the Thames; Dirty Weather*. We may take the opportunity of observing that M^{me}. Bodichon is not the only lady who has of late years turned her Algerian experiences to good artistic account. We were recently very much gratified by inspecting a series of Algerian sketches made by Miss Miller, the daughter of a gentleman in Liverpool well-known in connexion with art matters. These deal more with the life and aspect of the population than M^{me}. Bodichon's paintings are wont to do, and they are full of rapid seizing of character and effect.

MR. C. T. NEWTON, of the British Museum, whose deep and special knowledge of antique sculpture makes anything he may write on the subject of the greatest value, has contributed an interesting history and description of the Greek sculptures from the west coast of Asia Minor in the British Museum, to the June number of the *Portfolio*. A large photograph is given of the metope found by Dr. Schliemann at Ilium Novum, representing Helios driving the chariot of the Sun; but Mr. Newton defers his notice of this work to his next article, in which he proposes to deal with the later Greek sculptures of Asia Minor. M. O. Rayet, writing on this metope in the *Gazette des Beaux-Arts*, unhesitatingly assigned the temple from which it was taken to the reign of Lysimachus (323-282). We are curious to learn whether Mr. Newton will agree to this date.

The other articles in the *Portfolio* are the usual National Gallery notice and picture—this time a fine etching by Rajon of Velasquez's portrait of Philip IV.; the continuation of the "Sylvan Year;" and a description of Romney Marsh and its surroundings, by Basil Champneys.

THE Paris papers announce that the artists of that city, with a view to protesting against the decisions of the academical juries of late years, have decided that a subscription shall be opened, having for its object the presentation of a *medaille d'honneur* to M. Corot, and already, notwithstanding that the promoters of this idea have not had recourse to the publicity of the press, it counts more than 400 adherents. Next week the subscribers are to meet to nominate a committee charged with the execution of the medal. A crown of laurels, the number of leaves in which coincide with the number of working years of the painter's life, will accompany the gift.

WE understand that Sir Gilbert Scott is about to undertake some alterations in the interior of Durham Cathedral. He proposes to erect a very open choir-screen, and to re-arrange the stalls so that the back row shall be brought in front of the piers, instead of being between them, as is now the case. Their present position dates only from about the year 1845, when the Jacobean organ-screen was removed. The organ will probably be divided, and placed in the two opposite arches of the westernmost bay in the choir. The old stall ends—very rich and interesting examples of the carving of Charles I.'s time—are to be retained, a conservative measure which we hope will be imitated elsewhere. The prejudice against everything that is not Gothic has already cost us too many of these valuable post-Reformation fittings. Sir Gilbert also proposes to lay the choir with a marble pavement in what may be called the Italian fashion.

JEAN LOUIS HAMON, the French painter, is dead. He was born at Plouha, in 1821, and was a pupil of Paul Delaroche and the late M. Gleyre. It was not till he was attached to the porcelain manufactory at Sèvres that he came into notice. Every one knows his graceful little picture *Ma Sœur n'y est pas*, his *Doll*, and his *Réverie*, which were in the Great Exhibition of 1851—charming little subjects, treated after the manner of the antique.

THE prize of the Salon of 1874 has been awarded to M. Pierre-Adrien-Pascal Lehoux by a majority of votes on the first ballot. M. Lehoux was born at Paris in 1844.

THE Exhibition at the Corps Législatif is to close on the 15th instant, and will reopen on the 22nd, when an almost entirely different set of objects will be exhibited.

It is stated that Mr. W. W. Story has just completed a statue of *Alkestis*, which is one of the sculptor's most successful works. The moment selected is that when the Queen of Phærae has but just returned to earth from her sojourn in Hades, and the expression of semi-consciousness on her face, and of doubt and bewilderment in her pose and figure, is said to be admirably rendered.

THE question of the proprietorship of the Schliemann treasures will, it is reported at Athens, be referred to the courts of law, and as a preliminary required by the Bavarian code, still in force in regard to claims on property, a comprehensive list of all the articles in dispute has been drawn up. From this we learn that his collection consists of 12,711 individual pieces, without counting the small fragments or other objects, which occur in large quantities or great numbers. There are 180 bones and pieces of ivory; 2,601 terra-cotta and clay objects; 779 figures in marble or stone; and 9,151 objects in various metals, including gold and silver, of which, among other articles, we may instance, in silver, 2 needles, 6 bracelets, 3 rings, 10 cups or other drinking vessels; and in gold, 1 knife, 1 coronet, 6 bracelets, 2 rings, 68 earrings or pendants. There are also 8,700 beads of various kinds; and 2 beakers and 5 ear-rings of amber.

A MEDAL, designed by M. J. C. Chaplain, has been struck in France to commemorate the siege of Paris. On the face of the medal is represented the city of Paris personified by a powerful woman wrapped in a military cloak, standing with a gun in her hands, leaning against the fortifications, a cannon at her feet. On the reverse is the monument commemorative of Champigny, around which are inscribed the names and dates of the five battles that took place before Paris. Beneath are simply the words, "Siège de Paris, 1870-1871."

THE *Chronique* contradicts the report that the painter Tassaert, whose death we recorded some weeks ago, died in indigent circumstances. He had, it seems, an income of 1,000 fr., besides a pension of 600 fr. from the Society of Painters. It is more probable, therefore, that the poor old man (he was over eighty) fell asleep and got suffocated accidentally from the fumes of charcoal, than that he committed suicide in despair and want, as the papers at first stated. The Society of Artistes-Peintres are going to raise a monument over his grave.

THE first French exhibition in black and white will be opened in July next, in the galleries of the journal *Paris à l'Eau-forte*. Works intended for this exhibition should be sent in before June 20.

THE city of Boston is highly delighted at having gained the loan of the Duc de Montpensier's collection of paintings by old masters. These paintings were, it is said, to have been exhibited at the Royal Academy (old masters) last winter, but in consequence of the Landseer exhibition they were not wanted, and were lying

packed in case at Gibraltar, when an American, Mr. Arthur Codman, chanced to hear of them, and conceived the idea of securing the loan of them to America. The consent of the Duke was gained on condition that the Americans should pay all expenses, and insure the collection for 500,000 dollars. The paintings are principally works of the Spanish school, and there is one important example of Murillo. They are to be exhibited in the Boston Athenæum in a newly-built gallery. America does not often get such an opportunity of studying the works of the old masters.

THE late senator, Charles Sumner, bequeathed the whole of his art collection a short time ago to Boston. Charles Sumner was one of the few American statesmen who took any interest in art.

"WHAT the Moon shines upon" is the title of a series of drawings in black and white, by Professor Hugo Knorr, that is now being exhibited by the Austrian Art Union. The drawings, it is said, are very effective, and full of poetic feeling. They will be reproduced by the Art Union.

THE *Westminster Gazette* states that the Brompton Oratorians are about to build a new church on the same site as their present plain building. It is not to be built in the prevailing Gothic style, but is to afford Londoners a splendid example of Italian Renaissance.

THE STAGE.

"L'ARTICLE 47" AT THE PRINCESS'S THEATRE.

As literary work *L'Article 47* has no extraordinary value. It contains some smart sayings, and shows some accurate and rather humorous observation of character, but the sayings are not smarter than those which any tolerably lively person utters in the moment of *bien-être* which is generally the moment of invention; and the observation of character, though accurate, is too superficial to be keen. The success of the drama is essentially a stage success: a success dependent on strength and variety of incident; and yet it is a mistake to call *L'Article 47* a sensation play, as that term is understood amongst us, for neither gorgeous scenery nor hair-breadth escapes, nor unlimited pistol-shots, contribute to its triumph. It is sought to interest us in the virtuous struggle of a man against the evil influence of his youth: against the plots and the commands of a woman whom in a moment of passion he has wounded, and who pursues him with something which it is difficult to define as either love or hate. There is not the slightest attempt to make us sympathise with the efforts of the woman. Cora is as plainly bad as is the Dalilah of M. Octave Feuillet, and her deeds are even more inconsequent. But M. Belot himself is "on the side of the angels." No one would imagine from this work that he had written the notorious novel, *Mademoiselle Giraud, ma femme*. Perhaps he desired to atone for this novel in some such way as M. Ernest Feydeau atoned for *Fanny* by the respectable pages of *Le Secret du Bonheur*—a story almost too utilitarian for Bentham, and too instructive for Exeter Hall.

But the means by which the interest is sought to be aroused—the methods of the novelist who has arranged his drama in six parts—are not such as take very firm hold either of a good London audience or of the Paris audiences of the Français, the Vaudeville, or the Gymnase. The treatment gives satisfaction to the audience of the Ambigu—indefatigable playgoers, who form *queue* at six, go in at seven, are tranquilly attentive for the next two hours, and more closely absorbed until midnight. Nothing is narrated, except indeed what is narrated amid the parade of a court of justice. Everything passes before the eyes.

The part of Cora is exactly suited to Mme. Pasca. It makes a great demand upon physical force and energy. It makes a less demand, though still a considerable one, upon the common intelligence; and it makes hardly any demand at all upon that

power of rapid and delicate and subtle sympathy with ever-changing currents of feeling which is, of course, at the root of all high success in imaginative work. Mme. Pasca has grace of movement and manner: she was never in need of that "school of good breeding" which exists at the Conservatoire. She has swift and decided action. She has the sagacity of a woman of the world, and the experience of a practised actress. She is without great pathos: her effects are broad: she is by no means a mistress of detail. Her passion can be violent, but it can rarely be warm. Her repose can be statuesque—it can rarely be tender and feminine. In *L'Article 47*, that part of her acting which compels the closest attention is the scene in which Cora, having waited powerlessly upon the determination of Georges du Hamel to escape from her toils, by telling his wife once for all what was their old relationship, is dismayed by the contempt with which he looks at her in her supreme effort—the effort, he says, of a mad woman—and then, when he has gone out, rocks herself despairingly with clasped hands and downcast head, and fancies at last that he is with her again, and keeps not even the reason that is required for revenge. Yet here, it should be noticed, the interest is more truly in the situation than in the acting. Given bodily strength and sufficient intelligence in its interpreter, and the scene will act itself, one may say. It is not made the occasion for the display of high or delicate imaginative power. What is really the best thing done by Mme. Pasca, throughout the piece, is her answer, in the second scene, to the question "Vous l'aimez?" "*Qui sait!*" answers Mme. Pasca with the tone of a fatalist—circumstances shall guide her; chance shall guide her: she cannot guide herself.

The general performance says much for the abilities of the regular company. M. Bilhaut is not without force in the part of the young husband who was once the lover of Cora. M. Didier is entirely satisfactory as a young man who returns to the bosom of his family from the saloons of Cora so soon as his pocket is as empty as his head. M. Schey is as amusing as it is possible to be in the small but very natural part of a provincial who is grievously disappointed not to be able to say all that he would like to say when he is called as a witness in a court of justice. M. Gouget is a characteristic president of the court. Mme. Dalloca is the mother of the accused, Georges du Hamel—he is wrongly accused, at the beginning, of an attempt to murder. Mlle. Andrée Kelly is fittingly simple and plaintive as Du Hamel's wife, and Mlle. Davenay plays with the utmost liveliness her part of a witness who has decided opinions, which both in and out of season she impresses upon court and auditory.

FREDERICK WEDMORE.

A PLAY by Mr. Robert Buchanan is in preparation at the Haymarket.

THE theatrical event of the week has been the production, at the Opéra Comique, of Lecocq's latest work. *Giroflé-Girofla* is performed in London even before it is performed in Paris; and it is given by its original interpreters, M. Humbert's company, from the Théâtre des Fantaisies Parisiennes, at Brussels. Success of a certain kind was already assured for it. Probably it is as good, judged from a musician's point of view, as the *Fille de Madame Angot*; but it is as yet too early to say whether it can become as popular. At the Opéra Comique the best is done for it; and a good audience—an audience such as the music of a second-rate burlesque would hardly draw—appears to be entirely satisfied.

ALMOST next door to the Opéra Comique—that is, at the Globe—they are still playing *La Fille de Madame Angot*, in English, and nowhere has it been better done. The band is good, and is well led; the chorus thoroughly trained; the dresses fine; and the scenery and appointments

satisfactory, save that in the choice of drapery for background in the second act there is a little mistake which a woman of taste would detect in a minute. Mr. Cotte is a capital representative of Ange Pitou; Miss Loseby has rarely acted with more intelligence, or sung better than as Clairette; Miss Alice Cook sings with much spirit the air in the first act, which everybody knows; and Mlle. Cornélie d'Anka is admirable as Mlle. Lange.

THE hot weather has put the genuine attractiveness of our plays to the test, and *Pride* has been suddenly withdrawn from the Vaudeville, and *Mont Blanc* as suddenly from the Haymarket. The latter theatre contents itself for the moment with the *Overland Route*—good wine, that needs no bush, though it generally gets it; and at the Vaudeville they are playing the *School for Scandal* again. The cast is not quite so complete as when the comedy was first acted at this theatre two years ago, but in the main the performance is still excellent. Messrs. James and Thorne have resumed the parts of Sir Benjamin and Crabtree, which they deserted during the latter portion of the run of the piece, and the impersonations of Sir Peter, Lady Teazle, and Sir Oliver, by Mr. Farren, Miss Amy Fawsitt, and Mr. Horace Wigan, are, we believe, entirely truthful embodiments of characters which it is quite easy to make over-subtle. Or, to speak more accurately, the conception formed by each artist is, we believe, wholly right, and the execution only here and there, at a point or two, a little below it.

MR. EMERY has been acting at the Surrey Theatre, in *Little Em'ly*. He has been playing, of course, the part of Peggotty, in which he is greatly successful.

MR. OXFORD's version of Mrs. Henry Wood's best known tale has just been produced at the St. James's Theatre.

M. DELACOUR is the author of a new one-act comedy performed at the Gymnase under the title of *Une Femme qui Ment*. The woman's lies are white lies, and there is a great mystery about a little thing. A wife's expenditure is perceptibly in excess of her recognised income. Her economies are still more remarkable. She saves a couple of thousand francs a month out of an income of three hundred. She says she gains her money by a lucky ticket in a lottery, and claims to have won a valuable time-piece which happens to have been won by her husband. The husband is anxious, but his wife has a candid face—so has the actress who impersonates her—and a satisfactory explanation is at last forthcoming. Her godfather had on her marriage-day given her a secret present, of moneys upon which she could draw at her need. So all is settled happily: nothing but truth has been violated, and it does not seem to occur either to the husband or to any friend that the early deception about so slight a matter bodes no good to his future. This light piece is tolerably acted, but the interest shown in it is never very keen.

WE believe that, contrary to expectation, Mdme. Chaumont will not come to London this season.

THE Porte Saint Martin Theatre being now abandoned to *spectacle*, the tearful drama of *Les Deux Orphelines* has been moved to the Chatelet.

THE Bouffes-Parisiens closes on Monday; and Madame Judic, its *prima donna*, will not re-appear in Paris until October.

THE company of the Odéon are playing at Rouen.

THE 268th anniversary of the birth of Corneille was celebrated at the Français by one of its endless evenings, from seven o'clock to midnight, when the *Cid* and *Le Menteur* were performed. The artists who took part were, of course, those whose speciality is what they style "le grand répertoire"—Maubant and Mounet-Sully, assisted by Delaunay, Mlle. Tholer, Mlle. Favart, and

others. There was, of course, enthusiasm among an audience with whom Corneille is a religion.

M. GOR, at the Français, has been playing his great part in *Le Duc Job*—a performance in which it would have been well could we have seen him in London.

THE last nights of *Le Sphinx* are announced. It has yielded to M. Octave Feuillet about two thousand pounds, which is more than can be said for his first comedy, *Le Bourgeois de Rome*, which was mildly hissed at the Odéon as long ago as 1846.

A RECENT number of the *Journal des Savants* has drawn attention to the now almost forgotten epics, lyrics, and dramas of its recently deceased editor, M. Pierre Lebrun, formerly Director of the then Imprimerie Royal of Paris. We think the remainder is not uncalled for, since some of Lebrun's pieces (he began to scribble tragedies at the age of twelve) are worthy of being rescued from oblivion. His *Ulysse*, *Cid d'Andalousie*, and *Marie Stuart*, in which Talma took the principal parts, have great merit, while his lyrics have a certain realistic grace, reflected from the author's strong love of nature, which entitles them to an honourable place in modern French poetry. We are glad therefore to find that a reprint is meditated of *Les Œuvres de Pierre Lebrun, 1844-1861*.

MUSIC.

NEW MUSICAL PUBLICATIONS.

A PILE of what may be called musical *ephemeræ* lies before us; and its constantly increasing bulk calls on us to deal with it before it becomes wholly unmanageable. Most of the pieces, happily, are such as to require no lengthened notice; and a few lines indicating their general characteristics will be all that is needed.

To take first the periodical publications. The numbers of the *Musical Monthly* for April and June (Enoch & Sons) are of the usual variety in their contents, which are moreover up to their average of merit. It will be satisfactory to those who take a pride in the musical reputation of our countrymen to learn that the two best pianoforte pieces in the present numbers are both from English pens. These are the "Alla Mazurka" by Lindsay Sloper, and the "Ballade" by Ignace Gibsons, both of which are excellent. Very good too, and quite out of the beaten track, is a "Marche Circassienne" by Renaud de Vilbac. On the other hand, it must honestly be said there is one piece (fortunately but one) which we positively dislike—a so-called "Rêverie Poétique" entitled "La Nuit d'Octobre," by Jules Philipot, which is vague, pretentious, and in one place absurd; this place being a cadenza marked "Un chant d'oiseau." No one of course expects the notes of a bird's song to be exactly reproduced on the piano; but this cadenza, with the exception of the shake at the close, has not even the least affinity with the conventional treatment of the subject, and has nothing instead but passages which may be met with in hundreds of other pieces. Let our objection be clearly understood. It is not to the cadenza itself; if a man chooses to insert a very commonplace "flourish" into his piece, it is his own business, and he has a perfect right to do so. The objection is to the affectation (unfortunately only too common) of giving such a ridiculous name to it as "Chant d'oiseau." Some players, however, like this sort of thing, and it is possibly hypercritical to object. In any case there is quite sufficient thoroughly good music in each number to satisfy those who may share our opinion as to "La Nuit d'Octobre."

The vocal numbers of the same periodical also contain much good music—there being five songs in the April number, and four in that for June. Among those which can be selected for special praise are "The Traveller," by E. Lassen, "Longing," by W. Taubert, "The Trysting Tree," by G. A. Macfarren, and "The Hunter," by J. B.

Rongé. Lovers of the sentimental will also be pleased with Chavagnat's "I have lost my turtle-dove," and Louisa Gray's "Since then."

The last number of the *Organist's Quarterly Journal* (Novello, Ewer & Co.) contains contributions from five different writers. The first piece is a well-written and effective "Offertoire," by C. A. Barry, which contains a passage in octaves for the pedals on the third page that will rather trouble second-rate players. Next follow "Twelve Short and Easy Preludes," by August Bord, who has set himself much the same task as an author who would undertake to write twelve short essays, each within the compass of six lines. Little can be said in so limited a space, and Herr Bord is therefore not to be blamed for saying little. The following "Allegro Marziale," by F. E. Gladstone, is bold and pleasing, and well worthy of the reputation of the musician whose name it bears. The fourth piece, an "Andante" by J. H. Wallis, is in the French style—melodious but mild; and the last piece is a Prelude and Fugue, by Walter Wilmore, which presents no features for special comment.

Part 12 of the *Practical Choir Master* (Metzler & Co.), which, like the publication last noticed, is edited by Dr. Spark of Leeds, contains, first, a "Benedictus," by Berthold Tours, written with the skill of a musician, but, to our thinking, less interesting in its ideas than some of the composer's other pieces; next an anthem, "Above all Praise," by B. H. Wortham, which parish choirs of any attainments will find both practicable and pleasing; and lastly, an anthem by C. G. P. Grädener, "The days of man are but as grass," which contains an obligato organ-part, and concludes effectively with the old German chorale, "Es ist das Heil uns kommen her."

To come now to pianoforte music. No. 2 of "Wayside Sketches," by Arthur O'Leary (Novello, Ewer & Co.), is a really excellent little piece both attractive and original in its themes, and skilfully treated. It is neither too long nor too difficult to deserve a wide popularity. The same composer's fantasia on "There's nae luck about the house" (Lamborn Cock), is also thoroughly well written. It is, however, both more brilliant and more difficult than the piece last noticed, and is indeed intended for players of a higher degree of proficiency. "Two Sketches," for the piano, by M. G. Carmichael (Augener & Co.), show very decided aptitude for composition, and a freedom of treatment in the harmonies which evinces considerable practice. They are good enough to make us think that Miss Carmichael can do even better. The proof-sheets have been most imperfectly corrected; for the pieces positively swarm with misprints, though these are mostly not such as to mislead the player, as they consist chiefly of the omission of signs of transposition. "Cease your Funning," by Westley Richards (Lamborn Cock), is a well-written set of variations on the old air, in which Mr. Richards has adhered rather to the older model of variations, as found in Mozart, than to those of the more modern school, of which Schumann and Thalberg may, in totally different styles, be taken as examples. The same composer's "Capriccio" for the piano (same publisher) suffers from the not too common fault of a superabundance of ideas. Here are themes enough to make two or three capriccios; and the consequence is that, though containing many good points, the piece as a whole is discursive and wanting in unity. Fewer ideas and more development would have benefited it greatly. "Gavotte Moderne" en Ut, par Berthold Tours (Weekes and Co.), is a very successful attempt to combine the old dance form with nineteenth century harmony and treatment. The little piece, though unpretending, is thoroughly good. "The Russian National Hymn," by Boyton Smith (same publishers), is a *pièce d'occasion*, called forth, doubtless, by the recent visit of the Czar to this country. It is quite conventional both in form and treatment. Two pieces by Arthur Fox, entitled respectively,

"Meditation" and "Heartsease," are neither particularly bad nor remarkably good.

Of vocal music, we can mention with commendation, as a really pleasing little song, "The Shadow on my Heart," by Arthur O'Leary (Novello, Ewer & Co.). "The Twilight is sinking," by Wilfred E. Bendall (Weekes & Co.), is a simple but elegant little ballad skilfully harmonised. "Dreams of Home," by Alexander Reichardt (same publishers), is a song composed in memory of Dr. Livingstone, which, though its quality cannot be described as inferior, will probably owe whatever popularity it is destined to attain rather to the subject than to the music. "Deceived," song, by Marie de Brockton (The Charing Cross Publishing Company), is one of those numerous pieces which have no business to be published at all. A composer has no more right to print a piece of music when he has not studied harmony, than an author would have to publish a book if he could not write correct English. No natural feeling for music is a compensation for this shortcoming, which is more injurious than the parallel case supposed, inasmuch as while any educated reader would at once notice inaccuracies in writing, the large majority of amateurs would not be aware of mistakes in harmony, and thus their tastes would, unknown to themselves, become vitiated. In all probability, however, the composer herself is in the present case not aware that there is anything amiss with her accompaniments! "The Word and the Look," by G. A. B. Beecroft (Weekes & Co.), is a pretty, though slightly commonplace ballad. Three songs by C. Villiers Stanford (Chappell & Co.), from George Eliot's *Spanish Gipsy*, bearing the titles, "The World is great," "Bright, O bright Fledalma," and "The Radiant Dark," are, it is to be feared, almost too good to be very popular. They display real musical feeling, and not a little originality; but they appeal rather to cultivated musicians than to the general public. Lastly, there remains to notice a part-song, "Wake, dearest love," by Westley Richards (Lamborn Cock), of which it will be sufficient to say that it is both melodious, and well-written for the voices.

EBENEZER PROUT.

THE fourth of the Crystal Palace Summer Concerts, which took place last Saturday, was devoted to English composers, and was remarkable alike for its judiciously representative character and its preposterous length. We have before had occasion to remark on the excessive length of these otherwise admirable concerts; but the present was the most unreasonable that we ever remember, containing no less than twenty-one numbers. Every school of English music was represented with more or less fulness. As illustrations of the part-song and madrigal, were given Edwardes's "In going to my lonely bed," Morley's "Now is the month of maying," Gibbons's "The Silver Swan," and Pearsall's "Oh, who will o'er the downs so free;" while Croft's chorus, "Cry aloud and shout," furnished a specimen of the English cathedral music; and as glee writers, Bishop ("Sleep, gentle lady" and "Foresters, sound the cheerful horn"), Goss ("O thou whose beams"), and Webbe ("Discord, dire Sister") were brought forward. Songs were given by Purcell, Arne, Boyce, Balfe, Wallace, Hatton, and Bennett. Mr. J. F. Barnett gave a very good performance of the last two movements of Bennett's Fourth Concerto; Dr. Stainer contributed two solos on the organ; and the orchestral pieces given were Mr. Macfarren's overture to *Chery Chase*, the scherzo from Mr. J. F. Barnett's (MS.) Symphony in A, and a selection from Mr. Arthur Sullivan's graceful and pleasing music to the *Merchant of Venice*. The principal vocalists were Mme. Lemmens-Sherington, Mme. Patey, Mr. E. Lloyd, and Signor Foli; the glees were sung by the London Vocal Union, under the direction of Mr. F. Walker, and the choruses by the Crystal Palace choir. In the absence of Mr. Manns, Mr. Arthur Sullivan

officiated as conductor. With the exception of the undue length already referred to, the concert was an admirable one.

THE Cambridge University Musical Society gave two most excellent concerts in the Guildhall, Cambridge, on the 2nd and 3rd of June. The first was a chamber-concert, at which, among other things, Raff's sonata in C minor for piano and violin was performed for the first time in England. The second was a full choral and orchestral concert, the chorus consisting of the members of the society, while the orchestra was chiefly composed of amateurs, a few well-known London professionals (among them Herr Straus as leader), being engaged for the most important parts. The first part of the concert was miscellaneous, the most important items being the overture to *Egmont*, and a pianoforte concerto, by Mr. C. V. Stanford, the conductor of the society—a very interesting and clever work, the solo part of which was played in a most admirable manner by Mr. McClintock—one of the best amateur pianists we have ever listened to. The second part of the concert consisted of Schumann's *Paradise and the Peri*—a most formidable task for an amateur society. The performance, however, making allowance for a little coarseness, the inevitable result of not being able to have more than one rehearsal with the band, was in the highest degree creditable to all concerned in it. The solo parts were sung by the Misses Ferrari, Miss Jessie Jones, and three amateur members of the society—Messrs. Murray, Borissow, and Jekyll, all of whom acquitted themselves excellently. Both band and chorus were very good, and great praise is due to Mr. Stanford for the complete success of the performance.

THE *Daily News* of Monday last contains a very interesting letter from a special correspondent giving an account of the present state of Wagner's new theatre at Bayreuth, and of the preparations being made for the performances of the *Ring des Nibelungen*, which are now definitively (?) fixed to take place in the summer of 1876.

IN Vienna the long-lost manuscript score of Schubert's music to the melodrama *Die Zauberharfe* has lately been discovered. The work is said to be unsuitable for performance; but the overture (erroneously published as the overture to *Rosamunde*) is one of the best-known and deservedly most popular of Schubert's orchestral works.

MAURICE STRAKOSCH, the well-known impresario of the Italian operas in Paris and New York, intends to start a similar enterprise in Berlin, and negotiations are in progress to secure one of the theatres of that city for a winter season of three or four months. Besides the older Italian operas, such as *Il Barbiere*, *Semiramide*, *Mosé in Egitto*, and *Tell*, it is intended also to produce the operas of Mozart.

FROM Shanghai we learn that Mme. Arabella Goddard's concerts have drawn good houses, and that "her masterly interpretation of Beethoven and Thalberg was a valuable lesson to those who were fortunate enough to have attended." By latest advices we hear that Mme. Goddard had arrived at Singapore from China, and proposed to give one or two performances there.

A DISCOVERY has been made within the present month, at Vienna, of the original score of the *Zauberharfe* of Franz Schubert, which, after having been brought out at the Vienna Theatre many years ago, was taken off the boards and lost sight of till its recent accidental discovery in a perfect form by Dr. Kafka, the well-known teacher of music. The MS. has been submitted for the inspection of Messrs. Herbeck and Dumba, who are agreed in their opinion of its authenticity, and also as to that of several overtures and the entire score of his *Häuslicher Krieg*, which were recovered at the same time.

POSTSCRIPT.

THE Further Report on the *Utrecht Psalter*, by Sir T. Duffus Hardy, in answer to the eight Reports made to the Trustees of the British Museum, by Mr. E. A. Bond, the Rev. H. O. Coxe, Sir Digby Wyatt, Mr. Westwood, Canon Swainson, and others, was issued this week. We hope shortly to give a notice of this very exhaustive reply to the objections raised against Sir T. Hardy's First Report.

A FEW months prior to his death last summer, Thornton Hunt placed in the hands of Mr. Townshend Mayer, of Richmond, all the papers of Leigh Hunt for examination and such public use as Mr. Mayer might deem expedient. The papers comprise, of unpublished matter, MS. plays more or less complete, note books, and a large amount of correspondence ranging over fifty years with the most celebrated of Leigh Hunt's contemporaries. Mr. Townshend Mayer has decided to use some of the latter as materials for a series of articles, the first of which will appear in the *St. James's Magazine* and *United Empire Review* for July, and will be entitled "Leigh Hunt and B. R. Haydon;" some interesting and characteristic letters from the latter will be given entire. The series will not be confined to the pages of the *St. James's Magazine*.

WE are glad to learn that Sir Frederick Graham, of Netherby, has consented to allow the Historical MSS. Commissioners to examine his collection of papers, which include, among other valuable documents, a mass of official and private correspondence of Lord Preston, chiefly with James II.

MR. ALLAN J. CROSBY has just completed a new volume of his *Calendar of Foreign Papers of the Reign of Elizabeth*, in the Rolls Series. The period comprises the years 1569, 1570, and 1571; and important documents relating to Scottish affairs about the time of the death of the Regent Murray, the religious wars in France, the negotiations for a marriage between Elizabeth and the Duke of Anjou, &c., will for the first time be brought to light.

A SERIES of popular and educational lectures on the History and Philology of Assyria and Egypt, on the plan followed by the continental professors, will probably soon be originated under the sanction of the council of the Biblical Archaeology Society. Further particulars will be hereafter announced.

SATURDAY, JUNE 20, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The English in Ireland in the Eighteenth Century. By J. H. Froude, M.A. In Three Volumes. (London: Longmans & Co., 1872-1874.)

THE first volume of *The English in Ireland*, which was published in 1872, brought us down to the accession of George III.—a few years beyond the date at which the Parliamentary history of Ireland may be said to begin. Most of our readers will remember the startling picture of Irish society which that volume presented to us, and at a time, too, when it has been usual to believe that Ireland was exceptionally tranquil. Of the substantial truth of Mr. Froude's representation there can be little doubt, as it is founded on depositions which are preserved in Dublin Castle, and which, according to our author, record even worse brutalities than he has ventured to repeat. At the same time it is quite possible that Mr. Froude may have fixed his gaze too exclusively on the dark side of things, and that the lights and shadows of Irish life in the last century deserve to have been mingled in rather less unequal proportions than he has allotted to them. He himself admits that there was a class, and, to judge from his language, a considerable class, of noblemen and gentlemen who were neither absentees nor place-hunters, and who lived on their estates in dignified retirement, untainted by the national vices of drinking, duelling, and gambling. There must therefore have been numerous districts of Ireland in which the farmers and peasantry were prosperous and contented, the landlords conscientious and respected, and where the crimes which flourished elsewhere in such rank luxuriance had no existence. On this supposition we think it may fairly be objected to Mr. Froude that he leaves upon the reader's mind an impression not consistent with the facts; an impression, namely, that the social condition of Ireland a hundred years ago was exclusively made up of misery, vice, crime, corruption, and neglect. He mentions the existence of more healthy elements. But he mentions them and passes on. He never dwells at all on the brighter side of the picture. Still, no doubt, when every allowance is made for want of due proportion, enough remains to establish over and over again the truth of his central proposition, namely, that in Ireland the law was all but impotent, and that England having failed in more than one attempt to govern Ireland according to her own ideas, was content to tie the hands of the Papists, and leave the country to itself. To do this, as Mr. Froude well says, is permitted to no nation or government under the sun. And from this original contempt of obligations which no State can repudiate with safety, have flowed all the subsequent difficulties

and dangers of which Ireland has been the cradle. No serious misconceptions therefore can result from the disproportionate prominence which Mr. Froude appears to have assigned to the blacker features of his story. And there is only one other point to which we think it necessary to call attention. It seems to us that Mr. Froude might have been with advantage a little more attentive to the chronological order of events. We often find mention of events in their later stages, or their more remote operation, of which we search in vain for the beginning. We find it asserted, for instance, on such and such a page, that the English Government had levied certain duties on Irish manufactures: but there is no reference to the date when this was done, nor any clue to it in the index. Or again, Mr. Froude is of course under the frequent necessity of mentioning an Act of Parliament, known as the "6th of George the First," asserting the right of the King, Lords and Commons of Great Britain to make laws binding upon Ireland. But we cannot find in Mr. Froude's volumes any account of the passing of this Act. And on the whole we must ask Mr. Froude to excuse us for saying that the arrangement of his work—the sequence of events, that is, and the disposition of material—seems susceptible of considerable improvement.

It is somewhat difficult to extract anything like an orderly narrative out of that tangled web of Irish history which stretches from the Great Rebellion to the final establishment of the Revolution. But there appear to have been within that period three distinct schemes for a "settlement" of that unfortunate country, designed respectively by Wentworth, by Cromwell, and by James the Second. The two first attempts were alike based on the principle of stamping out Popery, though they differed from each other in the instrument employed for that purpose—Wentworth relying on Anglicanism, and Cromwell on Puritanism. James the Second, of course, aimed at nothing less than re-establishing a Roman Catholic kingdom of Ireland, supported exclusively by the Roman Catholic population, and on this attempt it is needless to dwell at any length. Mr. Froude regrets very deeply that the Cromwellian settlement was not allowed time to work itself out, being convinced that the Celtic stomach, which rejected Anglicanism, would by degrees have assimilated a more enthusiastic form of Protestantism, and that in another generation Ireland would have been as Protestant as Scotland, and as loyal to the Crown as England. Seeing, however, that, as a matter of fact, Presbyterianism did fail as much as Anglicanism in performing the task allotted to it, we may fairly require that the excuses which are made for the one shall also be extended to the other. Had Cromwell lived the Puritan scheme would have succeeded, is Mr. Froude's position. But it is equally open to a Churchman to contend that had Strafford lived, the Anglican scheme would have succeeded. That it failed after the Revolution is nothing to the purpose. In the first place, neither the one plan nor the other could have succeeded without the master mind which designed it to watch over its

progress to maturity. And in the second place, the Church had no fairer play in Ireland in the eighteenth century than the Presbyterian had. She was treated on a large scale as the Welsh Church was treated on a small scale, she was studiously clothed with the livery of conquest, and divested as far as was possible of every element of nationality. But Wales herself is a proof that there is nothing in the Anglican ritual inherently repulsive to the Celt. Before the Revolution there were no stouter Churchmen between the two channels than the Welsh people. And such being the case, we see no reasons why, under similar conditions, the Irish should not have been so too. If the Reformation had been carried out in Ireland as it was in England, the Irish would have glided imperceptibly into the new order of things as the Welsh did. And even as it was, we cannot think the Church of Ireland failed as a missionary church for the reasons assigned by Mr. Froude:—

"Before a man can persuade others to accept him as a guide, he must know his own mind, and be ready with a Yes or No, on the questions with which his hearers are perplexed. On the points which divide Protestant from Romanist, the Anglican answers Yes and No. Is there a Christian priesthood? There is, and there is not. Is there a Real Presence in the Eucharist? There is, and there is not. Is baptism necessary to salvation? It is, and it is not. Such hesitating modes of thought may be prudent and cautious, but they will make no converts."

It seems to us that the objection which occurs so forcibly to Mr. Froude is one that can only occur at all to educated minds. Educated minds may at the same time be more disposed to waive such an objection. But to persons unaccustomed to exercise their reasoning powers, it is not very likely to present itself. They do not put principles or systems, but only individuals, to the question; and whatever answers may be extorted from Anglicanism under the screw of a relentless logic, the answer here supposed is not to be extorted from Anglicans. We, indeed, deny the correctness of Mr. Froude's definition of Anglicanism. But even granting its truth, we dispute the conclusion he derives from it.

At the accession of George the Third, the Irish Parliament had just begun to wake up. In 1753 Ireland was sufficiently prosperous to have a surplus of revenue over expenditure, and on the disposal of this surplus debates took place which laid the foundation of a regular Parliamentary opposition. At this time there were four great families in Ireland who, if it suited them to agree, could dictate their own terms to the Castle. The Fitzgeralds, the Boyles, the Ponsonbys, and the Beresfords virtually returned the House of Commons; and a great part of Mr. Froude's history is simply the history of their intrigues. Successive Viceroy's struggled to resist their influence. But they could only defeat them by the employment of mercenaries against them. And between purchasing a patriot and purchasing a peer the difference was hardly worth considering. As Mr. Froude observes, the only chance of escape lay in dispensing with the House of Commons altogether, by making the hereditary revenue of the Crown suffice

for the expenses of government. Could this have been accomplished, and the necessity of obtaining supplies from Parliament have been got rid of, many useful reforms could have been effected in the condition of Ireland, which might materially have changed her history. But the obstacle to this consummation lay in the inveterate jobbery which had become an integral part of the English system of government. It had long been the convenient practice of the English Ministers to quarter political adherents or royal favourites on the Irish establishment. And they would not relinquish this resource even for the regeneration of the country. Lord Townshend, the most able and conscientious viceroy whom Ireland had yet known, found all his best intentions wrecked upon this sunken rock. And an admirable paper of instructions, drawn up for him by George III., in 1765, of which Mr. Froude speaks in terms of the warmest eulogy, for the same reason became a dead letter. The young King was really anxious to do his duty. He saw what Ireland wanted, and he went straight to the point. But "the system" was too much for him, and the oligarchy remained masters of the field. While such was the Parliamentary situation of affairs at the period in question, religious parties were divided into four sections. Both Roman Catholics and Protestants were subdivided into two species, though not separated from each other by exactly analogous differentials. The Roman Catholic sections were divided from each other by political, the Protestant by clerical, distinctions. The old dispossessed families of Irish Catholics, who had sunk into the ranks of the peasantry, but who still preserved plans of their estates, and went through the form of settling and resettling them on all proper occasions, were the "irreconcilables" of the Popish party, and no relaxation of the penal laws or of civil disabilities would have seemed of any value to them unaccompanied by the restitution of their property. This party looked to France or Spain as their deliverer, and would be satisfied with nothing short of complete separation from England. The Anglo-Irish Roman Catholics, on the other hand, who had been left in possession of their lands, were as a rule loyal to Great Britain, and anxious only for the repeal of laws which were the source of great social inconvenience to them. The Protestant party, in turn, was divided into churchmen and dissenters, and between these the difference was purely ecclesiastical. The difference between the Roman Catholics was not one which prevented them from joining together up to a certain point in pursuit of a common object. But the difference between the Anglicans and the Presbyterians did prevent them from doing so. The latter were still under all their old disabilities. The Test Act was in full force; and they were made every day to feel their inferiority, in spite of the great services which they had rendered to the Imperial Government. Between the two "centres"—the Anglican aristocracy that is, and the Roman Catholic—there was always a tendency to accommodation; but it never came to more than that. Old jealousies could not so easily be allayed; and neither the Irish Bishops

nor the Romish priests were backward in fomenting them. But the conciliatory attitude and loyal professions of the one class of Roman Catholics, in which there is every reason to suppose they were perfectly sincere, seem to have blinded the English Government to the implacable hostility of the other; and to have been one great cause which led to the early successes of the rebels in 1798. While, however, the disabilities under which both Popish and Protestant dissenters alike laboured were to some extent forgotten in the hatred which they bore each other, there were other grievances which all Irishmen alike could feel. Poyning's Act by which all Irish measures must be submitted to the English Government before they could be passed at home, and the Act of George the First asserting the right of the English Government to pass laws which should be binding upon Ireland, rankled in the minds of Irish patriots and politicians. But the impolitic restrictions laid by Great Britain on the trade and commerce of Ireland were felt by every class in the kingdom, and more particularly by the "Irish Colony," as Mr. Froude calls the English in Ireland, whom Great Britain was bound by every means in her power to encourage and protect. In 1663, Ireland was excluded from the benefit of the Navigation Act, and compelled to import all her goods in English ships. In 1698 her woollen manufacture was ruined by the imposition of prohibitive export duties. And some time in the eighteenth century her linen trade, which had been left free when her wool growers had been excluded from the market, was laid under similar restrictions. These various impositions had not been without their effect on the inhabitants of the island. The Presbyterians of the north, the most thriving and industrious part of the Irish population, had emigrated to America in considerable numbers when the wool trade was destroyed. Twenty years afterwards, when all hope of their sectarian position being improved was finally at an end, a still larger exodus began. And lastly, in 1772, the discontent which had been caused by religious and commercial grievances was resuscitated in a heightened form, and under more exasperating circumstances, by a wound inflicted upon agriculture. Notwithstanding the injurious effects of recent legislation, such was the fertility of the soil and the industry of the inhabitants, that the flax trade still prospered. The farmers grew rich. The land was everywhere well cultivated: and the whole face of the country in these more fortunate provinces wore the aspect of happiness and plenty. Hearing of these things, one of the wealthiest of the Irish absentees, the Marquis of Donegal, determined as his leases fell in to exact enormous fines for the renewal of them. The tenants were unable to pay them. The capitalists of Belfast and Lisburn stepped in over their heads; and, the example of the Marquis being generally followed, hundreds of families suddenly found themselves ejected from the land which they had held for generations, and which to some extent had been rendered productive by their own labour. Then began a third and a more fatal emigration of the flower of the Ulster yeomanry. Already exasperated by years

of religious humiliation, this last act of oppression drove over the Atlantic shipload after shipload of that stubborn and vindictive race, till it is calculated that more than thirty thousand of them had rejoined their kinsmen in the colonies, there to be foremost in the work of exciting rebellion against England, and to avenge on the Potomac and Ohio the wrongs of Antrim and Roscommon. There were many, however, who were too poor to cross the ocean, and these took their own revenge in their own way on the obnoxious strangers. They hamstrung their cattle, burned their farmsteads, and tore up their leases and agreements. The riots were put down by military force, but the mischief was done. The King, the Cabinet, and the English House of Commons understood and deplored the infatuation of the Irish landlords, who were cutting the ground from under their own feet, as well as sending so formidable a reinforcement to the mutinous spirits in America. But the Irish House of Commons only resolved that the fines asked were not excessive, and that the resistance provoked by them was an invasion of the rights of property. Lord Chesterfield, in writing to his friend the Bishop of Waterford some few years before, had declared that if the soldiers had killed only half as many landlords as they had Whiteboys, it would have been much better for the country. Chesterfield is a witness above suspicion; and when we find him on the same side as Mr. Froude, the conviction is forced upon one's mind that, though there might be many Irish landlords of a different character, the bad ones formed the majority, and were not less black than he has painted them. Whiteboys and Oakboys, Hearts of Steel and Peep-o'-Day Boys—the various lawless associations which succeeded one another in quick succession, and familiarised the Irish with conspiracy, *hinc causas habuere*. The condition of Ireland during the eighteenth century was one long course of preparation for the rebellion of '98. And the discipline of the insurgents who followed Father John and Father Kern, and the secrecy and celerity of their movements, were the natural product of that system of organised outrage which broke out in one part of Ireland as fast as it subsided in another.

Such in brief was the condition of the Island of Saints during the lifetime of the generation which preceded the American war; and it was the American war which finally brought matters to a crisis. At war not only with our revolted colonies, but with France, Spain, and Holland into the bargain, England had neither soldiers nor ships to spare for the protection of Ireland. The Channel swarmed with privateers, who not only captured our merchantmen, but landed on the coast, which they ravaged and pillaged with impunity. Irishmen declared that if England was unable to defend them, they must be permitted to defend themselves. Hence the formation of the Irish volunteers, who in the absence of any regular force were for the time masters of Ireland. It appears at this time to have been possible that a combined insurrection of Catholics and Protestants should break

out, with which England would be powerless to cope. She had alienated both Papists and Presbyterians by religious disabilities, and both Protestants and Papists by commercial and constitutional restrictions. Her "army of occupation" was just as disaffected as those it was meant to hold in check. And if Ireland was not to be conciliated, she must either be reconquered or abandoned. Of the two last alternatives there was of course no serious thought. And the Government gave way at all points—the penal laws against the Catholics were relaxed; one by one the commercial restrictions were abolished; Poyning's Act and the sixth of George I. were repealed; and it appeared for a brief period as if a reconciliation of the two countries had finally taken place, as if the suspicions and jealousies of the patriotic party had been removed for ever, and Popish hostility reduced to eternal insignificance.

"Now at last all obstacles to the Irish millennium were gone, every measure had been granted which the people had demanded as necessary for their happiness. The new era might now begin as soon as it liked."

Mr. Froude is not so bitter even on English misgovernment as he is upon the childish credulity of English statesmen, who have allowed themselves so often to be the dupes of phantoms such as these. Then, as more recently, discord would be bound in chains, and cast howling into outer darkness. Then, as more recently, the recognition of Irish ideas was to work a miracle on Ireland, "to pluck from her memory a rooted sorrow;" and then, as more recently, these short-lived hopes were doomed to absolute disappointment. Every concession by England was only used by Ireland as a stepping-stone to fresh demands, and the removal of one grievance was only regarded as an additional reason for the discovery of a new one.

"Uno avulso non deficit alter
Aureus, et simili frondescit virga metallo."

There is reason to doubt, however, whether all the English statesmen of that day were equally deceived. The Duke of Portland, in his correspondence with Lord Shelburne, hints at an alternative scheme in place of the proposed concessions, and that was nothing less than to cut Ireland adrift, and to let her settle these questions for herself. Mr. Froude thinks it a great pity that this experiment was not tried:—

"No foreign power could have penetrated the floating patrol with which England could have surrounded her shores, and shut her up within her own limits. Protestant and Catholic, Dissenter and Churchman, Anglo-Irishman and Celt, would have enjoyed to the full the freedom for which they were so clamorous. A few years of liberty on those terms would probably have satisfied Grattan. The mutinous colony would have discovered the meaning of the 'nationality' which they were so anxious to revive; and such of the population of both races as survived when another MacMorrough re-invited England's interference, would have been contented to remain for the future members of the British Empire on less uneasy terms."

He even thinks that if the crisis had occurred after, instead of before, the great victories of Elliott and Rodney, it possibly *might* have been tried. And it would, we agree with him, have been the solution of a great many

problems. However, the opportunity was not offered; and the sixteen years which followed between the establishment of the constitution of 1782 and the rebellion of 1798 do but add another chapter to that curious history of legislative failures which the Liberal statesmen of England appear to have read backwards. Not satisfied with the freedom now assured to their trade, the Irish sugar refiners, and Irish silk and woollen manufacturers, began to clamour for protection; for a prohibitive tariff, that is, against *English* goods. Not satisfied with the repeal of Poyning's Act, and the Act of George I., which they had protested was all that they required, the Irish patriots now required complete constitutional autonomy; to have no other connexion, that is, with Great Britain, than Great Britain had at that time with Hanover. They now insisted on protection and nationality with the same frantic vehemence as they had formerly displayed in the pursuit of free trade and legislative independence. One step was leading to another. And it soon in fact became evident that there was no alternative between going to these extreme lengths and a union of the two legislatures. The demands of Ireland were irreconcilable with the existing constitution: and unless we were prepared to let her swing free of England altogether, retaining only her allegiance to the English Crown, the connexion must be drawn still closer, and she must be incorporated with this country like Scotland. The more far-sighted of the statesmen of the day had become convinced of this necessity before the outbreak of the rebellion. But the rebellion supplied them with the opportunity which they wanted, and one obstacle to the good government of Ireland was removed in the shape of a legislative assembly, the sole object of whose members, or at least of two-thirds of them, may be summed up in the single word—plunder. But, as Mr. Froude very properly insists, the evil, though in a milder form, and on another scene, still flourishes, and must continue to flourish, as long as the "Irish vote" is made the object of party tactics; and as long as we refuse to recognise that under every demand for legal, social, or ecclesiastical reform which is made by the representatives of Celtic Ireland, lies the one hidden purpose which has animated four-fifths of the nation since the days of Cromwell; namely, entire separation from England, and the restitution of the soil to the children of the old proprietors. Everything else is but a pretext. That this state of feeling may be due to English misgovernment does not affect the practical bearings of the subject. What bad government has done, good government cannot necessarily undo. Allopathy cannot always cure what it would certainly have prevented. Some poisons once admitted into the human constitution, though healthy habits, a careful diet, and skilful pharmacy may hold them in suspense, are, in fact, ineradicable, and sure to reassert themselves at intervals, though it may be under different forms. The poison in the Celtic blood is hatred of the English supremacy; and to legislate for Ireland in the expectation that any particular measure can succeed in eradicating that, is the merest quackery. The disease may wear

itself out under healthier conditions of national life. But that will take at least another century. And in the mean time it is madness to give way to propositions of what we disapprove on principle, in hopes of propitiating a people in whose eyes all our gifts are Grecian ones. So said her orators in 1782; and so think her people still.

Such we take to be the moral of this very interesting work. Space has compelled us to pass over many of its details: the Whiteboys flitting over the mountains on their barbarous errands, their white shirts gleaming in the moonlight, and the terrified shepherds and herdsmen crouching in their lonely huts as they listened to the shots and the shouts, and the roaring of the wounded cattle; the tithe proctor writhing on the ground as the largest tom cat that could be caught was drawn along his bare back; the volunteers in their green and gold uniforms, and gorgeous equipments, which put the finishing stroke to many an Irish gentleman's estate, and the park at Dunleckny, where they were all so hospitably entertained that the ground next morning was strewn with their bodies like a battle-field; the needy placemen and adventurers, the aristocratic jobbers and plunderers, whose political profligacy was paraded with cynical ostentation; the political leaders, who were always eloquent and brilliant, and sometimes unselfish and sincere—Flood, Grattan, Burgh, and the bold and uncompromising Fitzgibbon; the horrible crimes and heroic courage which at once disfigured and adorned the insurrection; all these scenes and figures are brought before us by Mr. Froude with the skill of a great literary artist, and will be eagerly devoured by thousands for whom the more serious portions of his work will have, perhaps, little interest. We cannot help regretting that the entire work was not published some eight or ten years earlier, when it was not too late for its lessons to have had some effect. But its purely literary value is, of course, the same at all times; and, in point of style and composition, Mr. Froude has in these volumes surpassed himself.

T. E. KEBBEL.

The Complete Poems of Sir Philip Sidney.
Edited by the Rev. A. Grosart. In Two Volumes. (Printed for Private Circulation, 1873, in "The Fuller Worthies' Library.")

THIS claims to be, and is, the most complete edition of Sir Philip Sidney's collected poems. Mr. Grosart has printed, in two magnificent volumes, the songs and sonnets known under the title of *Astrophel and Stella*, the lyrics extracted from the Countess of Pembroke's *Arcadia*, the metrical version of the first forty-three Psalms which Sidney left unfinished at his death, and two miscellaneous collections of sonnets and songs, entitled here, for the first time, *Sidera* and *Pansies* from Penshurst and Wilton. The book is enriched with engravings of Penshurst and Wilton seen from different points of view, and with a medallion of the Warwick Castle portrait of Sir Philip Sidney. Mr. Grosart has conscientiously fulfilled his duty as editor by a sufficient account of the materials in MS. or print to which he has

had access, as well as by the addition of copious notes and illustrations to the poems. It may perhaps be regretted that his critical discussion of Sidney's place in English poetry is not more full, and that he has not supported his own very definite theory concerning the relation of Sir Philip Sidney to Lady Rich (see vol. i. pp. xxxv.-xlili.), by a more thorough attempt to restore the proper order of the *Astrophel and Stella* lyrics. It is true that Mr. Grosart points out that these love-verses were only handed about in MS. among Sidney's private friends during his lifetime, and that after his death they were confusedly printed in what he well characterises as a "semi-furtive" manner. He also proceeds to suggest by what alterations in the succession of these disconnected pieces the romance of Sidney's life might be made intelligible, and the slur which has been cast upon his honour (by Godwin of all people, among others) be removed. Yet he concludes his critical inquiry with the observation: "These remarks may go to show the need of a very thorough revision of the chronology of *Astrophel and Stella*, and related poems." May we hope that at some future time Mr. Grosart will work out the interesting suggestions of his essay, and attempt a complete elucidation of this episode in Sidney's life? He is a firm believer in the reality of the poet's passion for Stella, and will by no means countenance that easy method of interpretation which finds more play of fancy than fervour of affection in a series of fugitive poems dedicated to a single name.

Sidney's reputation as a poet has more to lose than to gain by the collection of all his verses into one book. He was not in any very exalted sense of the word a poet; though the extent of his culture, the delicacy of his mind, and his lively admiration for all that is noble in nature and art, exactly fitted him to be the patron of poets, a fluent versifier, and an experimentalist in metre at a moment when our literature was just beginning to become self-conscious. There was, moreover, something high-strung in his spirit and impassioned in his genius, which gives a tone of elevation to his verse. It is not difficult to explain the ascendancy which he, the "warbler of poetic prose," the poet-critic, whose masterpiece is the *Defence of Poesy*—the high-born poet of culture, who mediated between our rude English and the refined literatures of Rome and Italy—acquired over men of far superior genius, Spenser and Jonson. There was something so thoroughly gentle and accomplished in his talent, so brilliant and winning in his personality, so splendid in the promise of his life, and so pathetic in his early death, that, when we read the epitaph of Dr. Thomas Thornton, "the tutor of Sir Philip Sidney;" of Lord Brooke, "servant to Queen Elizabeth, counsellor to King James, and friend to Sir Philip Sidney;" of Lady Pembroke, "Sidney's sister, Pembroke's mother;" and when we remember that the whole of England put on mourning for his death, we can account for this enthusiasm. But it must not blind us into believing that Sidney was a great poet. One perfect sonnet he has written, "With how sad face, O Moon, thou climbst the skies;"

many others of great excellence bear his name; and there are delicate little bits of lyric sweetness, fresh and fragrant, scattered up and down the pages of Mr. Grosart's goodly volumes. Yet the impression left upon the mind after a continuous perusal of these collected poems is that Sidney was a man of exquisite sensibility, fertile fancy, cultivated taste, and poetic sympathy—not that he was a poet in the sense in which we give that name to Petrarch, his master. His life was his noblest poem, and in literature his best work was the *Defence of Poesy*.

One great interest which attaches to the poetry of Sidney is due to its close connexion with that of Italy. Born in 1554, Sidney was nearly forty years junior to Surrey, ten years older than either Shakespeare or Marlowe, and almost exactly of the same age as Spenser. He lived, in fact, at the moment when the impulse of the Italian Renaissance had been already communicated to England, and his activity as an artist was chiefly directed toward the acclimatization in our language of Italian metres and Italian modes of expression. It was an age of experiments, when English writers, eager to emulate the beauties of the classical and Southern literatures, had yet to learn the limits of our own. No poet set himself more enthusiastically to the task of discovery by imitation than did Sidney. He attempted hexameters, elegiacs (vol. ii. p. 14), Sapphics (ditto, p. 15), Phalæciacs (ditto, p. 107), Asclepiads (ditto, p. 108), and Anacreontics (ditto, p. 104), without, it must be confessed, such success as would encourage a follower to pursue the same paths. So far, he was endeavouring, in common with Italian predecessors and English contemporaries, to adapt the metrical systems of the ancients to modern versification. More was reasonably to be expected from the attention which he paid to Italian metres. Surrey and Wyatt had already cultivated the sonnet with success, and the most beautiful of Sidney's poems take this form. It is, however, to be noticed that, devoted as he was to Petrarch, he very rarely conformed his sonnet truly to the Tuscan model. A prudent avoidance of epigram in this species of composition prevented the best Italian poets from concluding the sonnet with a couplet; yet it is the very frequent custom of Sidney to do so. Out of the 110 sonnets in *Astrophel and Stella*, only twenty-two are found without the concluding couplet; and of these a large proportion, contrary to the precedent of the best Italian models, arrange the last six lines thus:—

"For though I oft myself of them bemoan,
That through my heart their beamy darts be gone,
Whose careless wounds even now most freshly bleed,
Yet since my death-wound is already got,
Dear killer, spare not thy sweet cruel shot;
A kind of grace it is to slay with speed."

These details may not be thought very important, yet they have their value when we remember what pains were being taken to assimilate English to Italian literature, and also the extreme delicacy of the structure of the sonnet as finally elaborated by Petrarch. Besides the sonnet, Sidney adopted the octave stanza of Boccaccio. Both single and double sestines he imitated

from Petrarch; but this style of composition, wearisome in Italian, becomes unutterably tedious in English. It belongs, in fact, to the toys of literature. The same cannot be said about *terza rima*, on which Sidney bestowed especial pains (see, for examples, vol. ii. pp. 71-84). In this intricate metre not only did he write long amœbean eclogues, assigning to each shepherd a *terzet*, but he even attempted to imitate the *sdrucchiolo* rhymes which a few Italian poets had used as an exhibition of their skill. The difficulty of getting triple rhymes in English hampered Sidney, and made his metre lame and awkward in the extreme. Here is a specimen of this curious experiment:—

"If sunny beams shame heavenly habitation,
If three-leaved grass seem to the sheep unsavoury,
Then base and sour is Love's most high vocation,
Or if sheep's cries can help the sun's own bravery,
Then may I hope my pipe may have ability
To help her praise who decks me in her slavery.
No, no; no words ennoble self-nobility:
As for your doubts her voice was it deceived me,
Her eye the force beyond all possibility."

Sidney's *terza rima* with single rhymes moves less deplorably than this. Another of his direct imitations from the Italian is that form of the canzone in which the rhyme at the ending of the first line is repeated in the middle of the next, and so on, as for instance (vol. ii. p. 92):—

"Up, up, Philisides, let sorrows go;
Who yields to woe doth but increase his smart.
Do not thy heart to painful custom bring,
But let us sing,—sweet tunes do passions ease;
An old man hear, who would thy fancies raise."

I might go on to illustrate Sidney's adaptation of the madrigal, the echo song, and the versified *novella* from Italian sources. But enough has been said to show that the poems from the *Arcadia* are chiefly interesting as metrical experiments. To expect a high poetic quality from such compositions would be ridiculous. Goethe says somewhere that if a poet were to be thinking about his measures while writing his poems, he would go mad, and produce nothing of value. Sidney did not lose his reason, though *terza rima* with a *sdrucchiolo* termination is enough to drive a poet mad; but he produced a vast quantity of verse which is only valuable as illustrating the intense self-consciousness of English poetry at this period. It needed all the "native wood-notes wild" of the dramatists, all the genius of Spenser, to free our literature from the imitative erudition which threatened to strangle it in the cradle.

J. A. SYMONDS.

On the Road to Khiva. By David Ker, late Khiva Correspondent of the *Daily Telegraph*. (London: Henry S. King & Co., 1874.)

It is impossible to read this somewhat bulky volume without acquiring a great liking for the author, whose genuine humour and frankness, and occasional brilliancy of style, cover many faults.

Mr. Ker's map is imperfect, and we search in vain for the "unknown Caucasus," or the "dark ridge up which Codrington's stormers went bravely into the jaws of death looming gauntly against the lustrous sky;" but we gather that our author went from the Crimea to Poti by steamer, travelling with his no-

torious friends the gaunt Cossack, the sallow, beetle-browed Russian, the bullet-headed Tartar, the keen, melancholy Jew, the burly Turk, the aquiline Georgian, the little Fräulein who assumed an air of charming helplessness, swallowing dried prunes by the dozen; and the inevitable English tourist in a plaid suit, whose efforts to arrange the straps of his telescope gave him, according to Mr. Ker, the look of an over-fed Laocoön struggling with a peculiarly thin snake!

Plunging bravely through pages of these sensational sentences, we find our author at Poti, which he amusingly describes as follows:—

Local Products . . .	Fever and cholera.
Revenue . . .	Varying according to the success of the overcharges.
Manners . . .	None.
Customs . . .	Very hard to pass with luggage.
Chief Articles of Use . . .	Quinine.
Internal Communications . . .	Impossible.
Government . . .	Every man for himself, and the devil for all!!

From this miserable sea-port town Mr. Ker hurries on to Tiflis, finding post-chaise travelling as agreeable as sea life, and meeting a few more aquiline Georgians, bun-faced Tartars, and skeletons of ancient Georgian castles hanging shadow-like upon the very brink of black scowling precipices.

He encounters a thunder-storm, which he describes in simple and really effective language, and afterwards sleeps as soundly as a country policeman on duty. From Tiflis he reaches Petrosk, then Astrakhan, and finally ascends the Volga, which he paints (at p. 36) in colours which offer an effectual warning of "don't" to all those desirous of following in his footsteps.

Branching off from the Volga to Orenburg, he passes through a scene of famine, meeting a crowd of peasants moving in slow and melancholy procession; in their midst the long dark robe and flowing hair of a priest, with the crucifix glittering in his uplifted hands.

"What's all this?" ask I.

"We're praying for rain," answers my driver in the dull weary voice of a man without hope, "but it never comes. God is angry with us, and we must just suffer. What is to be will be!"

"Are you fearing for the harvest then?"

"Ah, master, how can we help fearing for it? Twice already our crops have failed, and now this third time there's been no rain for weeks together, and the ground is as hard as iron. If the harvest fails again *this* year, God help us all!"

"And then in a few simple touching words he tells the dismal story. Two bad harvests in succession, seed-corn becoming dearer—dearer still—and at length failing altogether; food purchased at exorbitant rates from the harpies who are never wanting to fatten upon the misery of provincial Russia; men scattering over the whole face of the country in quest of work to keep them from dying of hunger; long weeks of gnawing anxiety, sinking at length into the apathy of despair. And all the while he is speaking the mournful cadence of the people's prayer rises and falls like the moan of a distant sea, and the poor creatures turn their longing eyes to the clear bright merciless sky, which looks down upon them as if in mockery."

Leaving this unhappy district, our author hurries on to Orenburg—the "gateway of Asiatic commerce"—and thence to Fort Kazalinsk, a journey which is described as:—

"The heat of a furnace during the day, the damp of a Lincolnshire fen at night, an atmosphere filled with hot prickly dust, a quivering blaze of intense heat along the horizon, lips cracked and bleeding, eyes that ache with a dull unceasing pain, a furred leathery tongue, a torturing thirst, a feverish unrefreshing sleep, a constant irritation worse than the sharpest agony."

He reached Fort Kazalinsk on the 17th of June, 1873, but only to find himself, in his own language, "trapped," that is, doomed to spend six weary weeks under surveillance during which the main object of his journey, the campaign in Khiva, became a thing of the past. Mr. Ker gives his experiences of these six weeks in one hundred and nineteen pages. He meets a great many more hook-nosed Kirghiz, high-cheeked Khivans, bun-faced Kalmucks, stately Bokharists, low-browed Russians, bullet-headed Tartars, and other tall, gaunt, hard-featured men; and he gives us an interesting story of the arrival at Kazalinsk of twenty-one rescued Russian prisoners. How gladly the poor fellows entered their fatherland once more, and how mixed were their feelings between gratitude for their safety, and bitter remembrances of their captivity, is narrated in touching language.

Our author tell us they attribute to the Khivans the same fighting qualities which have distinguished most of the other races whom Russia has as yet encountered in Central Asia. "They fight—why, a barn-door cock would chase any ten of them."

Did Mr. Ker, on hearing the story, so well told by him, of the return of these Russian prisoners, remind his companions of the events of thirty years before, when Todd successfully induced the Khan of Khiva to set at liberty 416 similar Russian prisoners whose detention had been made a just pretext by Russia for invading that country in 1839? Did he bring to their remembrance the honoured names of James Abbott and Richmond Shakespear, subalterns of the Bengal Artillery, who were chiefly instrumental in this good work of restoring Russia's children to her bosom, and inducing her to give back to the Khivans 2,000,000*l.* worth of merchandise and forty prisoners, among whom were representatives of the wealthiest families in Khiva?

A reference to this illustrative tale of England's influence in Central Asia thirty years ago, would have been a worthy addition to an interesting episode.

On August 7, our author realized the good fortune of being allowed to proceed on to Samarcand. He meets a few more of those awful Caucasus-like fortresses, which looked blankly down at him through their gaping walls, with a fixed stare, like the eyes of a corpse, and with an effect indescribably weird and unearthly; also some more broad, yellow-haired Russians; with a few gaunt, swarthy, aquiline Cossacks; and ruins of citadels looming gauntly against the sky; in addition to an old lady, who looked not unlike an over-roasted snipe; a long procession of cows stepping daintily and noiselessly along, surveying the Laocoön-group in the middle of the road with a quiet, aristocratic contempt, which was worth going a mile to see; and some more gaunt, wild-eyed, half-naked boatmen; a few gaunt,

brown scarecrows, and some gaunt der-vishes. At last he enters the "Earthly Paradise"—Samarcand.

In order to acquire a proper idea of this ancient city of Timur, Mr. Ker tells us to

"take a paved court about the size of Portman Square, wall it in on three sides with St. Paul's, Westminster Abbey, and the front of Christ Church, painting all these with every colour of the rainbow. Cram into this space the entire stock-in-trade of Covent Garden, people it with the Shah's suite, the Japanese embassy, and the last caravan from Mecca. Fill in the picture with a rich southern sky, and a temperature of 93° in the shade, and the product shall be a faint outline of the thing required."

Samarcand appeared to produce a great many more tall, stately Bokharists; lumpy Bashkirs; gaunt, keen-eyed Cossacks; veiled women, who looked like exaggerated slate-pencils; and camels, whose grunting was suggestive of a pig shut up in an organ pipe. After several interesting chapters of his personal experiences, needlessly spun out in the same tiresome style which characterises the rest of the book, Mr. Ker ends with a sentiment which we cordially endorse:—

"If what I have said suffices to show that, whatever errors I may have committed, I at least did my best to accomplish the work for which I was sent out, I shall be more than repaid for all."

We do acknowledge this, with the hope that next time he travels he will give us less of himself, and follow the practice, which he deprecates in his first page, of writing a fuller account of the politics, history, and general condition of the country, including the thousand other interesting facts incidental to an almost unknown country.

Mr. Ker's chapter on the future of the Oxus (chap. xxii.) is exceedingly interesting. We can only come to one conclusion, after reading it, in regard to the long-discussed possibility of turning the course of that river again into the Caspian—and that is that "the river, shrunk as it is, cannot muster a volume of water sufficient to reach the Caspian." We have undoubted authority, however, for believing that for two centuries, from the end of the fourteenth century to about 1558, the Oxus did fall into the Caspian Sea. The Englishman Jenkinson, who visited Khiva about this latter period, wrote that

"all the water which they require in the country is drawn in canals from the Oxus; hence it happens that the river no longer falls into the Caspian Sea, and the country runs the risk of one day becoming a desert, for these people will continue to destroy the course of the river with their canals."

An article in the *Russische Revue* (vol. ii., 1873) contains lengthy and most interesting arguments on this point, and arrives at the conclusion, that there is little or no chance of connecting the Aral and the Caspian by the Oxus, except by crippling the forces of nature which have heretofore had effect in the history of the river, and attempting a work at enormous cost, which could not last for long in the loose soil of the lowlands of Khârizm. Whether or no, it seems difficult to believe that the Oxus can ever acquire importance as a commercial highway, although it may play an important part in a military sense.

Mr. Ker's final chapter on the "coming struggle" is instructive, and worthy of study on the part of Central Asian politicians. The few facts, also, which he mentions cursorily throughout the book—such as the tone of the Russian press (p. 19), the composition of the Russian army (p. 41), Russian designs against Kashgar (pp. 53 and 217), the qualities of the Russian soldier (p. 209), the fertility of Central Asia (p. 219), &c., &c.—are oases in the desert of the road to Khiva, which go far to reward one for reading the book.

"Well," says a Russian veteran (in p. 90), uttering, according to Mr. Ker, the opinion of every military man in Central Asia in regard to England and Russia—

"you see, we've got too close now to be very good friends. Men can be friendly enough when there's a good distance between 'em, but when they come to touch elbows they're apt to jostle each other."

We lay down the book with thoughts carried back to 1838, when Nesselrode wrote the same memorable words to Palmerston, words followed by the ill-timed and unfortunate expedition against Khiva in 1839; and a long subsequent period of conquest up to the Oxus:—

"Great Britain, like Russia, must have at heart the same interest—that of maintaining peace in the centre of Asia, and of avoiding the recurrence of a general conflagration in that vast portion of the globe. But to prevent this great calamity it is necessary carefully to maintain the tranquillity of the intermediate countries which separate the possessions of Russia from those of Great Britain, not to excite them against each other by nourishing their mutual animosities; finally, beyond everything else, to respect the independence of the intermediate countries which separate us. Such is, in our opinion, the system which the two Cabinets have a common interest invariably to pursue, in order to prevent the possibility of a conflict between two great Powers which, that they may remain friends, require not to touch each other, and not to come into collision in the centre of Asia."

O. T. BURNE.

Mohammed and Mohammedanism: Lectures delivered at the Royal Institution. By R. Bosworth Smith, M.A., late Fellow of Trinity College, Oxford, and Assistant Master at Harrow School. (London: Smith, Elder & Co., 1874.)

(*Second Notice.*—MOHAMMADANISM.)

IN our first notice of these Lectures, we confined our attention to the second lecture, and endeavoured to sketch the outlines of Mohammad's character, and to show in what our view of that character differed from Mr. Bosworth Smith's; and we found that the difference related solely to the latter days of the Prophet's career. We must now pass on from the Man to the Teaching—from Mohammad to Islām.

It is no easy thing to form a just estimate of Mohammedanism. We are apt to forget the time in which it had its birth, and to compare the somewhat crude and barbarous notions of the seventh century with the more polished ethics of to-day. We forget that when Mohammad preached the Unity of God, the Christians of Arabia were worshipping what to any but theological minds

seemed to be three Gods. We forget the bottomless degradation of that time, and the sensuality amid which Mohammad was born and lived—out of which we surely ought not to expect a religion of virgin purity. But, besides this difficulty of making due allowance for the circumstances in which Mohammedanism sprang up, much is attributed to its founder which was, in fact, pre-existent in Arabia, and so much has since grown fungus-like upon Mohammad's teaching, that it is hard to tell what is the genuine thing, and what is the casing of mud which the centuries have heaped about it since Mohammad first preached the Religion of Resignation.

It has been said by one who knows the Mohammedan East as no other Englishman does—or can, now that Western contamination is fast spreading its slime over the "Morning-land"—that Islām is like an eastern city. From a distance you see within the gated wall only the matchless domes and minarets of the mosques, and here and there a picturesque malkaf on the flat roof leading the cool northern breezes down through the house, and perhaps a massive citadel towering over all. But go near, and you find ruined houses and dilapidated mosques; noble palaces, with their treasures of eastern art, falling into decay. So is it with Islām. Its outlines are grand; its details at times heart-sickening. As a religion it is lofty: as a social system it is a complete failure; and the social system is woven too closely into the religion to be separated from it. And here it is pertinent to remark, that high as the teaching of Mohammad was, its influence for good upon the morality of its followers has been far from proportionate. It may be said of every creed, that if tested by the lives of its professors it suffers; but in Islām the discrepancy between the creed and the life is too glaring. A man may in Muslim countries be guilty of almost every crime which it is possible to commit, and yet be winked at by the law, and it must be remembered that law in the East means the Kurán and the religious traditions. Surely this points to some radical fault in the religion: difference of race will not account for everything.

Mr. Bosworth Smith's view of Mohammedanism is, we think, on the whole, a just one; though, perhaps, a little too favourable. He does not seem always to see the dark side of the question. In vindicating Mohammad's religious teaching, he sometimes attempts to justify the social system which Mohammad sanctioned; or at least to exculpate Mohammad from any blame in the matter. An instance is seen in Polygamy.

"Mohammed," says Mr. Smith, "would have more than doubled the debt of gratitude the Eastern world owes to him had he swept it [polygamy] away, but he could not have done so even if he had fully seen its evils. . . . Mohammed could not have made a *tabula rasa* of Eastern society, but what he could do he did. He at least put strict limitations on the unbounded licence of Eastern polygamy, and the facility of Eastern divorce" (p. 174 f.).

This is a mistake, though a most natural one. It is very true that Mohammad did not introduce polygamy into Arabia; but it

is not true that he put upon it "strict limitations." He restricted, indeed, the number of wives; but he allowed absolutely unlimited licence in another and far worse way. What avails to forbid a man to take more than four wives, if he may have as many female slaves as he likes? * So far from limiting polygamy Mohammad virtually left his followers an unbounded polygamy, which differed from that of the usual acceptance only in name, and in the additional feature, that whereas a wife has her father's house to protect her, the concubine is defenceless against the brutality of her master, who may even kill her with legal impunity on the slightest provocation. The number of wives is necessarily limited by the expense of maintaining them with their separate establishments; on the other hand, a female slave costs little to keep and, moreover, commonly works for her living. Is it not, then, obvious, that Mohammad, whilst restricting an evil which was never likely, save in very exceptional cases, to extend much beyond the limits he imposed,† left free scope for a closely-related abomination, which most men could compass, and which must reduce a large proportion of human beings—nay, of women—to a state of miserable and abject dependence on the condescending humanity, instead of the reverence, of the wretch who owns them and has bought them for his own brutish pleasure? Is this limiting? If so, the word "limit" has no meaning. We have said nothing about the facility of Mohammedan divorce, because, as Mr. Bosworth Smith points out, it is the necessary consequence of the separation of the sexes. A man would never embark in the hazardous lottery of Eastern marriage, if he had not the escape of divorce from the woman whom he has never seen, and who may be in every way uncongenial to him.

If we have dwelt so long upon this one subject, it is partly because it is almost the only one in which we seriously disagree with Mr. Smith, and partly because it is *the one fatal point* in the system of Mohammad. The other faults of Islām are comparatively trifling, and often find their counterpart in many of the existing forms of Christianity: but polygamy has degraded the East; it is the bane of Islām.

But if Mr. Bosworth Smith has been misled (like almost everyone else) with respect to polygamy, he is perfectly right about a very kindred subject, the Muslim Paradise

* Sale's statement that the number of wives and concubines *together* was limited by Mohammad to *four* is an error.

† Mr. Bosworth Smith, in quoting the statement which Mr. Lane has made in the *Modern Egyptians*, that polygamy in Egypt was rarer among the higher than the lower classes, hints that the words "higher" and "lower" may have been accidentally transposed. The writer has since had the opportunity of mentioning this to Mr. Lane, who says that no such transposition has taken place. Mr. Lane suggests a very probable reason for the greater prevalence of polygamy among the lower classes: many of them who travel much about the country, such as boatmen and servants, like to have a wife at each end of their journey, and in any case a wife of the lower orders makes herself useful, and not only supports herself, but helps to support her husband. The higher classes occasionally have female slaves instead of more than one wife. By the higher classes are meant those persons who are in easy circumstances.

—which is commonly thought one of the worst features of Islām. This sensual heaven must be regarded rather as forced upon Mohammad by the character of the people to whom he preached, than as natural to his own mind; for though sensual himself, he does not seem to have personally desired a heaven of sense. Witness the third Sûrah (quoted by Mr. Smith):—

“Fair in the sight of men are the pleasures of women and children; fair are the treasured treasures; and fine horses; and flocks; and cornfields! Such is the enjoyment of this world's life. But God! goodly is the home with Him!”

Nor should it be forgotten that some of the higher sort of Muslims in the present day maintain that the descriptions of Paradise in the Kur-ân are not to be accepted in their literal sense any more than are the descriptions in St. John's Book of the Revelation.*

Mr. Smith's remarks on the Mohammadan miracles, on the so-called “conversion by the sword,” and on fatalism, are thoroughly just and clear, and well worthy of study. With regard to the last, we think Mohammad was more of a predestinarian (though not a fatalist) than Mr. Smith admits; an examination of the traditions would, we think, induce him slightly (it needs no more) to modify his view on the subject.

We must now turn to the last lecture, on Mohammadanism and Christianity, in which the author's breadth of view is most conspicuous. The position which Mr. Smith claims for Islām is that of a near relative of Christianity; he would almost say the only form of Christianity which has ever commended itself to the Eastern mind. It is to the unprogressive nations of the East what Christianity is to the progressive nations of the West. And Islām has that power of revival which is essential to a religion, without which it must at last die of corruption. The Wahhábís have done for Islām what the Reformers of the sixteenth century did for Christianity. Mohammadanism, in short, is a not unsuitable religion for an unprogressive race. This is a position which we think can hardly be too strongly insisted upon. Mohammadanism has done for the East, though in a far more imperfect way, what Christianity has done for the West; and unquestionably Islām has raised to no small extent the moral tone of its professors. Yet a religion that countenances such practices as Mohammadanism does, is never likely to raise the moral tone of a nation above a certain point. Up to that point it will raise, but beyond that it will be powerless.

Mr. Bosworth Smith proceeds to argue that Islām may in time be so far broadened and purified as to become a religion such as even a progressive people might believe, if the East ever become progressive. We quote his words:—

“It seems to me that while Mohammedans cling as strongly as ever to their rigid Monotheism, and to their unflinching belief in the Divine mission of their Prophet, . . . they may yet be brought to see that there is a distinction between what Mohammed said himself, and what others have said for him; and that there is a still broader distinction between what he said as a legislator and a conqueror, and what he said as a simple prophet. There are some among

them who see now, and there will be more who will soon see, that there may be an appeal to the Mohammed of Mecca from the Mohammed of Medina; that there may be an idolatry of a book, as well as of a picture, or a statue, or a shapeless mass of stone; and that the Prophet, who always in other matters asserted his fallibility, was never more fallible, though certainly never more sincere, than when he claimed an equal infallibility for the whole Koran alike. Finally, with the growth of knowledge of the real character of our faith, Mohammedans must recognise that the Christ of the Gospel was something ineffably above the Christ of those Christians from whom alone Mohammed drew his notions of Him; that He was a perfect mirror of that one primary attribute of the Eternal, of which Mohammed could only catch a far-off glance; and which, had it been shown to him as it really was, must needs have taken possession of his soul” (p. 230 f.).

This is a noble picture: such a future for Islām would indeed be glorious. Then would the barriers between Christians and Muslims be thrown down; and both together would worship the one God whom they have as yet worshipped apart; both would alike see in Jesus Christ the ideal Man and the Image of the Eternal Love; and both would recognise in the great Teacher of Arabia, who came to bear witness of the Light of which indeed he saw but the afterglow, an unconscious and erring, but real follower of the Founder of Christianity.

Will the East ever rise to this?

STANLEY LANE POOLE.

THE POLITICS OF THE REFORMATION ERA.

Geschichte der auswärtigen Politik und Diplomatie im Reformationszeitalter (1485–1556). Von Karl Fischer. (Gotha: Perthes, 1874.)

HERR FISCHER'S book is a most useful guide to the history of the period of which it treats: it has also the rare merit in historical books of being a short one. In 150 pages the author gives a compendium of the intricate politics of the Reformation era, tracing carefully the alternations in the balance of power, and showing the various objects of dynastic or national policy in that stormy period. The remaining 100 pages are devoted to an essay on the diplomacy of the time, sketching the characters of the leading statesmen and diplomats, and explaining the forms of diplomacy and the means which it employed.

There is not much that is original in the views which Herr Fischer sets forward. In the political part he has followed Ranke; in the essay on Diplomacy he has adopted the results, and even the arrangement, of Von Reumont, in his *Italienische Diplomaten und diplomatische Verhältnisse*. Still Herr Fischer is not merely a compiler: he has worked honestly and independently through the many volumes of State Papers which have been recently published, and he gives briefly and clearly the view of the international relations of Europe which they have left on his mind. The book is one which speaks very highly of the historical school of Germany which can produce such well-trained students. Herr Fischer is full of enthusiasm, and his book, though a compendium, contains much fire and humour, and is never dull. Now and then we see that the writer would have wished to dash out into fine writing, for which he obviously has a

great gift; but his conscience is too strong for his desires: after a few lines of indulgence he checks himself, and comes back soberly to his task; he bethinks himself that he is engaged in unravelling a tangle, and that his duty is quietly to separate the threads, and not to ramble away for his own amusement.

Here and there a few inaccuracies occur, which seem to arise from too great a desire to be graphic. It is no doubt more effective, and more pictorial, to group political tendencies round the person of their most eminent exponent; but this is sometimes dangerous in a text book which aims at helping students. Thus, Herr Fischer is misleading when he says (p. 35), in his sketch of Italian politics at the time of Charles VIII.'s expedition, “Caesar Borgia, the Pope's son, began his career of robbery.” At this period (1494) the Papal politics centred round Alexander VI.'s eldest son, Giovanni Borgia, Duke of Candia: Caesar was only a newly-appointed Cardinal, and it was not till Oct. 1498, when he laid aside the cardinalate, that he became of distinct political importance. Again, it is a needless exaggeration to say of Milan, in the same year 1494: “Giovanni Galeazzo Sforza must die, Ludovico became duke, and the Neapolitan troops were repulsed even before Charles appeared in North Italy.” Charles himself saw Gian Galeazzo in the castle of Pavia. He had passed on to Piacenza when the news of his death reached him; from the King's camp at Piacenza, Ludovico rode off to Milan and was recognised as duke.

These are perhaps small matters, but they show that the book would have been rendered more valuable, because more trustworthy, if it had been furnished with a brief chronological table. The necessity of arranging events accurately in a tabular form is a wonderful check upon hasty generalisation, while an accurate chronological table is the best justification for inferences on matters of politics.

Apart, however, from this, Herr Fischer's book will be found of great use by all who for any reason are studying the Reformation epoch. It is most necessary that the political conditions under which the Reformation movement developed should be clearly understood, before any attempt is made to estimate its meaning. Those who assume its meaning in the first instance, and then advance to investigate its history, soon cease to be critics and become apologists. They disregard the actual forces in operation through their desire to find some countenance in the past for their own present beliefs or disbeliefs. They are so concerned to prove the moral worth of the ideas that animated their own special champion, that they pay no attention to the general moral atmosphere of the time. Against such partial treatment a book like the one before us is an excellent antidote. It looks upon the Reformation not as the result of the spread of any definite speculative ideas, strong in themselves, and gaining ground by the force of the conviction they carried—nor as founded on an overwhelming moral power, which found at that particular period a fitting outward expression for its inward strength; but it regards it as the general result of all the forces anta-

* *Mod. Egypt.*, 5th ed., p. 68, note.

gonistic to the existing political system of Europe.

In the mediæval theory of the ideal unity of Christendom under the Pope and Emperor, the political and ecclesiastical systems had been inextricably interwoven. From time to time throughout the Middle Ages new ideas had appeared opposed to the old system, but the movements founded upon them had been either crushed or encouraged till they ceased to be formidable. In the fifteenth century, however, the antagonism had grown strong. The growing feeling of nationality helped it on the temporal side; the new learning strengthened it on the spiritual side by developing the feeling of individual freedom, and by destroying the speculative basis of realism on which the old system rested. Moreover, the old system itself had become involved in practical contradictions. The Papacy and its influence had prevented the growth of an Italian nationality: the consequence was that Italy lay a helpless prey to the overpowering onslaught of the newly-formed nations of France and Spain. The Papacy itself also had indirectly received a deadly blow to its spiritual influence by the first growth of a system of national politics. For the papal power had flourished in antagonism; it had risen by effort, and had developed its moral strength in proportion to its outward weakness. Now its attitude of direct antagonism was over, for where was its foe and where was its friend among the nations of Europe? Their forces were evenly balanced; their ambition knew no bounds; each was jealously watching the other; no one of them would venture to give its opponents the advantage of the title of "Defender of the Church." The Papacy, free from antagonists, lost its moral force; then, doubtful of its exact position, it plunged desperately into the internal politics of Italy. Representing no nationality, backed by no real power, it dragged through the mire its grand old banner, and degraded the magnificent ideas on which it had been founded.

Similarly, the Emperors had sacrificed to the pursuit of a phantom their noble birthright of the German kingdom. The old mediæval power had passed away, and in its place there stood another, which tried to conjure with the old names, and appealed to the old ideas only to gain its own selfish ends. The dynastic interests and hereditary claims of the Houses of Burgundy, Spain, and Austria had become united in one family, which was endeavouring to weld together its scattered heritage, and so, under the guise of the old Imperial title, to establish a universal monarchy. The Empire was founded no more on common Christian rights and duties, but on the desire for aggrandisement of a selfish dynasty. No longer were Papacy and Empire equal Powers; for, though both had lost in moral meaning, the Empire had gained in material force. Henceforth the Pope was to be a subservient minister, behind the cloak of whose name the Imperial will was to be spread.

It is no wonder that such a condition of affairs stung Europe into a rebellion. Slowly the issue became manifest to the nations' eyes, but first, in its larger meaning, from the ecclesiastical side; slowly did men's pro-

tests become articulate, and the long-felt antagonism find an expression. First in Germany, round Luther's denunciations of Papal abuses, men gathered as round something they could understand. Both Maximilian and Charles V. were glad to have so useful an instrument thrown in their way: by means of Luther they could establish a wholesome dread in the Papal breast, and show the Pope the danger he ran if he swerved from their side in politics. Luther himself had no care for politics, and disclaimed entirely all political meaning. Charles V., with all his wisdom, did not suspect the danger, and saw no difficulty at first in combining Luther's teaching with his own political designs. The great weakness of Charles V. as a politician was that he never understood the German character. Successful elsewhere in breaking down resistance, in balancing parties, in making timely and meaningless concessions, he allowed Luther's movement to advance in Germany till it became too strong. Too late he made an attempt to crush it; but it gathered strength in silence, and what he had hoped to use for his own purposes proved the destruction of his deep-laid plans when they were on the very verge of success.

In conflict with Charles V. the Reformation, in spite of its endeavours, was forced into a position of political importance. In the emergencies of the battle it was compelled to improvise a partial system, developed little by little, as the need was pressing, of curbing fanatical friends, and repelling the onslaughts of wily foes. In the tortuous politics amongst which it struggled into being are to be found the causes of its leading characteristics. It was formed, not by development from within, but by pressure from without. It did not grow by the peaceful influence of ideas, but its shape was forced upon it by the clash of contending political systems and the shock of warring national or dynastic interests.

The age of the Reformation, moreover, was one of deep immorality and unscrupulous intrigue. It is impossible to find amongst the politicians of the time anyone who can be raised to the level of ever so small a hero. To weaken opponents by any means, and to destroy secretly their combinations, were the objects of all statecraft: deceit and subterfuge were the chief methods employed. The politics of different European nations may differ in wisdom, but they differ very little in honesty. Sir Henry Wotton's definition of an ambassador as "a clever man sent abroad to lie for his country," was universally true. A single instance may suffice to show the meaning of political honour. By the treaty of Barcelona, Ferdinand and Isabella promised on their royal word never to enter into matrimonial alliance with England or Austria: at that very time they were concluding the marriage treaty between Prince Arthur and their daughter Catharine. The object of diplomacy such as this was to conceal the real meaning and intentions of those engaged in it. The entire character of Charles V. had been so cast in a mould of diplomatic dissimulation, that none of those around him ever knew quite clearly what his intentions were.

Of all masters of diplomatic craft, Cardinal

Wolsey was the chief. Herr Fischer's description of him is a good instance of the use he makes of State papers, and the way in which he throws together the impressions they produce upon him:—

"For hours together he conversed with ambassadors, so that many a one believed the sly Cardinal had confided to him the secrets of his heart. By a few worthless reminiscences drawn from his active life, or a few feigned or real displays of emotion, which served to build a bridge of confidence between the two negotiators, he often bought at the price of a few counters the last trump card which his opponents held. He carefully avoided making any promises: if the ambassador were too pressing, he entrenched himself behind the King, and, if the King refused the demand, he was never at a loss to account for the refusal by some ill-disposed foreign ambassador. He had at his command such quietness, clearness, and impenetrability, such smooth and plausible address, such expressive warmth of manner, that amongst diplomatists he merited the first place, and in the annals of deceitfulness and perfidy by no means the last."

After such a character of Wolsey, it is not surprising to find that Herr Fischer disapproves very strongly of Mr. Froude's view of Henry VIII. He observes that "it is discreditable to English historical writing that one of its most recent representatives, Froude, ventured to put forward as the chief causes for Henry's determination [about the divorce] considerations which were merely incidental, and calculated to suit Parliament and public feeling." The idea of Wolsey's pupil regarding his divorce as a "moral obligation," puts Herr Fischer into such amazement, that he with difficulty contents himself with charging Mr. Froude with nothing worse than "audacity."

The chapters on diplomacy are full of amusing characters and interesting traits drawn from the despatches of the time. The reader is taken, with little trouble to himself, behind the scenes; his guide is familiar there, and points out the objects most likely to interest a stranger. It is impossible to part with Herr Fischer without a feeling of gratitude to him for having condensed the results of so much sound and honest labour into so small a space. M. CREIGHTON.

NEW NOVELS.

Civil Service. By J. T. Listado, Author of "Maurice Rhyhart," &c. In Two Volumes. (London: Henry S. King & Co., 1874.)

Lady Livingston's Legacy. By the Author of "Lady Flavia," "Lord Lynn's Wife," &c. In Three Volumes. (London: R. Bentley & Son, 1874.)

Papa's Own Girl. By Marie Howland. (New York: John P. Jewett, 1874.)

Beatrice Aylmer and other Stories. By Mary M. Howard, Author of "Brampton Rectory," &c. (London: Henry S. King & Co., 1874.)

Aileen Ferrers. By Susan Morley. In Two Volumes. (London: Henry S. King & Co., 1874.)

With the decline of horse-racing and the suppression of the gambling-tables novelists lose a mine of exciting episodes, and they must therefore be disposed to view with pleasure the progress made by the principle

of competition in all branches of the Government service, and the introduction of the element of chance into lives which had hitherto lain out of their domain; and they have a right to expect that with the reports of commissioners as a text-book, with statistical tables for more advanced study, and with regular attendance in Burlington Gardens in place of visits to metropolitan police-courts and dead-houses of the Thames, they will ultimately make the romance of examination a good substitute for the exhausted romance of love and war. Long ago the genius of Lamb found food for reflection in the lay monastery of the South Sea House; and now Mr. Listado, in his new novel *Civil Service*, has been fortunate enough to unearth a department of the State which attained a high degree of inefficiency in times when "the steady persistency of a few crotchety persons had not yet moulded that wonderful gauge for testing the capacity of men for governing niggers, construing cuneiform inscriptions, still-hunting in Connemara, waltzing at Vienna, or copying letters and bullying lawyers' clerks at Somerset House." This was the golden age of official life. The humours of a mess-room were sober beside the joviality of the Cheque Office, Whitehall, where bumpers were quaffed from morning till night, where schedules were drawn up to an accompaniment of Irish drinking-songs, and where junior clerks found leisure to practise extensively at the bar, and occasionally to stand for Parliament. Of course the whole establishment was not so engaged. Some of its members laid desperate schemes for large estates; others turned to love and ran through three passions in as many months; while the porter, most versatile of all, conducted a private enquiry office, and was as ready to purloin a will as to invest in sporting transactions the money of the young gentlemen. But as the actual work of this important department was no more than sufficient to occupy two short chapters of a novel, Mr. Listado has been forced to transfer his story to the eastern coast of Ireland, where he describes several characteristic scenes with much animation. There are picturesque touches in the encounter with Irish marauders, in the account of the democratic oracle of the village which roused itself once a week to flay the Saxon, and in the election struggles between ladies and priests. But the story is prolix. The three heroines have only one hero between them, and their gallant divides his affections so equally that the matter would have been complicated but for the intervention of the Cheque Office, which arranged that a fellow-clerk of the hero should marry one of the heroines, and that the head of the department should relieve his subordinate of another. These were advantages in the state of good-fellowship existing at Whitehall which must have been overlooked by the crotchety persons who uprooted the system. But at the same time the office might also have supplied the lost heir to the disputed estates and have saved the author from the necessity of relating Irish history from the time of Shan O'Neil. Indeed if a list of the junior clerks, with their ages and dispositions, had been appended to the book, its readers might have

selected their heroes and villains, their rightful heirs and impostors, at their own convenience.

It does not appear from the title-page of *Lady Livingston's Legacy* that it was originally written for a cheap weekly miscellany, and addressed to shop-boys and domestic servants; and as it is published by respectable publishers and bound in respectable binding, we presume that it now, at any rate, seeks readers of another class. Such persons we warn against the book. They have long since made the acquaintance of the villain with steel-blue eyes and a lurking devil behind them, and with "the nameless something in his tone and lineaments which to a heedful physiognomist should have cried beware!" and they cannot be strangers to the woman whose eyes "possessed the attributes of the chameleon" and "had a terrible fascination in their infinite mobility and fierce intentness," and whose voice was "apt to change from the sweetest strains into shrieks of anguish and the laughter of the Lost;" but we doubt if they have met these favourite characters in so unsavoury a novel as this. A book cannot be very pernicious which is unutterably silly. But there is a varnish of culture spread over its follies, an occasional reference to Flemish painters, a line from Lovelace, and the name of a character from Jonson or Fielding, which may cause the unwary to believe that the author has derived advantage from the study of art and literature. No evidence of such study is to be found either in the incidents or in the manner of relating them, while proofs of vulgarity and a barren invention are abundant. We expect from sensational novelists little intimacy with the ways of well-born and well-bred persons, and certainly demand no luxuriance of fancy; but it is hard that the Earl of Snowdon and the Marquis of Blunderbore—the writer's Titius and Seius—should be saddled with the sins of the entire aristocracy, and it is unaccountable that deans and bankers alone should be selected to be "arraigned before the Vehmgericht of servitude," that is, to be talked about in the servants' hall. Of these fine phrases and foot-and-half-foot words there is a large supply. The clouds are "filmy threads of white vapour, some gathered into skeins as though newly twisted by the distaff of Norse Valkyr or Greek Destiny, some woven into webs fit for the winding-sheet of a dead Titan;" ill-assorted marriages are those where "Hate stands ghastly behind bride and bridegroom," and young ladies "tower above their adversaries like grand statues of Scorn." And the matter resembles the manner. Dark deeds having been done in Canada, disreputable people who saw them done come to demand money from the doers. When children have been drowned, and lawyers garrotted, and wills stolen, and there have been "dealings with the Behemoth," as a money-lender is playfully called, one of these disreputable people is hunted to Paris and shot by Communists, to whose credit the recording angel should put the deed. His sister is indicted on a charge of larceny, and is sentenced to a heavier punishment than the statute provides for that offence, the judge doubtless having regard to the possibilities of evil in her chameleon-like eyes.

It is altogether a deplorable novel. Yet, if the convicts of Portland, or the lunatics of Colney Hatch are allowed, or are able to amuse themselves with light literature, *Lady Livingston's Legacy* may still find appreciative readers.

The atmosphere of the American story, *Papa's Own Girl*, is far purer, although it is undoubtedly charged with electricity. The name of the book is that of a domestic tale; its contents those of a housewife's guide, a pamphlet on woman's rights, and a treatise on elementary questions of political economy. The stream of fable runs so quietly that one doubts whether it is not dried up, till a seduction is suddenly thrown into it, and the splash awakens the reader. There are domestic episodes imitated from Miss Burney, little details dressed up in big words, and remarkable theories expounded concerning the nature of the soul, the origin of evil, the necessity of war, the subjection of women, and other matters of high importance. They are put into the mouth of a free-thinking doctor of medicine, who is drawn upon lines which the Vicar of Wakefield and Parson Adams have probably left in the author's memory, but who bears a far stronger resemblance to Mr. Barlowe, the revered instructor of Sandford and Merton. He considers that the world cannot be saved from ruin unless women work out their social salvation and become free. The writer herself, be it said, has taken many steps towards emancipation, and treats delicate subjects in a manner bordering on licence; but she probably agrees with La Bruyère that "les femmes sont extrêmes," and thinks that the freedom of some women is an index to the degradation of others. The doctor adds, by way of corollary to his theory of liberty, that when women are inspired with a disgust for all kinds of murdering, the stupendous imbecility of war will cease; the soldiers will be employed in draining the Dismal Swamp, and the ladies will organise fancy-dress balls to refresh the workers after their day's labour. But when he descends from his stilts he is really harmless, and not more crazy than Emerson's friend who thought that all the evils in the English government were due to the national devotion to musical concerts. Unfortunately his daughter, who has put her father's theories into practice to the extent of running away from her former husband, marries a German Baron with equally astonishing views, who having reflected on the causes of low wages and pauperism in general, builds a social palace for the use of workmen, with a theatre, library, billiard saloon, aviary, conservatory, and establishment for babies. These babies he divides into three classes, and draws up a code of ceremonies, apparently based on the code of Manu, to be observed by the infants in their relations with their superiors and with one another. Mr. Ruskin may be interested in this scheme. It is a remark made by Swift that the Nauplians learned the art of pruning their vines by observing that when an ass had browsed on one it thrived the better.

We had read two of the stories collected under the name *Beatrice Aylmer* before we discovered that the book was addressed to the young. The discovery was satisfactory

to us because the free thinker of the last novel had reappeared and was being demolished with a facility that on any other supposition was marvellous: but it will be less pleasant to the young, for whose benefit dissertations on the writings of M. Renan, on the follies of Ritualism and the evils of Rationalism, have been crowded into the barest framework of story. For adults the arguments are puerile: for children the topic is unsuitable. Otherwise, the book is complacently dull.

But *Aileen Ferrers* would go far to redeem almost any batch of novels from mediocrity. Its unforced pathos and simple language, its delicate contrasts of light and shade, its knowledge of dramatic effect with true insight into human nature, combine to render it an uncommon book. The problem set before the author was whether the strong love which had grown up with the early years of a girl's life could be easily crushed out of it by new associations; and instinct has suggested an answer which psychological reasoning might have missed. Aileen Ferrers has lived for sixteen years among peasants and gamekeepers on a Yorkshire moor, and is already engaged to her cousin Ralph Dymock, when the course of her life is changed by the arrival of Lady Grace Calvert, who has discovered that Aileen is the daughter of a dead brother by a clandestine marriage, and now wishes to give her an education worthy of the position of her father. As soon as Ralph hears of Aileen's "luck," he releases her from the engagement and will not even accept her promise to return after five years. But the girl returns and finds that the gulf between Ralph and herself is not to be spanned: so she gives him up, and marries a friend of her father, a man of forty-five. The book is too short to allow of much evolution of character, but the figures of the girl and her lover are distinctly drawn. Aileen's intentions are always honest, and she keeps her promise steadily before her; yet the crowd of annoyances which suddenly come upon her in the new life, induces her to return to Lonscale almost as strongly as her sense of duty, and then she allows a few slights, which she might have lived down, to weigh against Ralph's unswerving fidelity. The man is made of nobler stuff. In the old days Aileen told him the legend of St. Isel, who threw himself from the rocks of Holyscars to save the people from drought, and while the girl was moved to rapture by the saint's heroism, he merely suggested that "the old chap had probably had a drop too much." Yet it was not Aileen, but Ralph, who made the sacrifice. Of course novel-writing is as much a trade as clock-making, and the author of *Aileen Ferrers* is still an apprentice. But there is a promise of future excellence in such a singularly graceful story, told in such a singularly pure and unaffected style.

WALTER MACLEANE.

MINOR LITERATURE.

Poetical Works of David Gray. (Maclehose.) In this new and enlarged edition, which it was the last work of the late Sheriff Bell to superintend, his memoir is replaced by the speech which he delivered at the inauguration of Gray's monument in the Auld Aisle at Kirkintilloch. If he had

lived, he had intended to prefix to the new edition a final memoir and criticism, which would have fixed Gray's memory in the right place. He was quite important enough to deserve loving study, not so much for his work as for his temperament. His insight was in the main the insight of Wordsworth, his passion was in the main the passion of Keats; when he lost sight of these inspirations and his occasional reminiscences of Thompson and Gray, he only said with unusual fluency and earnestness what every well-disposed young man might say if he pleased. With this kind of endowment he had an intense consuming impulse to be a poet, and this gave a deceptive fervour and brilliancy to his work. If he had lived, he would have probably subsided into a *littérateur*, like a much more considerable writer, Alexander Smith. It would probably have been kind to point out to him that impulse and faculty may exist separately, and leave him to consider whether his impulse implied proportionate faculty. If he had decided that it did not, it by no means follows that he ought to have altered his course; it is often a great waste of force to resist an innocent impulse, and, generally speaking, those who feel a strong impulse to ideal work for which they are ill-fitted, are not fit for practical work at all. On the whole, it is better that half-developed young men should make indifferent poems, than that they should make indifferent sermons or calico; and that half-developed young women should make indifferent novels, than that they should make indifferent bonnets. Bonnets, sermons, and calico, under the present dispensation, are all necessities of life; and should be made solidly and with conviction by workmen and workwomen whose natures are well developed all round.

History of French Literature. By Christiana Bridge. (London: Rivingtons, 1874.) A manual of the history of French literature has two possible uses: it may serve as a kind of guide to the student, or it may be meant for the use of schools. It is true that the history of literature as taught in school manuals is the most arid of all possible studies. It always happens that but a very small portion is read, and of that portion all that remains in the youthful mind is the memory of a name or two, *nominis umbra*. But as teachers will go on using manuals, they might as well be made accurate, and at first hand. Now the adapter of this compendium from the French of Demogeot, quotes Ampère from Hallam, and finds in the eleventh number of the *Quarterly Review* one of her most recent authorities. We have not observed any sign that she ever heard of Léon Gautier or Gaston Paris. Again, it might possibly interest boys who were reading Homer to find that French literature, too, had its heroic age, so like and so unlike the heroic age of Hellas. But no boy would find this out from the part of the manual devoted to the cycle of Charles. Nor would he gather from the brief notice of Ronsard that he was a sweet and musical lyric poet; his sonnets are not even mentioned. In a very different branch of literature we are told that Bodin's *Republic* was "the beginning of political speculation in Europe." After this we cease to look further for information, and are constrained to comfort ourselves with the reflection that if manuals are disagreeable to learn, they are happily easy to forget.

A BOOK which should teach the whole art and mystery of conduct—in fact, a "manual of manners and morals"—has long been what is called a felt want. This want Dr. Nichols comes forward to supply with a little work called *How to Behave*. (London: Longmans & Co., 1874.) If any gentleman is still ignorant of the proper use of a towel, if he likes to see "his mistress eat bacon or sausages," if, though "a well-meaning person," he does not "carefully avoid every tendency to the deadly sins" (p. 48), if he is doubtful about whether he should dye his hair, Dr. Nichols will instruct him, correct his taste, confirm his morals, and assure him that "dyeing the hair is doubt-

ful" (p. 32). What more frequently occurs to the young than to want to break off an engagement, and yet how few of the more ordinary difficulties of life are so perplexing? At once the neophyte consults Dr. Nichols: "The thing to do is to throw oneself upon the generosity of the other party, who should think it a happy escape." It is also refreshing to learn that every one "can ask anyone to dance." But it is sad to hear from a person of Dr. Nichols' experience that within his memory "the standard of manners in England and America has visibly declined." Is it possible that American society has sunk below the tone of Mr. Scadgers and Hannibal Chollop? In England, of course, as the *Contemporary Review* was at some pains to prove, the younger tutors at the universities have degraded public taste. But there are compensations. "Indecency of language is banished from all decent society." "At the same time there is less squeamishness in the serious discussion of important though disagreeable subjects than formerly." This is as it should be. To descend from morals to manners, we learn that "there is abundant hand-shaking among the Germans. The English and French are more properly reticent." What reticent hand-shaking may be we do not know, but very probably Dr. Nichols has dealt with the subject in his other book on *Esoteric Anthropology* ("Mysteries of Man").

Madame Veuve Lutèce. Par Xavier Aubryet. (Paris, 1874.)

Le Quatrième Napoléon. Par Léonce Dupont. (Paris, 1874.)

THESE two books, which have happened to come under our notice together, are connected otherwise than by this chance bond. In the first place (though this concerns us very little or not at all), they are both, in somewhat different ways, Bonapartist *plaidoyers*. Secondly, which perhaps does concern us, they illustrate with remarkable clearness two very opposite and, at the same time, very salient points of that *esprit gaulois*, whereon its possessors are wont to pride themselves so greatly.

Madame Veuve Lutèce is a very odd book. We cannot help fancying that M. Xavier Aubryet intends us to supply another explanation of its rather far-fetched title than that which he gives us. Paris is "widowed" he says, during the two months of the year when everybody is out of town, but he implies also that she is knowingly or unknowingly wearing weeds for the Empire. The two or three dozen essays, sketches, and what-not, which go to make up the volume, form a most extraordinary jumble. After a *coïnonnerie* (as Voltaire would have said) about gorillas, we stumble upon a perfectly serious defence of the inhabitants of Auvergne in general, and M. Rouher in particular, against the base calumnies and sarcasms of other Frenchmen. On one page we have a laboured but not unamusing depreciation of Summer; on another we find a solemn vindication of Champagne (the wine, not the province), without a trace of irony, and apparently composed for some wine-merchant's circular. The whole is thickly peppered with witticisms old and new, good and bad. For instance: "Il en est du soleil comme d'un petit enfant: tous deux sont charmants quand ils sont couchés." "La bière, c'est la pluie interne." "Le gaz, c'est le sinapisme de la lumière," where, to be sure, M. Aubryet is not at his happiest: it would be difficult to go farther for an image, and hardly possible to fare worse.

The other book is an adoring biography of the Prince Imperial, in which the author's enthusiasm has unluckily overstepped the sublime. One example will perhaps suffice. When the news of the Prince's birth arrived in the Crimea, it seems that the allied armies and the Russians saluted. "Ce qu'il y avait surtout de touchant," says M. Dupont, "c'était de voir cette artillerie jusqu'alors si meurtrière, et ces canons si pleins de rage les uns contre les autres, s'adoucir tout-à-coup et fraterniser devant un berceau."

Would any one but a Frenchman have ventured to call gas a mustard-plaster? Could any one but a Frenchman have solemnly drawn the touching picture of cannon fraternising in front of a cradle? EDITOR."

NOTES AND NEWS.

MR. BEAVINGTON ATKINSON has, we believe, in preparation another volume of art criticism of a popular kind. It will probably be called *Among the Painters*.

WE hear that Mr. Peter Bayne—who is the author of those studies of historical characters, statesmen and poets of the middle of the seventeenth century, which have been appearing from time to time in the *Contemporary* and *Fraser*—is now engaged upon an *étude* of Charles the First, which will shortly appear. The articles will doubtless eventually form a connected work.

THE first Part of Mr. Halliwell's new Materials to illustrate the Life and Works of Shakspeare, will be mainly on *The Two Gentlemen of Verona*, a play which Mr. Halliwell now holds to be wholly Shakspeare's; but the Part will contain several documents relating to the theatres in which Shakspeare acted, as we have already mentioned. Mr. Halliwell will also point out the one remaining unexplored source where Shakspeare's manuscripts, if any, may possibly be found.

MR. RICHARD SIMPSON's first paper to be read before the New Shakspeare Society, will be, "On the Political Use of the Stage before and at Shakspeare's Time."

DR. JAMES RUSSELL LOWELL's resignation of his Professorship of Belles Lettres at Harvard two years ago, has never, we are glad to hear, been accepted by the authorities of the College. Dr. Lowell will therefore resume his old post at the beginning of the October term, though under somewhat altered conditions, which will relieve him from the strain of continuous class-teaching, and leave him free for higher work.

PROFESSOR DELIUS has coupled with *Mucedorus* in the part of his *Pseudo-Shakspeare'sche Dramen*, just issued, "A Pleasant Comedy of Faire Em, The Miller's daughter of Manchester: With the love of William the Conqueror," from the edition of 1631, "London. Printed for John Wright, and are to be sold at his shop at the signe of the Bible in Guiltspur street without New-gate."

THE Rev. Dr. Richard Morris's *Elementary Lessons in Historical English Grammar, containing Accidence and Word-Formation*, is just ready. The book is quite a new one, and not only the author's well-known *Historical Outlines of English Accidence* cut down. It is clearer in arrangement and its statement of principles, while almost all the illustrations or examples have been collected from the new books that Dr. Morris has edited or searched since writing his former work.

MESSRS. FRANK and WILLIAM KERSLAKE have in the press *The Poems, Plays, and other Remains of Sir John Suckling*, with a copious account of his life, an appendix of illustrative papers, and two portraits. *The Complete Poems and Plays of Thomas Randolph*, now first collected, with some account of Randolph, and a portrait. Also, for publication in November next, the whole works of Samuel Daniel: an entirely new edition, with a memoir (including unpublished letters), inedited notes by Coleridge and Lamb, and a portrait.

WE are asked to make known that the Shaksperian models and relics of the late Mr. S. Aldred are on sale by his widow, at 38 Fetter Lane, E.C. Among the models are:—1. Shakspeare's House, surrounded by scenes from his principal plays, forming a complete picture of the Shaksperian Jubilee, held at Stratford-upon-Avon in 1830. This model was in the great Exhibition of 1851 (Class 30, No. 235), and represents Shakspeare's house as it stood in his own time (1564),

taken from authentic prints; and on the other side as it appeared at the time of the jubilee. 2. Anne Hathaway's Cottage. This model was exhibited at the Exhibition held in the Agricultural Hall in 1864. 3. The Tomb of the Capulets (depicting the death scene in *Romeo and Juliet*). 4. The Ghost Scene in *Hamlet*. 5. Relics: a plaster cast from the tomb of Shakspeare, one of the only three ever taken; also a similar cast of Anne Hathaway's tomb.

MR. FURNIVALL has undertaken to deliver an address on "Shakspeare, the Progress of his Mind and Art," at Stratford-on-Avon, on Sunday, July 26, to the members of the National Sunday League, on the occasion of their excursion to Stratford.

THE Professors of the Universities of Strassburg, Freiburg, Heidelberg, and Tübingen met together on May 31, at Baden, to hold a general jubilation, partly academical and partly social, in the course of which many loyal speeches for Fatherland and Emperor were delivered, and various resolutions passed for the combined action of the universities to foster learning and promote intellectual and spiritual freedom. Gatherings of this kind are becoming more and more common in Germany, where the spirit of festive association seems to have seized upon every profession, trade, or calling, threatening to swallow up the time and strength of the nation in the celebration of a never ceasing round of gold and silver jubilees. Every conceivable event in life, whether it be the taking of a degree, marrying a wife, fighting a battle, writing a book, or a song, entering upon a vocation, whether in diplomacy, shoemaking, or any other line—all and everything falls under the spell, and is liable to be made the object of commemoration every year for half a century after its occurrence, to say nothing of the solemn and grandiose celebration of dead-men's birthdays, and national festivals of every shade of importance. Seeing that the German papers daily print notices of such commemorations, we have thought that the calendar of German associations was filled up: it would appear, however, that a stray calling here and there had still been left unrepresented on the rolls of annual jubilation, for we observe that the *Allgemeine Zeitung* announces in italics that the German hotel-keepers will solemnise, in the course of the present month, their *first* jubilee; and we understand that the *cellners* and porters intend to follow in the steps of their masters.

It appears that France possesses an Academy of the Sonnet, which publishes a yearly almanack, and congratulates itself on having at last discovered one ground on which Frenchmen can meet without quarrelling. The first sonnet in French is said to have been written by Marot in 1520. It is dedicated to Pomponio Trivulce, Governor of Lyons, and may be worth quoting as a curiosity:—

"Pour le may planté par les imprimeurs de Lyon devant le logis du seigneur Trivulce.

Au ciel n'y a ne Planette, ne Signe,
Qui si a point sceut gouverner l'année,
Comme est Lyon la cité gouvernée
Par toy, Trivulce, homme cler et insigne.

Cela disons pour ta vertu condigne,
Et pour la joye entre nous demenée
Dont tu nous as la liberté donnée,
La liberté des trésors la plus digne!

Heureux vieillard, les gros tambours tonnans
Le may planté et les fifres sonnans,
En vont louant toy et ta noble race.

Or pense donc que font nos volontez,
Veu qu'il n'est rien jusqu'aux arbres plantez,
Qui ne t'en loué et ne t'en rende grace."

A LATE number of the French *Notes and Queries* contains some remarks on the French translations of the *Pilgrim's Progress*, which are of special interest at the present time. Bunyan's great work has appeared in French under at least three titles:—

(1) "Voyage du chrétien et de la chrétienne vers l'éternité bienheureuse."—Neufchâtel, 1716; Bâle,

1728; Halle, 1752; Colmar, 1821; Valence, 1825; Toulouse, 1852; Paris, 1863.

(2) "Pèlerinage d'un nommé chrétien, écrit sous l'allégorie d'un songe."—Paris, 1772; Lyons and Paris, 1820, 1824; Paris, 1821.

(3) "Pèlerinage du chrétien à la cité céleste," 1831.

This list of editions is incomplete. The correspondent of *L'Intermédiaire* remarks that it is evident from the publishers' names and places of publication, that the editions entitled the "Pilgrimage" are Catholic, and those entitled "The Christian's Journey" Protestant.

AN official report recently issued contains some noteworthy information on the subject of parliamentary reporting in foreign countries and in the colonies. We learn from it that the debates in the French National Assembly are reported by a regular official staff of shorthand writers in the employment of the Assembly itself; and that no unofficial newspaper has, or would be allowed to have, its own regular shorthand writers. Every speech, it is intended, shall be reported *in extenso* and *verbatim*, and interruptions, expressions of applause, or the contrary, and all the little incidents of the sitting, are inserted. Members have an opportunity of correcting the reports of their speeches during the night before publication. A short analytical report is placed gratuitously each day at the disposal of the Parisian and provincial press. Most of the German newspapers owe their reports of debates to a private undertaking called *Kammercorrespondenz*. These are, as a rule, very inaccurate, but the *Cologne Gazette* has a well organised staff of reporters of its own, whose accounts of the debates are consequently superior to those of the majority. In the United States the practice of officially reporting the debates of Congress at the public expense is of long standing, and members appear to have peculiar powers with regard to the manner of their publication. They can withhold their own speeches for correction, and have them printed, not in the order of the debate, but subsequently, in an isolated form. They can also obtain permission to print speeches without previously delivering them, one regulation of the Senate being that the publication of "speeches not actually delivered shall be postponed until the same can be published without increasing the extent of proceedings beyond forty columns" in the *Daily Globe*.

THE *Nation* states, on the authority of a Hartford paper, that Mr. J. Hammond Trumbull has discovered a hitherto unknown tract of Roger Williams, printed in London in 1652. It formed part of a small quarto of twenty-eight pages, called *The Fourth Paper, Presented by Muir Butler, to the Honourable Committee of Parliament, for the Propagating the Gospel of Christ Jesus*, and was "A Testimony to the said Fourth Paper, by way of Explanation upon the four Proposals of it, by R. W." Internal evidence shows unmistakably that the initials attached to this plea for "soul-freedom" stood for Roger Williams. The tract is said to be unsurpassed in literary merit by any that he ever wrote.

THE *Penn Monthly* for June has an article on "The Merits of Cremation," by Persifor Frazer, in which the arguments on both sides are fairly recapitulated. The writer admits that the result of the adoption of the system of cremation will be small if it is applied only to human bodies, and urges that "to prevent the poisonous influence of decaying life, all animals, from locusts to elephants, should suffer cremation." He asks in conclusion:—

"Do we not owe something to the ethnologists and palaeontologists of the future ages? How can they trace the descent in the modification of races; study the highest fauna of the age of telegraphs; answer the grim objectors of that future day that ever pet question, 'Where are the missing links to connect us with the Indo-Germanic monkeys?' and how can they know in what the structure of a nineteenth century

man differed from that of a bald ape, if we deliberately burn every book in their library?" There is also an article on the Baths in the various cities of Europe, the moral of which is, unfortunately, as applicable to London as to Philadelphia.

ANOTHER good idea comes from Birmingham. The librarian of the Free Library has compiled a catalogue of Birmingham books at present on its shelves which bear in any way on the history, antiquities, &c., of Birmingham, in the hope of obtaining, either as gifts or by purchase, such Birmingham books as are not already in the library. Birmingham has already given proofs of an interest in literary matters which entitle her to the highest praise, and which we should be glad to see emulated by others of our large towns.

ONE of the manuscripts recently sold belonging to Sir William Tite was described as

"Vanderdort's Catalogue of the Collection of Pictures, Medals, Agates, and the like, of King Charles I., removed from St. James to Whitehall. The fair copy made for the King's own use, old calf with the Royal Arms, initials C. R., and date 1639 stamped on both sides, from the Strawberry Hill Collection, with Notes by Mr. Horace Walpole, and view of his seat pasted inside the cover," &c.

Horace Walpole's note in the volume runs thus:—

"This is the fair copy made by King Charles the first of Vanderdort's Catalogue of his Majesty's pictures which were placed in his new cabinet room. The blank leaves have been stuffed with nonsense by some late possessor, who seems to have used it as a common place book. I bought it in November, 1786, for two guineas. "HORACE WALPOLE."

We learn that this volume was secured for the Royal Library at Windsor Castle, where many of the treasures mentioned therein still remain. We may add that a copy of the above manuscript is to be found in the British Museum, marked Harleian MS. 4718.

THE character of that "rapacious bookseller," Edmund Curl, immortalised in the *Dunciad*, is pretty well understood by students of the literature of the early part of the last century. A new illustration of it, however, is to be found in the following letter, addressed by Dean Prideaux to Jacob Tonson, which is to be found amongst some old correspondence lately acquired by the British Museum:—

"Sir,

"I have had another letter from Curl much more abusive than his last wherein he hath these words—Let me know your mind within a post or two or next week, or You will find y^e underwritten advertisement in y^e publick prints.

"Speedily will be published

"Covetousness y^e cause of injustice or an Appeal to my Ld the Bishop and the Clergy of y^e Diocess of Norwich concerning a Book entitled the life of Mahomet written by Dean Prideaux with true copy of y^e several letters we have passed between Dean Prideaux and Mr Curle on this occasion.

"... Misers mis't their store
Still grasp and grasp till they can hold no more
And when their strength is wanting to their mind
Look back and sigh on what they leave behind."—Dryden.

"Thus for this wretch—as to my letters about this business he must forge them, if he hath not that I wrot to you. Upon supposition that he had that answer I wrot him a short letter in 3 or 4 lines to tell him that the right was in you and that I had nothing to doe with it and that is all y^e letters he hath of mine about this matter.

"I desire at any rate to be rid of this villain. You were pleased in your former to tell me that for my sake you would concern yourself no further about this matter, but doe what I should think most for my ease and satisfaction. I thankfully accept this offer, and by the kindness of you to drop this pretension and let him know as much as if y^e life of Mahomet be in your bargain you shall have any satisfaction for your complying with me herein, so that I be not brought upon y^e stage in any contest with so vile a wretch. He tells me he hath Ep. Hoadly's

example for y^e method weh he threatens me with. . . There is no meddling with dirt but some dirt will stick. You cannot oblige me more than by delivering me out of y^e hands of this vile knave. I earnestly desire you to doe soe, and I am

"Your faithfull humble servant

"Norwich

"H. PRIDEAUX.

"March 1st 1717

"For Mr. Jacob Tonson Bookseller at

"Shakespears Head near Somerset House in

"The strand

"London."

A COUNTRY member of the Early English Text Society is reprinting a pleasant old book, "*Apophthegmes*, that is to saie, prompte, quicke, wittie, and sententious saynges of certain Emperours, Kynges, Capitaines, Philosophiers, and Oratours, as well Grekes as Romaines, bothe veraye pleasant and profitable to reade, partly for all manner of persons, and especially Gentlemen. First gathered and compiled in Latine by the ryght famous clerke, Maister Erasmus of Rotersdame, and now translated into Englyshe by Nicholas Vdall," 1542.

By the death of the Baroness Emilie von Gleichen-Russwurm, Schiller's last surviving daughter, the interesting and hitherto unpublished correspondence of the poet and his sister Christophine and her husband Reinwald, has passed into the hands of Herr Wendolin von Maltzahn, under whose direction it will be published in the course of the present year. The letters begin with the year 1782, when Schiller as a homeless fugitive had fled to Bauerbach, where, under the name of Ritter, he had found protection and help in the house of the Frau von Wolzogen. It was here that, encouraged by the sympathy of his friend Reinwald, he wrote *Kabale und Liebe*, completed his *Fiesco* and sketched the plan of *Don Carlos* and *Maria Stuart*. The correspondence, which consists of sixty-eight letters by Schiller, and as many more by his sister and her husband, concludes in 1805, and thus embraces some of the most eventful and productive years of the poet's life.

Naer og Fjern for June 14 contains a little new poem, *Sangfuglen* (The Song Bird), by Ludvig Böttcher, that is so fresh, delicate, and spirited that it is hardly possible to believe that its author is the oldest of living Danish writers, born as long ago as 1793. Böttcher has been writing such lyrics as these, all equally exquisite and original, all his life, but at such long intervals that his complete works are contained in one modest volume. Perhaps in these days to write a little, but to write that little supremely well, is the only sure way to literary immortality.

THE Norwegian medical writer, C. A. Egeberg, born in 1809, died at Christiania on June 7. He was one of the most highly-esteemed of Scandinavian physicians.

It is at last decided that King Christian VIII. will visit Iceland this year to be present at the Thousand Years' Feast. He will take with him two distinguished men of letters, Professor Warsaæ, the well-known antiquary, and the poet, Carl Andersen. This is the first time that a Danish monarch has deigned to visit his most forlorn dependency.

No country is more rich than the kingdom of the Netherlands in public as well as private collections of works referring to its colonies, and recently a movement has been gaining strength in Holland which aims at the foundation of a special national library for Dutch colonial literature. This proposal, which originated twelve years ago with Professor Millies, is now being very strongly advocated by Dr. P. A. Tiele, the learned Orientalist of Leiden, and by Dr. T. Wymalen, of the Royal Library at the Hague, and through their exertions it seems probable that a suitable building will soon be set apart for the purpose, and that the East Indian Colonial Office at the Hague, the Indische Genootschap, and other similar official

and scientific institutions, will contribute their rich stores of charts, books, journals, and other publications connected with Colonial literature, to this projected central library. Should such an institution be organised, the great value of Dr. J. C. Hoogkaas' *Compendium of Dutch Colonial Literature* will assuredly be more and more fully estimated, and all persons interested in the study of the history of the East Indian colonies of Holland will rejoice to find that this important compilation, the publication of which seemed to be indefinitely postponed by the death of its author, is now being carried through the press under the direction of Dr. W. du Rieu, and with the help of Professors Veth, Vreede, Suringar, W. Marshall, and others, under the title of *Repertorium van de Koloniale Literatuur* (Amsterdam, 1874).

MR. CASE'S *Materials for the History of the Athenian Democracy from Solon to Pericles* (James Parker & Co., 1874), gives in the space of a short pamphlet the original statements of Greek authors with regard to those political changes upon which so many pages have been written by historians. Every student of the period will do well to have such a collection at hand with which to test the assertions of modern expositors.

NOTES OF TRAVEL.

THE subscriptions for the support of Lieut. Cameron's expedition, of which we spoke in a late issue, have already reached over 600*l*.

MR. WIGGINS, of Sunderland, has, we hear, sailed for the Arctic regions. Previous to his departure, the vessel in which he sailed was stocked with jams, pickles, preserved meats, &c., by the liberality of Mr. Leigh Smith, who has but lately so distinguished himself in the fields of Arctic enterprise.

THE annual general meeting of the Royal Geographical Society takes place next Monday, the 22nd instant, at 1 p.m., in the hall at Burlington House, and the annual dinner of the Geographers will be held afterwards, at 6 p.m., at Willis's Rooms. The gold medal of the Society will, we understand, be conferred upon Dr. Schweinfurth, the famous African traveller. We regret exceedingly to learn that the courteous and popular President of the Society has determined to resign the presidency, as he finds the work entailed thereby incompatible with his other duties. It is probable that Sir Henry Rawlinson will be re-elected to the post he formerly filled so well.

As a proof of the ubiquitousness of Englishmen, a curious incident is related in connexion with our late mission to Kashgar. While the mission was staying at Kashgar, its members often noticed a man hanging about the house they occupied, whose features were decidedly of a European cast. Being interrogated, he replied that he was a Kirghiz Tartar. This man was temporarily engaged as a mule driver by one of the exploring parties detached from headquarters at Kashgar, and the manner of his being identified as an Englishman is curious. Colonel Gordon had been making some sketches of the strange figures and costumes gathered around the camp, and, as is usual in such cases, soon became the centre of an inquisitive and admiring crowd. Our friend the mule-driver was among these, and looking over Colonel Gordon's shoulder, commenced unconsciously to read aloud the remarks written under the various sketches. Colonel Gordon encouraged him in this for some time, and then, suddenly turning round, said, "You are an Englishman." Upon which, the man put his two hands before his face, rushed away as fast as his legs could carry him, and was never seen by the party again. It was conjectured that he was a Crimean deserter, and, in the interests of geography, it is a pity that he could not have been recaptured and brought back to English soil. His adventures would certainly form a startling history.

ABOUT seven years ago the French decided on opening an industrial exhibition in Pondicherry, the capital of French Asia, but for various reasons it has been postponed year after year. We now learn from the *Pioneer* that some few weeks back the exhibition was an accomplished fact, and for the first time in their lives the people of Saigon in particular, and the native grandes and public of Cambodia in general, were edified by an example, in miniature, of an institution which forms a prominent feature in Western civilisation. The King of Cambodia was welcomed to the exhibition with a salute of twenty-one guns, and no doubt felt flattered on discovering that a main section of the building had been specially set apart for exhibits from his own territories.

WE learn from a French contemporary that the organisation of the International Geographical Congress, to be held in Paris during the next Easter vacation, is being carried out by the Société de Géographie with great activity. The official delegates of foreign nations, whose names have just been sent in to the president of the society, Vice-Admiral Baron de la Roncière le Noury, by the ambassadors of the great Powers, are the following:—For England: Earl Derby, Sir Bartle Frere, and Sir Henry Rawlinson. For Germany: General Beyer, the originator of the International Commission of Geodesy; Baron von Richtofen, president of the Geographical Society of Berlin; Herr Petermann, editor of the *Mittheilungen*; Oscar Peschel, of Leipzig, one of the most accredited professors of history and geography; Kiepert, whose maps and atlas are known all the world over; and Vappäus, author of one of the largest and most important dictionaries of geography. For Austro-Hungary: General Dobner von Dobenau, director of the Military Geographical Institute of Vienna; Admiral Wullerstorf-Urbair, commander of the scientific expedition round the world on board the frigate *Novara*; Count Scezen, Franz Pulski, J. Hunfalvi, president of the Geographical Society of Buda-Pesth, and Hermann Vambery, so well known for his explorations in Central Asia.

THE committee of the Lyons Geographical Society has offered prizes for the successful treatment of the following three subjects:—1. A map on which are marked by certain signs the districts producing silk cocoons, and also the markets of each district for inland as well as for export and import trade. This chart must be accompanied by a memoir containing clear and exact statistical notices. Map and memoir are to be sent in before March 31, 1875, to the secretary of the society, Quai de Retz. The prize for the successful treatment of the work is a medal of the value of 500 francs. 2. A report on a scientific exploration of the Grenoble Alps from a strategical point of view; to be sent in before October 31, 1875, to the same address. The prize consists of a similar medal. 3. An essay on the best means for a more general dissemination of geographical knowledge. Date of sending in, November 30, 1874. Prize: a medal worth 300 francs.

WE understand that the following are the most important provisions of the Treaty of Commerce between France and the King of Annam, which was signed at Saigon on March 21:—Three ports are to be opened to trade, one of which is Hanoi, in Tonquin; and Europeans are to be allowed to settle and hold real property there. Foreigners are to be under the protection of the French Consul, who is to be supported by 100 French troops. Under passport from this official Europeans will be free to travel to any part of the interior. The French seem to be sanguine that the route thus opened through Tonquin to the south-west of China by the Songkoi (or Red River) and its affluents will be preferred to an overland caravan road from the north-east provinces of India. We may remark that Corea is now the only country on the sea-board of Eastern Asia which is not open to foreigners.

WE learn from the *Nation*, that the United States Engineer Office has just issued the first instalment of the topographical results of the explorations and surveys conducted under Lieutenant George M. Wheeler during the past four years west of the 100th meridian. It consists of six plates, photolithographed by Mr. Julius Bien, viz.:—(1) a map of the areas of drainage of the United States territory west of the Mississippi, similar, except in scale and in a few trifling discrepancies, to that prepared for General Walker's Census Atlas by General von Steinwehr; (2) a progress map of lines and areas of explorations and surveys, made under the auspices of the War Department, beginning with Lewis and Clarke in 1804. The region west of the 100th meridian is on this map divided by blue lines into 95 rectangular sections, and the remaining four plates represent in detail (8 miles to an inch) sections 50, 58, 59, and 66—parts of California, Nevada, Arizona, and Utah. A report of the astronomical observations made by the Wheeler Expedition at Cheyenne and Colorado Springs has also been printed.

A FRENCH paper states that some American travellers have just brought out, at the foot of Mount Ararat, a newspaper, entitled *Whiffs of Ararat*. Among other curious facts, we learn from the *Whiffs* that in the Armenian villages a wife may be purchased at from 2*l.* to 16*l.* The peasants believe that the earth is supported on the back of an ox, and that when a fly settles on his head an earthquake is caused by his efforts to shake it off. They are persuaded that impassable barriers surround Mount Ararat, and keep back mortals whose presence would defile that sacred summit, where angels mount guard before an indestructible fragment of Noah's ark.

THE Beyrouth correspondent of the *Levant Herald* states that Lieut. Conder, R.E., commanding the Palestine Exploration party, has left for England for the benefit of his health, but will return at the end of the summer. Mr. Tyrwhitt Drake, the second in command, who with his chief nearly lost his life by Jericho fever, will summer in Damascus, making frequent excursions to the Ansajriah mountains. Our information regarding these highlands is of the meagrest kind, and a rich field awaits the explorer. Professor Payne, the only one person of the American Moabite Exploration party that stood firm, left recently for Joppa en route for the Trans-Jordanic regions, for five or six months, with a view to resuming his archaeological and botanical researches, and he has high hopes of establishing the identity of Mount Nebo. Mr. Jago has just returned from another archaeological tour, which he made with Mr. Cookson, I.L.B.M.'s legal vice-consul at Constantinople, into the highlands of North Syria. The latter gentleman, has, it is reported, extended his journey to Tadmor. It is stated that he has been so fortunate as to discover some interesting inscriptions which will go far to enlighten the hitherto obscure history of those ruined cities which strew the regions of Jebel Zour and Jebel Ala.

THE French Government has recently voted the sum necessary for the formation of a great inland sea in Algeria, 190 miles long by 36 broad, to the South of Biskra. It is thought that the result of this measure will be a great improvement in the climate of the interior, a great addition to the facilities for inland transport, and the introduction of commerce and civilisation into the very heart of Africa. The Chott Mal-Rir (Chott implying the bed of a lagoon), the proposed site of this inland sea, is found to be at least 27 metres below the Mediterranean; while the Chott Sellem, with which it communicates, and which lies between it and the sea, is 13 metres lower still. A chain of Chotts, of smaller area, but equal depression, extends thence to within 18 kilometres of the Gulf of Gabès, and a canal connecting the nearest Chott with the sea would admit the waters of the Mediterranean, and convert the desolate region of

Chott Mel-Rir into a great inland sea. The estimated cost is only fifteen millions of francs, and the engineering difficulties, after the experience gained during the construction of the Suez Canal, would be inconsiderable. A full account of the project is given in the first June number of the *Revue des Deux Mondes*, which has also an interesting article describing a visit to the Diamond Fields at the Cape of Good Hope.

CORRESPONDENCE.

EVE AND THE RIB.

British Museum: June 15, 1874.

IN reply to Dr. Kleinert's letter in the *ACADEMY* of June 6, I must say that when I wrote my letter on the theory proposed by him with reference to the supposed connexion between the Hebrew name of Eve and the Arabic word for "ribs," I imagined, never having heard his name as that of an Arabic scholar, that he had fallen into the mistake of confusing the termination of the word *el-hawani* with the ordinary Arabic dual-ending. My letter has had the good effect of drawing from Dr. Kleinert an elaborate defence of his theory—a defence which I am bound to say removes any notion I may have entertained that the theory arose from a mistake.

I do not write to vindicate myself. Dr. Kleinert has acknowledged that according to the system of the Arab grammarians I am right; and this admission is amply sufficient for me, as I am not anxious to set the writers of the native Arabic Lexicons to rights: I leave that to Dr. Kleinert.

Still I should like to say a few words about this theory. It seems to me an instance of those theories which are excogitated without reference to facts, and to which accordingly facts must give

way. In order to establish his theory Dr. Kleinert has thrown the authorities overboard. Now in a great many things it is highly desirable that the authorities should thus be disposed of; but Arabic is not one of those things. No true Arabic scholar despises the opinions of those learned men who laboured to preserve the Arabic of the classical age in its purity.

One consideration I would draw attention to. In his anxiety to show the connexion in meaning between *el-hawānī* and the root *haw*, "(1) to embrace, (5) to become round, hollow, or vaulted," Dr. Kleinert has entirely overlooked the very obvious similarity between the meaning of *el-hawānī* and that of *hānīyetun*, "bending," or "the bender," the fem. of the *ismu-l-fā'il* of *hād*. But having, on as I think very insufficient grounds, rejected the notion of any connexion existing between *el-hawānī* and the root *haw*, Dr. Kleinert proceeds to eliminate the *nūn* altogether, and to treat the preceding *wāw* as a radical letter, thus obtaining *haw* (or, as he suggests, *hū*). The *nūn* must, however, be accounted for, and Dr. Kleinert therefore supposes it to form part of a dual termination, and looks upon the final long *i* as an irregularity.

I think I have said enough to show that Dr. Kleinert's theory can only be built upon the ruins of the present system of Arabic grammar: and may it not be questioned, *Le jeu vaut-il la chandelle?* If in the allegorical vision of the creation of woman it is necessary to assign some reason for the selection of the rib in particular for the honour of forming the first woman, might we not suggest that Adam could more easily spare a rib than the bone of a leg or an arm?

STANLEY LANE POOLE.

GREEK CHRISTIAN INSCRIPTIONS.

Oxford: June 17, 1874.

I have before me two inedited inscriptions presenting some points of interest. A photograph of the first was lately sent me from Malta by an English clergyman, Mr. Wickham, who did not state exactly where it was found. The other is a small stone of very similar character, which has been some years in the possession of Dr. Acland, who believes it was brought from Egypt by Mr. Wm. Palmer.

The first reads very clearly:—

+ + + + | Ένθα κατάκητη η μακαρία
Μαρίτου ἐτελειώθη Τυβί Ζ ἐν τελευτῇ [i.e. ἐν
τῇ ἐνδικ(τιωνί) ζ]. Ὁ θε(ὸς) ἀνάπαυσον τὴν
ψυχὴν τῆς δοῦλου ἐν κόλποις Ἀβραάμ καί
'Ισάκ καί 'Ιακώβ. Ἀμήν. Ἱησοῦς Χρ(ιστός)
ὁ Ἰ(η)σ(οῦ) Χρ(ιστῇ). +

The second (Dr. Acland's) has some lacunae, and is a good deal rubbed, but may be read with something like certainty:—

* Εἰ[θ]α [κ]ατάκητη η μακαρία Θε[ο]
τότη | η [τ]ελευ[η] | Μιχίρ ἐνδικ(τιωνος) | γ.
'Ο θε(ὸς) ἀνάπαυ[ε] | σγ[?] τὴν ψυχ[η]ν | τῇ [δ]ο[υ]
λης αὐτ[ῆς] | ἐν [κ]όλ[οι]ς Ἀβραάμ καί 'Ισάκ
καί 'Ιακώβ | εἰσκηνητ . . . | . . . ν [Α]μήν.

Dr. Kirchoff, of Berlin, has kindly revised my reading of both these stones to some extent. They belong evidently to a particular class of those Christian inscriptions which he has edited in the fourth volume of Boeckh's *Corpus*. The great similarity between them and the epitaphs from Egypt and Nubia, nos. 9110—9137, leads very strongly to the conclusion that they come originally from that part of the world. They may be taken, in fact, as good types of the whole class, so much so that every word and phrase, excepting the two proper names, has a close parallel or rather counterpart, in the series referred to. Two points are especially decisive. If we may judge by the collection in this volume, Christian epitaphs dated by Egyptian months (such as Mechir and Tybi here) are not found outside these countries, and the formula *ἀνάπαυσον τὴν ψυχὴν ἐν κόλποις Ἀβραάμ*

καὶ 'Ισάκ καὶ 'Ιακώβ is equally limited. The same might perhaps be said of the opening phrase in each.

We may, therefore, place the prayer, "O God, rest the soul of Thy servant in the bosoms of Abraham, Isaac, and Jacob" among the most striking peculiarities which distinguish the inscriptions of one country from those of another. Something *similar*, indeed, is found in two Sicilian epitaphs, nos. 9494 and 9533, but the exact phrase appears to occur nowhere else. It seems to be as characteristic of Egypt and Nubia, as *θηκη διαφύρουσα* is of Palestine, and "famlus dei" of Spain, and the other formulae noticed by M. le Blant in his useful manual, and by Professor Hübner in his Christian Inscriptions of Spain (*Manuel d'épigr. Chrét.*, pp. 75-86; *Inscr. Christ. Hisp.* pp. ix., x.). M. le Blant, I find, gives it in his list, but appears to limit it too strictly to Nubia.

The phrase itself is a remarkable one, being taken from the prayer for the departed in the Liturgy. Such borrowings are by no means rare in Christian inscriptions, especially in this class. As might be expected, it is found in the Coptic S. Basil and S. Cyril, as well as in the Alexandrine (Greek) S. Basil; but, on the other hand, it is not in S. Mark or S. Gregory, the other two liturgies known to have been used in Egypt (cp. Renaudot, *Lit. Orient.* i., pp. 18, 41, 71). It is not, indeed, peculiar to that country, occurring in the very ancient liturgy of the church of Jerusalem (S. James), and in the Gelasian sacramentary (cp. Le Blant, p. 88). It is natural to conclude that this formula, being absent from the earliest Alexandrian liturgy (S. Mark), and present in that of S. James, was first brought from Jerusalem to Alexandria, and then carried across to Rome. The words themselves, in fact, betray their origin on Jewish soil (cp. Lightfoot, *Horæ* on S. Luke xvi. 22). I have gone into these minutiae on purpose to show how much still remains to be done in illustrating the relation of the ancient liturgies to one another by comparing subordinate phrases such as these. I might mention the formulae about the sacrifices of Cain and Abel as similarly instructive.

The name *Μαρίτου* on Mr. Wickham's stone is rather puzzling. I suppose it to be a genitive case of a Roman proper name *Maritus*, and that his daughter's own name was omitted by accident. *Μαρίτα* occurs on an inscription (see Pape), and *Maritus* is found in a Dalmatian epitaph and on British patellae (*C. I. L.* iii. 2687; vii. 1336, 644, 645). In the second inscription *θεοτότη* seems to be traceable on the stone, and not *θεοδότη*, though such a confusion of the dentals does not appear to occur in other specimens of this class. The last two lines are faint and worn. I believe the letters to be *εἰσκηνητ*, but the first three are not absolutely certain. The words probably intended are *εἰς σκηνην* or *ἐν σκηνῇ τῶν ἁγίων*. The formula *ὁ θεὸς ἀνάπαυσον ἐν σκηναῖς ἁγίων*. Ἀμήν, occurs with slight variations in nos. 9111 and 9112; and no. 9113 ends with almost exactly the same letters as we have here, which Dr. Kirchoff leaves unexplained. This last inscription, which was found at Kalabsch (Talmis) in Nubia, is almost word for word the same as Dr. Acland's; and I think we ought to read in it *Τυβί ι ρῃ [ἐ]νδικ(τιωνί) γ* (not *τῇ [ἐ]νδικ(τιωνί) γ*), as the copy in uncials indeed seems to require.

The phrase *ἐν σκηνῇ* or *ἐν σκηναῖς ἁγίων* does not occur in the same connexion in the Liturgies, but may perhaps be found elsewhere in them.

The date must of course be some time after the commencement of the cycle of indictions, which is usually placed A.D. 312, but there seems no reason why it should not be as early as the fourth or fifth century. The era of the martyrs is added frequently in later inscriptions.

I may add a word with reference to the bone tablet found at York with the inscription "Domine Victor vincas felix." Professor Hübner writes that it has nothing whatever to do with Christianity, but is an acclamation addressed to a

favourite of the circus or arena, such as is often found on lamps of clay and glass jars. The date may be of the third century.

JOHN WORDSWORTH.

A LINE IN CHAUCER EXPLAINED.

1 Cintra Terrace, Cambridge.

In the Monk's Tale is a short notice of Pedro the Cruel, the second stanza of which had long been a puzzle to every one, till it was at last cleared up by Mr. Furnivall, in an excellent letter printed in *Notes and Queries*, 4th series, viii. 449. But even Mr. Furnivall could not tell us what *wicked nest* meant, nor why Chaucer used the word *nede* (as in the seven best MSS.), and not *dede* (as in Tyrwhitt), in the puzzling line—

"The wicked nest was werker of this nede;"

nor can I find that any one has ever even ventured a guess of any kind about it.

I think my solution will carry instant conviction with it. Mr. Furnivall shows that two knights were concerned in the matter, viz. Bertrand du Guesclin and Sir Oliver Mauny. A glance at Roquefort's Old French Glossary will show that the old French for *wicked* is *mau*, a variation of *mal*; and that the old French for *nede* is *ni*, a variation of *nid*, Lat. *nidus*. Thus *mau ni* (Mauny) is literally equivalent to *wicked nest*, giving us not only an explanation of Chaucer's words, but confirming Mr. Furnivall's explanation entirely.

But now, why *nede*? I reply that if any one will read over the introduction to the "Ballad of the Death of Don Pedro" in Lockhart's *Ancient Spanish Ballads*, he will find out why. Lockhart thus describes the struggle between the brothers Henry and Pedro: "The rival brethren grappled like lions, the French knights and Du Guesclin himself looking on. Henry drew his poniard, and wounded Pedro in the face, but his body was defended by a coat of mail. A violent struggle ensued; Henry fell across a bench, and his brother, being uppermost, had well-nigh mastered him, when one of Henry's followers, seizing Don Pedro by the leg, turned him over, and his master, thus at length gaining the upper hand, instantly stabbed the king to the heart. Froissart calls this man the Vicomte de Roquetetyn, and others the Bastard of Anisse." Now, what I submit is, that Chaucer had heard, and means to tell us, that this man was *Oliver de Mauny*; in which case he was indeed a *worker* in that which Du Guesclin merely "brew" or contrived, and he was a *worker* in *nede*, i.e. in Don Enrique's moment of dire peril, it being remembered that the old English *nede* commonly means extremity of necessity.

WALTER W. SKERT.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, June 20,	2 p.m.	Fourth Floral Hall Concert.
	3 p.m.	Grand Opera Concert, Royal Albert Hall.
	8 p.m.	<i>Old Heads and Young Hearts</i> at the Vaudeville.
MONDAY, June 22,	2 p.m.	Handel Festival (Crystal Palace): <i>Messiah</i> .
	3 p.m.	Asiatic: Dr. S. W. Bushell on "The Old Mongolian Capital of Shanghai;" Mr. Henry H. Worth on "The Origins of the Manchus;" Captain E. Mockler on "The Transliteration of Persian Words."
	8 p.m.	Revival of <i>Eugene Aram</i> at the Lyceum.
	8.30 p.m.	Royal United Service Institution: Mr. J. K. Laughton on "The Scientific Study of Naval History."
TUESDAY, June 23,	8 p.m.	Anthropological Institute.
WEDNESDAY, June 24,	1 p.m.	Sale at Christie's of the Library and Engravings of the late A. Barker, Esq.
	2 p.m.	Handel Festival (Crystal Palace): Selection.
	4 p.m.	Society of Arts: Anniversary.

- 8 p.m. Geological.
 " Royal Society of Literature: Mr. Vaux on "The Commerce of Ancient Rome with the East."
THURSDAY, June 25, 2.30 p.m. Signor Ardit's Morning-Concert (Hanover Square Rooms).
 6.30 p.m. Royal Society Club: Anniversary.
 8 p.m. Society of Arts: Fourth and Final Conversation of the Season at the South Kensington Museum.
 " Royal Society of Literature.
 " Mr. H. Leslie's Choir (St. James's Hall).
 8.30 p.m. Antiquaries.
FRIDAY, June 26, 2 p.m. Handel Festival (Crystal Palace): *Israel in Egypt*.
 8 p.m. New Shakspeare Society: Rev. F. G. Flay on "The Authorship of the Three Parts of *King Henry the Sixth*."
 " Quekett Club.
 " Mr. C. Hallé's last Recital (St. James's Hall).

SCIENCE.

RECENT BOOKS ON THE HIGHER EDUCATION.

La Réforme de l'Enseignement Secondaire.
 Par Jules Simon. (Paris: Hachette, 1874.)

Die Zukunft der Deutschen Hochschulen und ihrer Vorbildungs Anstalten. Von Dr. Lothar Meyer. (Breslau, 1873.)

Higher Schools and Universities in Germany.
 By Matthew Arnold, D.C.L. Second Edition. (London: Macmillan & Co., 1874.)

THE main difficulties which meet educationists at the present day are fundamentally the same in all civilized countries, however their appearance may be immediately modified by special circumstances. Those who are interested in education for its own sake are constantly obliged to deal with the two great causes of distraction which harass modern society—the race for wealth, and the unsettled state of religious belief. Perhaps the latter of these may be said to be the most obvious cause of perplexity in England, where we hunt down the 25th Clause with all that ardour for the chase which has sometimes been considered a characteristic of imperfectly civilised races. In France, according to M. Simon, both causes are powerfully at work: in Germany it is plain, both from Dr. Meyer's pamphlet, and from other sources of evidence, that the recent strides which have been made towards an increase of material prosperity have to a certain extent carried the nation away from the lofty ideal of culture which has hitherto been its mainstay, and that the most spiritual people in Europe is in danger, while it gains the whole world, of losing its own soul.

M. Jules Simon's most interesting and instructive treatise demands a far more detailed consideration than can be given it in these columns. It professes to deal mainly with the existing defects in French education: it is really a treatise on the present difficulties of education in all countries. A study of this book would serve as an excellent introduction to any one who wished thoroughly to understand these difficulties. An Englishman who has never had the opportunity of studying education in France is not called upon to dwell on those special defects in it, whether of general arrangement, domestic management, or methods of instruction, the existence of which, though before suspected by foreigners, has probably never been more clearly exposed than by M. Simon in

his Circular of September 27, 1872, and in this work, which is a justification in detail of the Circular. We propose rather, as space is limited, to confine our remarks to two points which, though not unconnected with the great problems to which we have alluded, more intimately concern the practical difficulties of modern liberal education, and to discuss M. Simon's method of dealing with them. These two points are the question of examinations and the question of the programme of studies.

In England, it is now commonly said, education is being sacrificed to the examinations. The question has arisen among us, as among the French—How far have examinations done the work they were meant to do? Has their influence extended beyond the limits intended or anticipated? So far as the higher education in England is concerned, the evils of the examination system are at present more keenly felt at the universities than at the great schools. At the universities, as the examinations have become more and more completely organised, the tutors—for lack, as it would seem, of a more genial field of energy—have more and more devoted themselves, not to cultivating the mind, but to exercising the memory and testing the readiness of their pupils. According to M. Simon, the evil has long been felt in the French schools. In the English and German schools, he says, "on prépare à la vie; nous préparons surtout aux examens."

The two chief points up to which the higher school-education leads in France are the *baccalauréat* and the admission into the Ecole Polytechnique. The examination for the latter is competitive, for the former not so. But even the course of instruction for the *baccalauréat* has, according to M. Simon, been excessively dominated by the requirements of the examination, and the teachers, of course, converted into crammers. The programme of studies for the *baccalauréat* has of late, indeed, been considerably shortened; but the evil effects of the older system of overloading the programme still linger. The demon has not been exorcised by M. Duruy's salutary reforms. The examination system for admission to the Ecole Polytechnique is complained of in like manner by M. Simon as pedantic, lifeless, and exacting. For independent mental exercise the exigencies of these examinations leave the boys no room. Meanwhile the *baccalauréat* and the admission to the Ecole Polytechnique are social prizes, and the youth of the richer classes are accordingly driven into the race to attain them. Few things are more vivid than M. Simon's sketch of modern French society—(might not the description be applied to English society as well?)—with its feverish race for wealth and position absorbing education and hurrying it into its own grooves, its hypocritical moral pretensions and unspiritual practice:—

"Le privilège des moralistes est d'émettre des vérités sur lesquelles tout le monde est d'accord, et leur malheur, quand ils vont à l'attaque d'un usage très-répandu, c'est d'avoir beaucoup d'approbateurs et peu de disciples. Parmi tous les auteurs qui ont écrit sur l'éducation, je doute qu'il y en ait un seul qui ait omis d'avertir les parents qu'ils doivent songer avant tout à l'avancement intellectuel et moral des leurs enfants, et ne se préoccuper que

d'une façon très-secondaire de leur avancement dans le monde. Les pères de famille s'associent à l'unanimité à cette propagande vertueuse. On dirait un peuple de stoïciens. Malheureusement, tout s'évapore en beaux discours. On se fait grand honneur en répétant ces admirables sentences; mais personne ne s'en nourrit et alimente:—

"*Mens bona, fama, fides.* Hæc clare et ut audiat hospes:

Illa sibi introrsum et sub lingua immurmurat."

It is, after all, the public which is the great sophist.

M. Simon looks to a shortening of the hours of study and an abridgment of the educational programme as a main remedy against the tyranny of examinations. And this brings us to the second practical point which we promised to consider. What subjects can be excluded from a liberal curriculum? Languages and literature, ancient and modern, history and geography, ancient and modern, mathematics, the natural sciences, art—all these are lawful and expedient, and it is to be wished that all were possible. The old curriculum of classics and mathematics is now, it may fairly be said, accepted by no one as a complete system. A cry has arisen, both from practical men and from the friends of education, for the communication of a larger amount of knowledge. But how to meet that cry, how to provide a system corresponding to the vast dimensions which knowledge is now attaining in all departments, is a problem which cannot be said to have found, as yet, a satisfactory solution. Neither the "modern schools" in England nor, we believe, the *Realschulen* in Germany can be considered as providing an altogether satisfactory equivalent for the thoroughness of the old classical training. M. Simon shall give his own account of what has happened in France:—

"Je rappelle maintenant que le cours ordinaire des études, dans un collège de plein exercice, dure neuf ans, et que, pendant ces neuf ans, il faut avoir appris le français, le latin, le grec, une langue étrangère, l'histoire ancienne et l'histoire moderne, la géographie, la philosophie, l'arithmétique, les éléments de la géométrie, de l'algèbre, de la physique, de la chimie et de l'histoire naturelle; le dessin, la gymnastique, comprenant autant que possible la natation, l'escrime et l'équitation, et enfin l'exercice militaire. La musique, qui est obligatoire en Allemagne, n'est pas même l'objet d'un enseignement facultatif en France; nous la reléguons dédaigneusement parmi les arts d'agrément, comme la danse; quelque désir que j'aie de diminuer l'étendue du programme, j'oserais dire que je le regrette profondément. Il s'agit de faire à toutes ces études une part équitable, en ayant soin de ne pas surcharger les élèves au point de nuire à leur santé, et au développement de leur corps. On se souvient peut-être que, pendant mon administration, j'avais proposé quelques additions et quelques retranchements. On a conservé les additions et renoncé aux retranchements. C'était la pire des solutions. Les élèves, qui étaient autrefois surchargés, sont écrasés maintenant; de sorte, que d'une part, ils se fatiguent outre mesure, et que, de l'autre, à force de vouloir trop apprendre, ils n'apprennent rien." (The italics are our own.)

M. Simon's changes were intended to affect not so much the programme as the method of study. He added a short course of *hygiène*, reorganised the teaching of geography, and increased the number of hours given to modern languages and to French language and literature. To gain time for these alterations M. Simon, as is well known,

recommended the entire abandonment of Latin verse, and a considerable diminution, in general, of written exercises. With such a programme nothing else was possible.

We have grave doubts as to the utility of so extended a scheme. Knowledge has increased enormously, and is still increasing; but the capacity of boys up to twenty years of age remains the same as it ever was. The true solution of this great problem will, we believe, be at last found, not in loading the school course with more and more subjects, but in the organisation of great schools in departments representing the main subjects which, from their inherent importance and the mental training afforded by the study of them, have a just claim to a place in national education. Such subjects are the literary languages ancient and modern, mathematics and the natural sciences. To the method of studying history and literature, great as these subjects are, no more than an introduction can be given at school: the serious and prolonged study of them is a matter for university training. In organising a school course, the first care should be to discipline the mind; the second, to give information. The true aim of education we believe to be, in the immortal words of Plato, "the turning of the mind's eye from false things to true;" or, as M. Simon puts it, "le vrai savant est lui qui s'est rendu amoureux de chercher et capable de juger." Training is, of course, effected partly by imparting information: still, information is a means, not an end. The object of the serious mass of study in a school should be training, and training is best effected, in the case of boys, by concentration. Few boys during the years of their growth can study with profit more than two great subjects. It should be the object of the organisation of a great school to provide a department of science, a department of language ancient and modern, and a department of mathematics. In the department of mathematics all scholars should meet; but no boy should be allowed to belong to the language and the science department as well. Boys in either of these departments would have a few hours every week to spare for subjects outside the stricter courses for lessons of information and diversion. The boys of the scientific department might attend extra lessons in a modern language or in modern history; the boys of the language department a little elementary science. Lessons in geography should be given to all alike. In the language department, again, considerable freedom might be allowed according as the students intend to go into active life or to devote themselves to teaching and technical scholarship. The latter would devote themselves mainly to classics, and for these (*pace* M. Simon) we think Latin verse would, for a time at least, be of considerable service, if not indispensable. The former would write far fewer classical exercises, and devote the extra time thus gained to modern languages.

It may be objected that such a programme would be departmental, almost professional, but not liberal. The constant contact of the boys and masters of the different departments with each other (and we are pleading,

remembered, for departments in the

same school, not for separate schools) would, we believe, do much to counteract the possible dangers of narrowness and exclusiveness of interest. Meanwhile, we think that it is impossible to communicate to boys even the elements of half the subjects which are worth knowing, but that it is possible to strengthen and discipline their minds, and that this can be done only by concentration of the attention, not by loading the memory; by initiating into methods, not by communicating results.

The same difficulties with regard to school education are discussed, though from a different point of view, by Dr. Lothar Meyer, in the pamphlet whose title stands second in the list at the head of this article. The division of the great schools in Germany into *Gymnasien* and *Realschulen* (classical and modern) produces a separation, in the cultivated classes, between the humanists and the realists, each of whom have their own interests and are unjust to the others. The merits and defects of the classical and modern systems are well described on p. 33:—

"An den Gymnasiasten ist zu loben: Gewandtheit und Klarheit des Gedankens und der Sprache, die Befähigung, sich schnell und sicher ein bestimmtes Urtheil zu bilden, und eine darauf begründete Sicherheit des Auftretens. Zu tadeln finden wir dagegen an den meisten Gymnasiasten: eine geringe Befähigung zu mathematischen Denken, Mangel an Uebung in der sinnlichen Wahrnehmung und Auffassung von Dingen und Erscheinungen, in der Verarbeitung der sinnlichen Wahrnehmungen zu bewussten, klaren Vorstellungen und in der Schlussfolgerung aus denselben zur Erkennung des Causalnexus, des Zusammenhanges von Ursache und Wirkung in realen Verhältnissen.

"An den Realschülern ist zu loben: eine bessere mathematische Ausbildung, die aber oft mehr in positiven Kenntnissen als in geistiger Durchbildung besteht, eine grössere Gewöhnung an sinnlichen Wahrnehmungen und ein besseres Verständniss für den Zusammenhang von Ursache und Wirkung in realen Vorgängen und Erscheinungen. Zu tadeln ist dagegen an sehr vielen Realschulen eine geringere Gewandtheit und oft grosse Unklarheit und Unsicherheit in Gedanken und Ausdruck, Mangel an kritischem Sinn und eine oft völlige Unkenntniss der Grenzen und der Tragweite des eigenen Denkens."

Neither education is complete; each system leaves the pupil unable to grapple afterwards with any study involving an unfamiliar method. Dr. Meyer would have the *Gymnasien* turn out their best pupils grounded in the elements of science, mathematics, and languages, and this without the sacrifice of Greek, for which he, although a professor of chemistry, expresses as strong an admiration as the stoutest classicist. He would wish the time and attention now given to the classical languages in the German *Gymnasien* to continue much as at present, but would make the teaching of science and mathematics more effective mainly by an improvement of method.

We have mentioned Dr. Meyer's views on school education in this place for the sake of symmetry; but though interesting, they only incidentally affect the main subject of his pamphlet. Like other high authorities (among them Von Sybel), Dr. Meyer is apprehensive lest the German universities should fall away from the high standard of liberal culture for which they have hitherto

been illustrious. Their great excellence has lain in the constant combination of teaching with research: a combination to the necessity of which it is to be hoped that we in England are at length beginning to open our eyes. The German universities, it is said, are showing a tendency to fall away from their high ideal: a fact attributed by Sybel to the want of time allowed for the academical course; by Dr. Perry of Bonn to want of money, which comes perhaps to the same thing. Dr. Meyer considers the root of the evil to lie deeper. The universities, he says, have done themselves harm by shutting their doors against science, "giving no place to applied mathematics, and only so much to the natural sciences as was absolutely necessary for the study of medicine" (p. 17). Hence a painful division in the national education of Germany. The sciences, excluded from the *Universitas litterarum*, the free atmosphere of liberal culture, have fallen into a technical and practical groove. They have been left without academic tradition, "to the influence of ordinary life and the uneducated public." "The technical schools have been committed to the direction and control of the special departments of State, not to that of the Minister of Instruction:" the result being favourable to the production of well-trained officials, but not to that of educated men.

Nothing could show more conclusively than the proposals of this pamphlet how strong an influence the universities of Germany have exercised upon the general culture of the nation. Dr. Meyer pleads for what we should call an "affiliation" to the universities of the technical institutions: the agricultural schools, schools of mines, the polytechnic schools, and the military academies. Only thus can the special scientific departments be liberalised, and the old ideal of a *Universitas litterarum* restored.

Mr. Matthew Arnold has published a second edition of his report on the higher schools and universities in Germany, with a new preface dealing with the question of the Irish university. The main point of this preface, which is composed with all the spirit and beauty of the author's brilliant and unique political writing, is that it is the duty of the English Government to act towards the Irish Roman Catholics on the same principles as those on which the German statesmen have acted towards the Roman Catholics of Germany: namely, to allow them a Roman Catholic university. We presume that Mr. Arnold means a Roman Catholic faculty in an open university: if not, the parallel with Germany will mislead. In return, the State should, according to Mr. Arnold, retain the power of nominating and removing the Roman Catholic professors; this power to be exercised through a minister acting only for Ireland. This plan, Mr. Arnold thinks, would give the Roman Catholics justice, while it would curb, if not allay, their fanaticism. Prince Bismarck, he says, is at least acting with consistency, if not always with tact, in his present proceedings: the German Government, having allowed the Catholics certain endowments, has a right to exact certain conditions in return. But the policy of the English Government, the outcome of

a combination between Millism and Miallism, rests on no principle, and its only effect on Catholicism is to drive it more into a corner, and make it more bigoted and intractable. "The one way to prevent" the liberalising of Catholicism "is to keep education what is called a hole-and-corner affair, cut off from the public life of the nation and the main current of its thoughts, in the hands of a clique who have been thus narrowly educated themselves. And this is precisely what we are doing by refusing to institute Catholic education publicly." Mr. Arnold's political views are the consistent outcome of his religious theory, that no one Christian sect can claim the sole possession of absolute truth, but that all great forms of Christianity are "approximations" to the truth. "The State is of the religion of all its citizens, without the fanaticism of any of them." If we might understand Mr. Arnold to be pleading, not for a denominational university in Ireland, but for a recognised Catholic faculty in a free university (and any other hypothesis militates with the tone of the preface and the principles professed in it), we should be disposed to accept his proposals as both statesmanlike and philosophical. The chance of their leading to any practical result is another matter.

H. NETTLESHIP.

THE PHYLLOXERA OF THE OAK—DISCOVERIES OF BALBIANI.

THE *Revue Scientifique*, No. xlix., 1874, contains a paper by Professor Balbiani detailing his observations on *Phylloxera quercus*, a species allied to the *P. vastatrix* which has occasioned such ravages among the vines. The vine pest can live underground as well as in the air, and its most destructive work is performed on the roots of the plants to which it obtains access through cracks in the soil. Vines grown on clay lands are most exposed to its assaults, as they become extensively fissured in hot weather, and the best mode yet discovered of checking the mischief is by freely inundating the soil. It is, however, evident that this remedy cannot always be applied, and M. Balbiani studied the life history of *P. quercus*, in the hope it would throw light upon the development and proceedings of its vine relative.

He tells us that somewhat late in spring the first individuals of the Oak Phylloxera may be seen in the shape of pale yellow larvae on the under surface of the leaves, each one occupying the centre of a yellowish spot produced by pricking into the leaf. These larvae grow without changing their position, and after attaining a length of about a millimetre they surround themselves with a number of eggs concentrically arranged. The development of these eggs commences almost as soon as they are laid, and in a few days the young escape and wander to a fresh part of the leaf, in which they plunge their sucking tubes, causing the formation of a yellow spot, which, like their parents, they never leave. Generations thus succeed generations until the entire surfaces of affected leaves are covered with phylloxera of all sizes. When full grown, M. Balbiani figures them as pear-shaped, very broad in the middle, blunt at the head, and very narrow at the posterior segments. The sucking tube of the mouth reaches as low as the third pair of legs, and the creature, exclusive of its antennæ, looks a little more than two inches long when magnified fifty times, as in his sketch. Until about the middle of August in the climate of Paris, only wingless or larval phylloxera are produced, but from then till the end of the month a certain number of the larvae are transformed into winged sorts after passing through the stage of red chrysalids; the

winged form, according to Balbiani's figure, representing a magnification of fifty times, appears under that power five inches across from tip to tip of the larger pair of wings, the body about two inches long, and the sucking mouth tube short, not reaching to the segment carrying the second pair of legs. The lower wings are much smaller than the upper ones, and each one is furnished with a small pair of hooks on the upper edges, about one-third from their tips.

Hitherto no one had succeeded in discovering males of the phylloxera, and in no female organ could any spermatozoa be detected, consequently there could be no doubt that the ordinary generations were parthenogenic. In the females on each side of the oviduct canal are two pouches, connected with glands corresponding with the usual colloid glands of insects, and supplying the substance investing their eggs. Between these is a pouch like that for receiving spermatozoa, though none have been found in any case.

The question to be decided was whether, and if so when, the phylloxera, like the aphids, produced males and the females laid fecundated eggs.

On examining the individuals destined to be transformed into winged insects, no external character differentiated them from the wingless generations; but an examination of internal organs showed their reproductive apparatus to be slightly developed. Thus, while the egg-laying larvae contained a variable number of eggs more or less matured, these individuals only contained eggs so slightly developed as to be little distinguished from the other contents of the ovary.

It was observed that the winged insects did not remain on the leaves longer than was necessary for the hardening of their integuments, and very seldom laid eggs upon them. In calm weather they remained longer than when it was windy, confirming the remarks made by naturalists concerning other insects, and notably by Morren with regard to aphides, that they availed themselves of air currents to help their flight. But when did they go, and where deposit their eggs? In September M. Balbiani placed some twenty winged females in a bottle with a fresh oak leaf, in which they thrust their sucking tubes without delay. The next day, however, some were uneasy and moved about, depositing here and there an egg. Others, after wandering about, returned to their first place, and laid their eggs in a heap, and others, again, left the leaf altogether, and laid an egg here and there on the sides of the bottle. In two days all had finished laying, and soon after they died.

The eggs were alike in shape, but some were twice as big as others. When the hatching came the small eggs produced small red larvae, and the big ones larger yellow ones—the small being the males, and the larger ones the true females of the species.

M. Balbiani subsequently found that the winged sorts laid their eggs among the old scales at the base of the new shoots of the trees, and that they were hatched in about twelve days; and now comes the most curious part of his discoveries: both males and females from their eggs were destitute of alimentary and digestive organs, as male rotifers have long been known to be. They have no suctorial mouths, no stomachs, &c., but their reproductive apparatus is highly developed, and they spend their short lives in the formation of fecundated eggs. The ovary of these females is much simpler than in the parthenogenetic forms; instead of two ovaries, each with from two to six ovigerous tubes, there is a single tube in the middle of the body. These females lay only one egg, in fissures and cracks of the oak bark: it is a "winter egg," neither like the egg of the parthenogenetic females, or those of the winged insects. April is the time for hatching these winter eggs. The first generation thus produced is extremely fertile, one of them being seen on April 25 with 87 eggs, which in two or three days were increased to more than 100. In the summer these

females are less prolific, the ovarian tubes diminishing in number until at last only one is found. Thus the vital energies of the parthenogenetic females become exhausted, and the reappearance of the males is requisite for the continuance of the race.

NOTES AND NEWS.

M. D'ABBADIE gave an interesting account, at the late meeting of the Astronomical Society, of the French preparations for observing the transit of Venus. Though the sum of 4,000*l.* only is voted for this expedition, much will be done to obtain results worthy of the position to which France aspires in the scientific world. Much interest attaches to the photographic part of the preparations, for the French alone propose to use daguerreotypes, and though the delicacy of the results is undoubted, the difficulty of manipulation is so great that other governments have preferred the more modern collodion process.

It is in some sense an advantage that different nations propose to use different processes, though the results are thereby rendered less strictly comparable. Thus America and Germany will use telescopes of long focus giving a large image of the sun; England and Russia, on the other hand, will rely on a secondary magnifier with a short telescope to give a picture of proper size, whilst France will have a telescope of moderate focal length, trusting to being able to magnify afterwards the rather small image on the daguerreotype. It is rather curious that the plan proposed by M. Janssen for obtaining a number of photographs at intervals of a second is not adopted by the French, though it has been applied to all the English photoheliographs.

AFTER an adventurous journey into the interior from Cape Town, Mr. Stone has been fortunate enough to obtain an uninterrupted view for nearly four minutes of the solar eclipse of April 16, and though the instrumental means at his disposal were not all that could be desired, the results obtained are important, and worthy of such an energetic observer. Of course the spectroscope was the chief instrument of the attack, which was directed entirely against that wonderful appendage of the sun, the corona.

The observations made in India during the eclipse of 1871 are fully confirmed by Mr. Stone, and it appears that the corona is composed of incandescent gas, shining partly by its own glow, and partly by reflected sunlight, for Mr. Stone found its spectrum to consist of one bright line, and several others not so conspicuous, and only seen near the sun's limb, together with a faint solar spectrum crossed by the Fraunhofer dark lines, and due to reflected sunlight.

Another important observation was, that just after the sun's light had been blotted out by the advancing moon, and before the latter had covered the portion just beyond the sun's limb, lines of the spectrum usually seen dark against the bright background of the spectrum flashed out bright as the latter faded away. This phenomenon was observed in the eclipse of 1870 by Professor Young, by more than one observer in 1871, and again, in 1872, by Mr. Pogson, and is important as showing the existence of a stratum of incandescent vapours of different metals close to the sun's surface, which gives rise to the absorption bands known as Fraunhofer's lines, and from which the explosions of hydrogen and the lighter vapours, which form the red prominences, have their origin.

A drawing of the corona was made by a lady several hundred miles away from Mr. Stone's station, and this agrees remarkably with the appearance seen by Mr. Stone and his wife, thus negating the hypothesis of a terrestrial origin for the phenomenon.

MR. BIDDER, Q.C., has devised an ingenious micrometer for measuring faint stars, the principle being that instead of the spider lines themself

an image or "ghost" of them is thrown into the field of view by means of a reflecting prism. The advantage gained by this arrangement is that the artificial light required to render the webs visible is kept out of the field of view, and therefore cannot interfere with the visibility of a very faint object.

A DISCUSSION on the "black drop" seen in transits of Venus or Mercury took place at the last meeting of the Astronomical Society, but though much time was occupied by the remarks of numerous speakers, it cannot be said that much was added to our knowledge of this phenomenon.

THE comet discovered by M. Coggia, on April 17, is still puzzling astronomers as to its future path, one orbit after another being rejected, as fresh observations are made. According to a recent set of elements, the comet will approach nearest to the sun on July 20, and to the earth on August 3, at which latter date it will be nearly fifty times as bright as it is now, or equal to a star of the second magnitude. But Mr. Hind, quite lately, computes that its nearest approach to the sun will occur on July 8; and though all corrections have been taken account of in forming his orbit, it is clear that, from the peculiar position of the comet's path, further observations are required to determine the elements with any approach to certainty. Mr. Hind states that the comet, which is now as bright as a star of the sixth magnitude (or just visible to the naked eye), has a tail two degrees in length. It is now in the constellation Camelopardus, about 20° immediately below the pole at 1 A.M., and therefore to be seen in the north-east after sunset, nearly midway between Ursa Major and Perseus.

M. FLAMMARION has computed a new orbit for that remarkable double star η Coronae, in which the observations for forty-seven years, ending with 1873, have been used. It is rather strange, considering the long period during which this star has been watched (for Sir W. Herschel first observed it in 1781), that there should be so much doubt as to its period. M. Flammarion now makes it forty years, or three years less than that usually assigned, so that it has actually completed two revolutions since the first date of observation.

DR. GALLE, of Breslau, has discussed at some length, in the *Astronomische Nachrichten*, all the available observations of the meteor of June 17, 1873, which passed over the north of Hungary, Austria, and Bohemia. It appears that it was first seen at a height of 100 miles above the earth, and that it disappeared when about twenty-one miles high, after having described a path of 290 miles in about ten seconds, giving a velocity in space of about twenty-eight miles in a second. This velocity is too great for a parabolic orbit, and it would seem, therefore, though there is some uncertainty about the observations of duration, that the meteor, at the time it was seen, was describing an hyperbola. But it is to be remarked that it was then under the influence of the earth's attraction, and it would be necessary to calculate the effect of this, which Dr. Galle does not appear to have done, before drawing any conclusions as to the orbit described previous to the rencontre. It may very possibly have been peaceably circulating round the sun in an elongated ellipse, as other meteors are in the habit of doing, until it fell in with our planet.

A SOIRÉE was given last Wednesday evening by the President of the Geological Society, in the new apartments at Burlington House, to which the Society has lately been removed. Among the many objects of scientific interest exhibited on this occasion may be specially noted a choice selection of antiquities from the President's rich private collections, and a complete series of specimens from the Sub-Wealden Exploration, exhibited by Mr. H. Willett. This collection comprised examples of the six-inch cores of gypsum, obtained under the old system of boring, and

numerous examples of the smaller cores drilled out by the diamond-mounted borer now in use. Some of the actual boring apparatus was exhibited, together with photographs of the machinery. The collection of cores contained a fine series of Kimeridge-clay fossils, including a newly-discovered and undescribed species of *Arca*.

With reference to this boring, we may remark that the accident to which we recently referred has been overcome; the rods which had fallen have been duly raised, and the work has been resumed with success. On reaching the depth of 1,000 feet, which had been contracted for, the experiment would have been abruptly terminated, or at least interrupted, had not Mr. Willett generously undertaken the personal responsibility of boring for another 200 feet. It is to be hoped, however, that funds will be subscribed sufficient to prosecute this unique experiment to a much greater depth. At any rate, we are now certain of going down to 1,200 feet, and it is probable that the thick deposit of clay will be penetrated before that depth is attained. Some geologists have maintained that this clay may represent both the Kimeridge and the Oxford clay, the shallow-water deposits of the Coral Rag being absent. It is only fair, however, to observe that other geologists refer the whole of the deposit to the Kimeridge clay alone. Whatever may be the nature of the strata now being pierced, it is much to be desired that this bold experiment may be continued until Palaeozoic rocks shall have been struck.

MR. E. TYLOR, to whom we owe so interesting a chapter on the *Couvade*, has called attention to several new cases of this extraordinary custom in his review of Dr. Peschel's *Völkerkunde* (ACADEMY, June 13). The following letter from Mr. John Cain, in the *Indian Antiquary* for May, 1874, may be of interest to him and to other readers:—

"In the districts in South India in which Telugu is spoken, there is a wandering tribe of people called the Erukavandlu. They generally pitch their huts, for the time being, just outside a town or village. Their chief occupations are fortune-telling, rearing pigs, and making mats. Those in this part of the Telugu country observe the custom mentioned in Max Müller's *Chips from a German Workshop*, vol. ii., pp. 277-284. Directly the woman feels the birth-pangs, she informs her husband, who immediately takes some of her clothes, puts them on, places on his forehead the mark which the women usually place on theirs, retires into a dark room where there is only a very dim lamp, and lies down on the bed, covering himself up with a long cloth. When the child is born, it is washed and placed on the cot beside the father. Assafoetida, jaggery, and other articles are then given, not to the mother but to the father. During the days of ceremonial uncleanness the man is treated as the other Hindus treat their women on such occasions. He is not allowed to leave his bed, but has everything needful brought to him.

"The Erukavandlu marry when quite young. At the birth of a daughter the father of an unmarried little boy often brings a rupee and ties it in the cloth of the father of the newly-born girl. When the girl is grown up he can claim her for his son. For twenty-five rupees he can claim her much earlier."

THE following German scholars have promised to be present at the International Oriental Congress in London:—From Alsace and Lorraine: Professors Nöldeke, Euting, and Goldschmidt. From Prussia: Professors Lepsius, Dillmann, Stenzler, Gosche, Weber, and Stern. From Bavaria: Professors Spiegel and Haug. From Saxony: Professors Brockhaus, Ebers, Krehl, and Kuhn, jun. From Württemberg: Professors Roth and Trumpp. From Baden: Professors Weil, Windisch and Eisenlohr. From Hesse: Professor Merx. From Saxe-Weimar: Professor Schrader. From Saxe-Coburg: Professor Pertsch. Several of the German governments have undertaken to provide the travelling expenses.

THE *Times of India* hears that Mr. A. L. Piddington, after considerable trouble, has been

able to collect all the writings of his late father, Dr. Henry Piddington, which originally appeared either as separate publications, or in the pages of the Asiatic Society's *Journal* and other scientific periodicals, and proposes to publish them all together. The work will be called *Memoir of the Scientific and other Works of the late Henry Piddington*, and will include a short biography from the pen of his son, compiled chiefly from materials in the possession of the family.

THE "premier fascicule" of a series of *Documents pour servir à l'étude historique de la langue Basque*, par M. Julien Vinson, has just been published by Cazals, Bayonne. This first fascicule contains the Gospel of St. Mark, by Leizarraga of Briscous. It forms part of the complete translation of the New Testament into Basque, published at La Rochelle, 1571, under the auspices of Jeanne d'Albret. Only some twelve copies of the original work are known to exist. The present text has been taken mainly from a MS. copy of the Gospel which was lately discovered in the Pays Basque. To it are prefixed the dedications, in French and Basque, to Jeanne d'Albret by Leizarraga. A valuable introduction, giving the whole facts known about Leizarraga and some critical remarks, is added by the able editor.

The value of Leizarraga's version is well-known. Only one other printed book, the *Poésies Basques* of Dechepare, 1545 (also lately reprinted by Cazals, Bayonne), preceded it; but Leizarraga is by far the most important. In this and in other early Basque writings, we see that several verbal forms which are now confined to some one dialect, were in the sixteenth century common to others.

The second fascicule of these *Documents*, now in the press, will contain specimens of Basque authors of the sixteenth and seventeenth centuries, and also a vocabulary, with explanations, of all the verbal forms contained in the present number. It is to be hoped that due support will be given to this endeavour to place the means of an historic study of Euscara within the reach of students. Both editor and printer will do their parts with zeal.

MEETINGS OF SOCIETIES.

COLLEGE OF PRECEPTORS (Wednesday, June 10).

REV. G. C. BELL, Head-master of Christ's Hospital, Vice-president, in the Chair.—Mr. Alexander J. Ellis, F.R.S., read a paper called "Practical Hints on the Quantitative Pronunciation of Latin," in which he gave the following rules for pronunciation of open vowels, and the final M in Latin. When a word ends with a vowel, and the next word begins with a vowel, the two vowels are both heard, but are counted only as one syllable, precisely as in modern Italian as pronounced by any native singer. This practice Mr. Ellis calls *slurring*. If the first vowel is short, the length of the mixed syllable is reckoned to be the same as that of the second. If the first vowel is long, the same rule may hold, or the syllable may be long. If both vowels are long, the syllable is long. There are, however, occasional exceptions, in which no slurring occurs, but Cicero says that poets only used them to get a word into verse, and declares that the Roman ear could not endure much of them (*Orator*, § 152).

As to final M.—1. It has never the sound of English *m*, unless another *m* follows; (2) when followed by a vowel, it is entirely omitted, and the vowel is slurred as before; (3) when followed by a word which succeeds it without a pause, the sound of *m* is omitted, but the following consonant is treated like a double letter in Italian, and hence "makes position;" the result is, however, shown to be two words, and not one word, by the presence of an accent for each word; before the enclitic *que*, it is *c*, and its syllable has the accent, thus *puerumque* becomes *puerūque*; (4) when before a pause, the *m* is also omitted, and the vowel is either lengthened to show the

omission of the letter, or treated indifferently, as are all final syllables (Cic. Or. § 217).

The rule for showing the mode in which final M makes position was deduced by Mr. Ellis from the practice of Italian in showing an omitted t, d, l or n final. Thus *cid che* becomes *ciocche*, *a dio* becomes *addio*, *and ri* becomes *amovi*, *il dio* becomes *iddio*, *con lo* becomes *collo* or *col*, even in writing. And in correct speech *e lui*, *a lui*, &c., become *ellui* *allui*, &c. Using a hyphen between vowels for a slur, and between a vowel and consonant for this assimilative strengthening, we may write the third line of Tasso's *Gerusalemme* thus,

molto-egli-oprò-col senno-e-con la mano,
in which there occur three slurs and two assimilations, shown by hyphens, and one assimilation, *col*, by writing.

The accent Mr. Ellis considered to have been shown solely by raising the musical pitch of the voice, without necessarily increasing its force, or the length of a vowel or syllable, appealing to Cicero's *Orator*, §§ 57-59, 173, 183, and *De Or.*, § 228.

Mr. Ellis read out numerous classical passages in various metres, and from Cicero, showing how these rules could be applied so as to fulfil all the conditions of rhythm in Latin verse and prose, adopting for the most part, in other respects, the scheme of Latin pronunciation furnished by Professors Palmer and Munro.

NEW SHAKSPEARE SOCIETY (Friday, June 12).

A PAPER was read by Mr. Fleay on certain plays of Shakspeare which he holds to have been written piecemeal, at different periods of Shakspeare's life. As to the principal one of these plays, *Troilus and Cressida*, he has extended the view which he first published in this paper; and now assigns the play to three dates of composition instead of two. The story of *Troilus*, with everything relating to the love-making in the play—in other words, the tale as told by Chaucer—he assigns to the same date as *Romeo and Juliet*, and regards it as meant to immediately follow that drama. The second story, of Hector, with the combat with Ajax, he assigns to 1595, two years after the first story, and looks to Caxton's *Three Destructions of Troy* and Lydgate as the authorities from which it was derived. The third story, of Achilles, his anger with the Greeks, &c., he assigns to 1606-7, the character of Thersites being taken from Chapman's translation of the *Iliad*. He supported this hypothesis by the double termination found in the play as it stands, by parallel passages from other plays, by showing how easily the play could be divided into three, and by the proportions given by the rhyme-test, which exactly agreed with the dates assigned.

The plays next in importance treated of were *Twelfth Night* and *The Two Gentlemen of Verona*. Following Karl Simrock, Mr. Fleay showed that these plays were derived from the same sources so far as the love stories are concerned, but that the latter part of *The Two Gentlemen* differs from the original novel. He assigned the first two acts of this play and the story of Viola in the other to 1593 and 1594; adding that the story of Malvolio, &c., was introduced, and *Twelfth Night* completed, in 1602. The three last acts of *The Two Gentlemen* he assigned to a second author. His arguments were the perfect separation of the two plots which can be easily made in *Twelfth Night*, the improbability of plots from the same sources being used at distant periods by Shakspeare, and the distinct indications of the rhyme-test and other metrical peculiarities in this play. For the other play he pointed out the discrepancies in the early and late parts as to the towns Verona and Milan, the courts of the Duke and the Emperor, &c.; the plagiarisms in the latter part from *Romeo and Juliet* and other plays; the great correspondence of the metre of the early part with that of *Richard III.* and *The Merchant of Venice*, with many other minute, but distinct,

indications of similarity to other plays of about the date assigned: he also showed that the rhyme-test gave exactly the same results as to date as the other arguments did, and that the differences between the two parts of the play, shown by the same test, were far too great to allow of single authorship at one epoch.

Of *All's Well that Ends Well* Mr. Fleay gave a slight notice (probably feeling that the paper was too long): merely pointing out that it was written at two distinct times, the early part being possibly from *Love's Labour's Won*. There was little new in his treatment of this play except the usual application of the rhyme-test.

He showed also that the additions to *Richard II.* displayed exactly such changes in rhythm as his theory required.

But the important, far the most important, part of the paper was that independent of the title. Mr. Fleay ventured on a hypothesis connecting the acknowledged changes in Shakspeare's style at the end of his first, second, and third periods with the greater sorrows of his life: (1) the death of Marlowe; (2) the death of his father; (3) the death of his brother Edmund, who had followed him from Stratford and become a player. He showed that on his theory each of these calamities was followed by a period of unsettled agitation, in which the poet's work was fragmentary, and that after each such period a change of style and rhythm took place in his work which, in every instance, tended in the same direction: from fair fiction to hard truth, from poetry to prose, from fancy to experience. To these sorrows he traced the dramatist's tragic power. "Without them," he said, "we might have had no Cordelia."

Mr. Fleay finished by laying down a number of canons for the use of metrical tests which are too technical for our pages: it is noteworthy, however, that, whether designedly or not, they contain all the answer he has hitherto thought proper to give to the numerous objections that have been brought against his theories in the discussions.

PHYSICAL SOCIETY (Saturday, June 13).

PROFESSOR HERBERT MCLEOD described an apparatus for the measurement of the pressure exerted by highly rarefied gases. The method employed consisted essentially in compressing a measured volume of the gas to a comparatively small known fraction of its original bulk, and measuring the pressure exerted by it in this state.—Mr. W. Spottiswoode, F.R.S., exhibited experiments on the composition of colours by polarized light. A beam of polarized light was passed through a plate of quartz and a doubly-refracting rhomb of Iceland spar, and the two resulting complementary beams were then sent through a second plate of quartz and a second doubly-refracting rhomb, whereby four coloured beams were produced; in some experiments these were passed through a third quartz-plate and doubly-refracting rhomb. The colours thus obtained were exhibited by receiving the luminous beams on a screen, and their constitution was shown by the formation of their prismatic spectra. The essential results of the experiments have been described already in papers communicated to the Proceedings of the Royal Society and to the Journal of the Royal Institution. Dr. Stone exhibited a simple method of converting an ordinary polarising microscope into an instrument with which the coloured rings of doubly-refracting crystals can be examined. He showed that all that was needful was to insert an additional object-glass of low power (focal length about three inches) into the body of the microscope by means of a screw at the end of the draw-tube.

ROYAL GEOGRAPHICAL SOCIETY (Monday, June 15).

At the meeting of the Society a paper was read by Eugene Schuyler, of the American Legation at St. Petersburg, on the Khanate of Kokan, where he had resided for a month, and extracts from

correspondence respecting the progress of the Forsyth Mission in Kashgaria and the Pamir.

Sir Henry Rawlinson, who occupied the chair in the absence of Sir Bartle Frere, who had gone to Cambridge to receive an honorary degree, stated with reference to the claims of the Livingstone family on the country, that the Government had, after due consideration, resolved to apportion a capital sum of 3,000*l.*, instead of the 10,000*l.* or 11,000*l.* mentioned by the deputation which had an interview with Mr. Disraeli. The Government had, in addition, undertaken, in a most proper and liberal spirit, to pay a sum of nearly 1,000*l.*, due for arrears of wages to Livingstone's followers, for which the Acting Consul at Zanzibar had drawn on the Society, who, however, had represented to the Treasury that they could not hold themselves responsible for the expenses of the late Doctor's servants, great as their interest in his proceedings was.

Mr. Schuyler, who had been travelling in Kokan between March and November last year, stated that he had made Tashkend and Samarkand his headquarters, but he had also visited Bokhara, Sher-i-sebs, and Kokan, returning home by way of Lake Issyk-kul and Kuldja. He, and a Russian officer who had come in quest of timber for building a bridge over the Syr Daria with, left Khojend on June 13, and visited Uch-Kurgan, Andijan, and Ush to the extreme eastward. In consequence of a rebellion which had broken out among the Khirgiz, he was prevented from going on towards Kashgar, and from exploring the Karategin mountains, and when, after almost endless trouble, he was allowed to make some excursions in the neighbourhood, he was misled by his guides and thus forced to return to Kokan. The Khan of Kokan and his subjects were most suspicious of Russians (among whom they classed Mr. Schuyler), and would not permit him and the Russian merchants to leave the Serai after 7 p.m. The valley of Kokan is almond-shaped, about 160 miles in length, by 65 in extreme width; it is surrounded by mountain ranges, which narrow to small hills near Uzgent, where is the only practicable road into the Khanate. The most fertile part of the country was in the neighbourhood of Andijan, and the territory between the Syr-Daria and Naryn rivers. After the two joined, the Syr-Daria, as it is there called, flows between high banks, its tributaries alone being available for irrigation. The climate of the Khanate is milder than in Russian Turkestan, as little snow falls in winter, and the summer days, though extremely hot, are followed by cool nights. The mountains abounded in minerals: coal, iron, naphtha, and petroleum having been found. Cotton and silk are the chief exports: about 8,000,000 lb. of the first, and 200,000 lb. of the second having been exported to Russia in 1872. The population consisted mainly of settled inhabitants and nomads—Usbegs and Kipchaks or Khirghiz—between whom there are constant feuds; towards the west were found Tajiks, who are of Persian origin, and scattered all over the Khanate are to be found Hebrews, Hindus, and occasionally Afghans.

In the correspondence subsequently read by Sir Henry Rawlinson, mention was made of the important fact that the triangulation of India, continued by the efforts of the scientific officers of the mission in their journey northward, had actually overlapped the Russian series, and that now there exists a chain of triangles from Archangel to Cape Comorin.

The meeting concluded with an announcement of the annual meeting and dinner, which takes place next Monday.

LONDON ANTHROPOLOGICAL SOCIETY.

(Tuesday, June 16).

THIS society held its last meeting for the season; the next session will commence in November, and last till June 1875. H. B. Churchill, Esq., V.P., presided, and a paper by Mr. C. F. Amery was read, on "Reason and Instinct." After giving many in-

stances, the author concluded thus: "The want of readiness in adoption of means and utter incapacity of adaptation constitute the principal perceptible points of distinction between the mental powers of the elephant and of the Australian aborigine. That the latter has a far wider range of ideas is indisputable, but this is a question of degree only, and not of kind. The mental scope of the highest human minds is wider in excess of the Australian aborigine's than the latter is in excess of the elephant."

LINNEAN SOCIETY.

(Anniversary Meeting, Monday, May 25).

G. BUSK, Esq., Vice-President, in the Chair. The following gentlemen were elected officers of the Society for the coming year, viz.: President, G. J. Allman, M.D.; Treasurer, Daniel Hanbury, Esq.; Secretaries, Frederick Currey, Esq., and St. George J. Mivart, Esq. Robert Braithwaite, M.D.; J. D. Hooker, C.B., M.D.; J. G. Jeffreys, LL.D.; Daniel Oliver, Esq.; and W. W. Saunders, Esq., were removed from the Council, and the following five gentlemen elected in their place, viz.: Major-General Strachey; W. T. T. Dyer, Esq.; J. E. Harting, Esq.; W. P. Hiern, Esq.; J. J. Weir, Esq.

(June 4, 1874.)

G. J. ALLMAN, M.D., President, in the Chair. Professor Thiselton Dyer described the structure of the flowers of *Pringlea* and *Lyallia*, which had recently been sent to this country for the first time by Mr. Moseley, from Kerguelen's Land, and which had been analysed by Professor Oliver, and subsequently by himself.

Dr. Hooker pointed out that several peculiarities in the structure of *Pringlea*, the absence of petals and of the usual glands between the bases of the stamens, the exerted anthers, and the papillae of the stigma extended into a tuft of hairs, appeared to point to this plant (a native of a country where there are no winged insects) being a wind-fertilised member of a class of plants that are ordinarily fertilised by insects.

The following papers were then read, viz.:—

1. "Contributions to the Botany of the Challenger Expedition." Presented by Dr. J. D. Hooker, C.B. No. XIIa. "Challenger Lichens" (Cape de Verdes). By Dr. J. Stirton. No. XVIIa. "Letter from Mr. H. N. Moseley to Dr. Hooker, dated Cape Otway, Australia, March 16, 1874. On the Botany of Kerguelen's Land, Marion, and Heard Islands." No. XVIII. "List of hitherto unrecorded Species from Kerguelen's Land, Marion, and Heard Islands, with a Note on *Lyallia Kerguelensis*, Hook. f." By Professor Oliver. "Synopsis of the Mosses of the Island of St. Paul." By W. Mitten, A.L.S. (Appendix to Dr. Hooker's paper "On St. Paul's Island Plants.") 2. "On the Restiaceae of Thunberg's Herbarium." By M. T. Masters, M.D., F.R.S. At the time that the author published his monograph "On the South-African Restiaceae" in the Journal of the Society, vol. viii. p. 211, and vol. x. p. 209, he had had no opportunity of examining the type specimens described by Thunberg. The few figures published by that naturalist are excellent; but his descriptions are often so imperfect that not even the sex of the plant is mentioned. In common, therefore, with all who had previously studied these plants, the author had to guess at the species intended by Thunberg. Lately, however, by the kindness of the authorities at Upsal, Thunberg's African collections have been transmitted to Kew for examination, and the author availed himself of the opportunity to study the Restiaceae. The paper now read contains a list of these specimens, with their names, synonyms, and such rectifications in the nomenclature as the examination rendered necessary. 3. "On *Napoleona*, *Omphalocarpum*, and *Asteranthos*." By J. Miers, V.P.L.S. The plants, forming the small group of the *Napoleoneae*, are confined to two very heterogeneous

genera, one from Africa, the other from Brazil. *Napoleona* was discovered in 1787 at Owaree, by Palisot-Beauvois; *Asteranthos* was established in 1820 by Desfontaines, when he associated it with *Napoleona* as a group belonging to *Symplocineae*. These plants have been ever since a complete puzzle to botanists, who have assigned to them remotely dissimilar positions, the last being that given by the authors of the *Genera Plantarum*, who make them a sub-tribe of *Lecythis*, one of their tribes of *Myrtaceae*. A careful examination of these plants has convinced the author that most botanists have been wide of the mark in regard to their true affinity.

Mr. Miers brought forward a large mass of information concerning *Napoleona*, from which he inferred that there is nothing in its structure to show the slightest relation to *Myrtaceae*; that it is equally irreconcilable with the *Barringtonieae* and with *Lecythis*; and in consequence of these negative results we must search elsewhere for its true affinity. This led the author to examine *Omphalocarpum*, a genus from the same region as *Napoleona*, and whose flowers and fruit of similar form grow upon the trunk of the trees. This genus has been generally regarded as belonging to *Sapotaceae*, with which view the author agrees; but the authors of the *Genera Plantarum* place it in *Ternstroemiaceae*. On comparing this structure with that of *Napoleona*, many unexpected points of analogy present themselves. *Napoleona* cannot, it is true, belong to *Sapotaceae*; but as it offers so many points of resemblance, and as it cannot find a place in any known natural order, it must remain the monotype of a distinct family, to be placed in juxtaposition with *Sapotaceae*.

In regard to *Asteranthos*, the author shows by analytical figures that it bears scarcely any resemblance in any of its features to *Napoleona*. A strong resemblance exists in the form of its calyx to that represented by Wight in an Indian species of *Rhododendron*. And there seems nothing, therefore, to separate *Asteranthos* from other genera of *Rhododendreae*, except its more rotate corolla.

FINE ART.

LOAN EXHIBITION OF ENAMELS AT THE SOUTH KENSINGTON MUSEUM.

AN interesting loan collection of enamels is now on view at the South Kensington Museum, exhibiting a full illustration of the art in all countries and all ages. Beginning with the earlier division of encrusted enamels, the cloisonné, we find this class well represented by the Byzantine pectoral cross of Mr. Beresford Hope, derived from the Debruge collection. This remarkable piece consists of two plates of gold, enamelled on both sides by the cloisonné process, forming a little box or reliquary. It may be referred to the tenth or eleventh century.

Of the champlevé enamels, so profusely applied from the eleventh to the fourteenth century to the decoration of utensils both ecclesiastical and domestic, there are many fine examples of the work of both the Limoges and Rhenish schools. Mr. Hope sends a Limoges reliquary of the twelfth century, a chalice of St. Thomas of Canterbury, a quadrangular temple of enamelled brass with ivory plaques of saints, an oval vesica-shaped plaque of the Saviour seated in majesty, the last German work of the thirteenth century. From the South Kensington Museum is a shrine representing a square temple, surmounted by a dome, surrounded by ivory figures of the apostles, and decorated throughout with carved ivories and champlevé enamels—the work of Rhenish Bavarian artists of the twelfth century. Also a portable altar, with fine enamelled crucifix, and half-figures of the apostles on the sides—German, about 1300. A singular bronze chalice, gilt, of the twelfth century, inlaid with champlevé enamels in quatrefoil outline at the corners—also from the Museum.

It appears never to have been used before it was buried with the priest to whom it belonged. We must mention two ciboria, but will stop no longer to enumerate the pyxes, candlesticks, shrines, pastoral staffs, &c., which are comprised in this class. Lord Balfour exhibits a spherical ciborium of copper gilt, ornamented with subjects in brilliant colours in medallions formed by graceful scroll-work. The six subjects on the cover are from the Life and Passion of our Saviour; the six on the back, antitypes of the same derived from the Old Testament. This ciborium is traditionally regarded as having belonged to Malcolm Canmore, King of Scotland, and is believed to have been given by Queen Mary to her faithful adherent Sir James Balfour of Burleigh. The other ciborium, of similar form and workmanship, belongs to the Rev. G. W. Braikenridge. Both are German work of the twelfth century.

In the fifteenth century a new school was formed at Limoges: metal no longer formed a part of the composition, but was merely used, like wood or canvas, as an excipient for the enamelled painting. In the early stage of the art, leaves of gold, "pailons," were fixed upon the ground to heighten the effect of the enamel; of this process examples may be seen in the collection, but it fell into disuse when the fine school of art was inaugurated by Léonard Limousin, the Pénicauds, and Pierre Raymond. The arrival of Italian artists at the court of Francis I., and the publication of the engravings of Raffaele, gave a new direction to Limoges enamellers, who adopted the style of the Renaissance, no longer confining themselves to small pictures, cups, ewers, vases, dishes, salt-cellar—every object in vulgar metal was clothed in rich enamel, as striking by its elegance of design as by its richness of colour. Léonard pushed to perfection grisaille painting, the most artistic vehicle for designs in the prevailing Italian taste. The rich collections of the Earl of Warwick, the Duke of Marlborough, and others, furnish abundant examples of this style. The flesh is lightly tinted, and heightenings of gold introduced. Of Pénicaud II. are the *Gathering of Manna*, and the eighteen plaques, scenes in the life of our Saviour, dated 1531, both from the South Kensington Museum. Léonard Limousin painted *The Feast of the Gods*, *Cupid and Psyche*; the remarkable hunting horn of Mr. H. Magniac, from the Strawberry Hill collection, formed of a cow's horn encased with silver, one side enamelled in colours, representing the conversion of St. Hubert; the other, worn against the side, with David slaying Goliath, in grisaille. Large portraits of Cardinal Guise, and his sister Anne of Este, part of a series executed for Henry II. (not Henry III., as stated, for Léonard died the year of his accession); Charity, a plaque, and many others.

There is a fine dish by Jean Courtois, profusely decorated with ornaments and arabesques, *The Israelites gathering Manna*; and of his pupil Suzanne Court, with whom he is often confounded, *Wells dug by Isaac in the Valley of Gerar*, the back beautifully painted with masks, terminal figures, and pots of flowers; a tazza—subject, *Abraham and Melchizedek*; and others, all brilliant in colouring, but in her usual *manière* and monotonous style—all the faces alike. Sir R. Wallace gives a fine example of Martial Courtois, *Apollo in Parnassus*, with the Muses, Pegasus, and other attributes; the colouring most brilliant. A casket, by Jean Limousin, is *semé* with S's, and a stroke (*trait*) across each, probably a rebus of Estreés. It was in the Debruge collection, when it was stated to have belonged to Anne of Austria. The works of Laudin and Noulher mark the decline of the art.

The show of English enamels of Battersea and Bilston is very poor as compared with many private collections. Two sets of firedogs, above two feet high, of brass cast in relief, the royal arms in coarse green and white enamel, are sent by Lord Cowley.

Various enamelled portraits by Bone, Essex, and

others; snuff-boxes, watches—one formerly the property of Mary Stuart. Some pretty French enamel pendants by Froment Meurice, and other modern artists; and a series of portraits by Petitot. Mr. Hope's sardonyx ewer, in gold, enamels, and precious stones, evidently Italian work, formed part of the crown jewels before the Revolution.

Of Venetian enamels there are some very good examples, Oriental in their character. Among others a radiating gadrooned dish, gros bleu and white enriched with gold.

Russo-Greek diptychs and triptychs, cast or of coarse champlevé enamel, and an ostrich egg with enamel setting, Russian or Oriental.

Brooch and head ornaments from Algeria.

Persians boxes, "zafts" or stands for cups, and a gun, all covered with roses and iris, and swords enriched with enamels encrusted in gold.

The Chinese cloisonné enamels are familiar to all—vases, incense burners, candlesticks, every object of domestic use—of turquoise ground, with flower and scroll ornament. There is a circular lobed box and cover of copper, gilt, with dark blue enamel ground, from the Summer Palace at Pekin; and a staff, a white cylinder, with a Runic calendar engraved in black characters, of Chinese cloisonné enamel.

A case is filled with the contributions of Mr. James L. Bowes, whose superb collection of Japanese enamels was exhibited at Liverpool, and has been described in the analytical catalogue of Mr. Audsley. The Japanese work is entirely *cloisonné*, and differs from the Chinese and European enamelling of the same class, inasmuch as in these the *cloisons*, or cells in which the enamel is placed, are comparatively large to the specimens of old Japanese, in which the partitions are of the most elaborate fineness and delicacy. The minutest leaves have their edges delicately serrated, and the patterns are floral, or composed of minute scroll-work, small flowers, rosettes, chequers and other geometrical devices, the beauty of the design being again subordinate to the charming colouring combining richness and sobriety. These old enamels have only lately found their way out of Japan, and it is supposed they were made solely for the grandees of the land, but recent political changes have caused the houses in which they were treasured up to be plundered, and their contents sent abroad for sale. The vases bearing the insignia of the Mikado and other armorial bearings warrant the supposition. One striking difference between the ancient and modern enamel is in the weight. Ancient pieces are enamelled on both sides, and are some not above a sixteenth of an inch in thickness, and of corresponding lightness; whereas the modern betray themselves by their weight alone.

When the official catalogue, preparing by Mr. J. Hungerford Pollen, is published, more may be said upon this interesting collection, but in the present absence of instructive descriptions it is difficult to attempt any correct inventory of its contents.

F. BURY PALLISER.

EXHIBITION OF THE WORKS OF PRUD'HON.

Paris: June 16, 1874.

M. EUDOXE MARCILLE is an amateur whose house in the Rue d'Hauteville is generously thrown open every Monday to critics and people at large who wish to study fine specimens of Prud'hon, Chardin, the pastellist La Tour, and others. His brother Camille Marcille lives at Chartres, and has a similar collection. Their father was an amateur who was perhaps the first in France to show an almost idolatrous veneration for Prud'hon.

Last winter, at an evening party, M. Eudoxe Marcille learned by the strangest chance that some woodcutters having been employed in June 1872 to fell trees on a piece of land near Metz, laid waste by the Prussians in 1870, one of these wood-cutters in a leisure moment told the lady that she would wonder at seeing him get his living in that way, if she knew that he was the

son-in-law of a great painter, "who painted a child hovering over the water." The wood-cutter, who was in the timber trade, had seen his wood-yard plundered by the Germans, and had no means of livelihood left but his axe. After the war, not wishing to change his nationality, he settled at Blois with his wife, who was Prud'hon's youngest daughter. They are in extreme poverty.

The Messrs. Marcille at once opened a subscription. But France, accustomed for so many centuries to see the Church, the Sovereign, or the State the dispenser of charity, does not yet know how to take on herself to repair the ill-fortune of the children of those geniuses who are the true jewels of her crown. The subscription produced very little, and its promoters thereupon determined to exhibit all the father's works that they could collect for his daughter's benefit. The Ecole des Beaux-Arts granted them the use of its large gallery looking out on the quay. Such is the origin of this benevolent undertaking, which has been to many no less than a revelation of a sensitive, vigorous, and unaffected artist, whose drawings—that is, the emotions which he felt when face to face with nature—are for the most part superior to his works executed on order, and especially to his paintings, which have suffered much by deterioration of pigments and varnishes.

The catalogue contains 518 items, thus distributed:—Portrait paintings, forty-eight. There are two dated 1796, painted at Dijon. The portrait of a gentleman, half-length, holding a horse by the bridle, is very energetic. That of a lady, M^{de} Anthony, shows a charming young mother clasping in her arms her little daughter, who is standing on a table, while her little boy is tugging at her skirt. A delicious portrait of a young woman seated, with her hands folded in her lap, dated 1792, represents *Citoyenne Copia*, wife of the engraver who interpreted Prud'hon's designs so successfully. Never did a sweeter smile play over lips more arch than hers. The costume is piquant and modest, the expression of the face frank and amiable. There are many official portraits, among others two of Prince de Talleyrand, who bears on his face the stamp of the seven deadly sins. But the figure which, above all the rest, stirred, troubled, and charmed the painter's soul, is that of M^{lle}. Mayer, his pupil and mistress, who watched over him with a woman's devotion, and whose death, self-inflicted for his sake, dragged him with her to the tomb. She was not beautiful; she had a round forehead, a short nose, high cheek-bones, and a large mouth. But her large black eyes were animated with wonderful fire. That faun-like gaiety which Leonardo da Vinci and Correggio sought after played over her face, and gave a tinge of wildness to her ways. She had passed through Greuze's studio. She knocked one day at Prud'hon's door, who was filled with gloom and bitterness by a marriage with a vulgar and violent creature, contracted at the age of twenty to atone for an indiscretion. He received his visitor with repugnance. Later on, death alone could break the alliance of two hearts made for one another. She used to block out—badly enough, by the way—her master's compositions on canvas. He was ambitious of making her a perfect artist, and drew for her in detail all the figures in her compositions. It is to this that we owe all his studies of a Naiad, driving Cupids from a fountain's brink by throwing water in their faces.

After the portraits come four subjects taken from the Old and New Testament. But Prud'hon, though brought up out of charity by the monks of the Abbey of Cluny, was a son of the Great Revolution, and a pagan in his soul. He translated the Bible in accordance with the spirit, not the letter. His *Joseph and Potiphar's Wife* is a scene from the antique, glowing with the most ardent fire of adulterous passion. The first eight designs which he sketched for the figure of Woman, recall, fugitive as is the sentiment suggested in the face and spring of the limbs, the verse of the *Phédre*—

"C'est Vénus tout entière à sa proie attachée."

The sketch of the unfinished *Christ on the Cross*, now in the possession of the Louvre, is, on the other hand, inspired by a dramatic sentiment which is purely human. He also left unfinished a great mystical composition, which occupied his last hours after the death of his mistress—the *Soul delivered from the Bonds of Earth flying towards Heaven*. The painting which he there sketched is weak, but his studies after the model for the figure of the Soul, who is taking her flight with her arms raised and legs floating in the air, show infinite delicacy and grace. There is no need to know their romantic purpose to feel that they are the work of an artist deeply possessed and penetrated by his idea. Such is its radiance that there is no visitor who does not stop before these strokes of white chalk which have run over the blue paper. For you know that such was Prud'hon's mode of proceeding. He began by bringing out, by means of light, the roundness of the bodies and the portions of his background that were to be in relief; not till then did he indicate the shadows with black chalk or the stump.

A few early Italian, especially Florentine, artists have done the same in their designs *à la mine d'argent* on paper tinted rose or blue. But such seems to have been above all the method of Da Vinci, as may be gathered from his drawings in the Louvre. You know Prud'hon's passion for that master. Born at Cluny, April 4, 1758, the tenth son of a stone-cutter; brought up by his mother, a woman of a gentle and shrewd disposition; found out and taken in hand by the monks of the Abbey, who sent him to Dijon, he won the affections of an amateur at Beaune, who sent him to Paris. He returned to Dijon in 1784, and, thanks to his master Devorge, a provincial painter of no individual talent, who had the most extraordinary influence over the development of his genius, he won the prize offered by the States of Burgundy, and left for Rome. There he saw but one single master, Leonardo da Vinci. In one of his letters, written in the style of the Revolution, whose declamatory tone suits artists so well, he says that he fell on his knees before a piece of tapestry representing the Last Supper. And Da Vinci's disciple he remained. He saturated himself with his spirit. He seized the secret of the serpentine and undulating grace which passes from the swelling busts to the supple limbs, the bending joints, the long and slender hands and feet. He was smitten in his turn with the hard mystery of the smile of which *la Gioconda* is the best type, but he substitutes for the perfidy of Milan the delicate coquetry of France.

Perhaps no artist since the time of the Greeks has perceived and expressed the twin seductions of female form and female passion so well as has Prud'hon. Severity and voluptuousness share his work in equal proportions, or rather are so perfectly intermingled, that the one never triumphs at the expense of the other. He alone has been able to translate without addition, and almost without diminution, all the pages of the delicious pastoral of *Daphnis and Chloe*. His sketches for Didot's edition are to be seen here: Daphnis and Chloe in the bath; Daphnis taking from Chloe's bosom the grasshopper which has sought refuge from the pursuit of a swallow; Daphnis and Chloe fighting playfully like the kids of their flock. Nothing is more sincerely chaste, more innocently nude, more expressive, and more eloquently beautiful. Prud'hon excelled in casting over Nature that kind of transparent robe of which poets alone can give an idea with the help of the radiance of words. But if this may be admitted with regard to compositions in which the scene itself expresses a given meaning on the spectator's mind, it is much more marvellous when applied to a vulgar model. Prud'hon often drew a model called Marguerite. However beautiful we suppose her to have been, we must also suppose her to have had the vulgarities, the imperfections, the fits of weariness to which flesh is subject. But Prud'hon, while

making her very like—for with a little practice you can recognise in all instances the arms, legs, and bust—Prud'hon transfigured her. He made of her a kind of Olympian creature, worthy to put on the irresistible cincture, or to sit on a rosy cloud, or to pour forth ambrosia to immortals whose thirst was never quenched, having nothing in common, save the general type of feature and of limb, with the woman who put on her shoes, stockings, and gown at the close of the sitting.

This grace, if we carry ourselves back to the time when it appeared like a pure star coming above the horizon, spreads a radiant and gentle light over the age of the Revolution. David was the stern licitor of the age. Prud'hon was its artist *par excellence*, as André Chénier, with whom he has certain points of resemblance, was its melodious singer. He is intoxicated with its promise, with its struggles, with its cries as of a woman in her travail, with the blood that courses in so strong a current through its veins. The son of a poor working man, he knew nothing of the languor of that ancient society which was falling like a stately building whose piles have been fretted away by the waves. He must have had a close view of the infamous morals of the priesthood in his day, for he regarded even those who had brought him up with crushing contempt. His sensitive soul, whose love for solitude had been increased by *ennui* during his stay at Rome, was ready to receive the sentimental and devout doctrine of Jean Jacques Rousseau. When the Convention, which, on the proposition of Louis David, had dissolved the intolerant Royal Academy of Painting and Sculpture, established a competition for the great prizes of Rome, and nominated a jury of fifty members, Prud'hon was on it, with Monge, Berthollet, Talma, Pache the Mayor of Paris, Laharpe, and others. The judges had to state their reasons for their awards. Prud'hon wrote of the candidate whom he selected for the prize in painting, this singular phrase: "He is the only one in whom I have seen the germ of great talents, sentiment."

The drawings, which were engraved by Copia, and proofs of which must be in your public libraries, have a very powerful plastic effect. He had felt how important it is to speak through the eyes to brains which have never yet received through the medium of reading the great notions of enfranchisement. I mention these designs because we find here either the first hints for them, or else highly-finished pen-drawings made to facilitate the engraver's task. Their titles are characteristic: *Liberty*; she has overthrown the hydra Tyranny and broken the yoke of Despotism. *Law*; the weak finds strength in the Law which protects him. *Equality*; men are equal in Society as in the presence of Nature. Already had that supple talent, which treated of politics without preserving their Jacobin rudeness, composed those scenes, so lovely in their mannerism, *Love reduced to Reason*, the *Cruel laughs at the Tears that he causes others to shed*. He had also given five vignettes for an edition of the *Nouvelle Héloïse* which never appeared, the most striking of which represents the scene in the grove, and is entitled *The First Kiss of Love*. In a moment of rage he drew a horrible caricature in profile of the High Priest of the Théophilanthropes, Le Réveillère Lepeaux.

This Exhibition, the historic interest of which is almost equal to its purely artistic interest, enables us to follow Prud'hon in his busy career. Neither all our museums nor all our amateurs have lent what was in their possession, but drafts and indications serve as land-marks. Without stopping at the portraits of Josephine, seated at the corner of a grove in the park at Malmaison, or of the King of Rome, we find here the sketch of *Diana imploring Jupiter*, the painting of which is at the Louvre; *Justice and Divine Vengeance pursuing Crime*, a tragic composition painted to order for the Salle of the Cour d'Assises at the Palais de

Justice; *Psyche asleep carried off by the Cupids*; *Zephyr hovering over the Water*, the original of which was painted for M. de Sommarive.

In despite of David's pupils, who had no great esteem for this suppleness of muscle, this ardour of gesture, this life by the light of heaven and by the beating of the heart, this veiled poetry, these hints at landscape which give us a foretaste of the modern doctrine, and particularly of the work of Corot, Prud'hon was nominated a member of the Institute in 1816, when it was reorganised. But in spite of the official favours of the preceding Government, in spite of his contributions to the Salons, he could not overcome the repugnance of a public not yet softened by the romantic school, which saw in him only a vignettist, a poor devil who in his hours of distress had designed covers for boxes of sweetmeats, and drawn head-pieces for ministers' despatches.

The rehabilitation of this work, distinctly original as it is, so close to the antique and yet so modern, with its mixture of the Greek anthology and J. J. Rousseau, only dates from the last few years. It was an event when Eugène Delacroix made it the subject of a long and brilliant study in the *Revue des Deux Mondes*. This exhibition conclusively assigns to Prud'hon a niche among our greatest painters. But how slow is the march of justice in France, when the suitor does not belong to official cliques!

PH. BURTY.

THE INTERNATIONAL EXHIBITION: PICTURES.

THE exhibition now open in the great Kensington building is the fourth annual display, and is notified also to be the last. Human projects are always liable to possible collapse, or restriction, or extension: those with which Mr. Henry Cole has to do fall under this universal rule, and are more especially extensible. Whether this exhibition will really be the last, or only the last for a while, or not the last at all, or the last so far merely as the fine art collections, or some parts of them, are concerned—these are questions with which we shall not attempt to meddle *ultra crepidam*. We can say, however, that there will be little cause for regret if the fine art section of the scheme now comes to an end; in other words, to have no exhibition will be quite as good as to have the present exhibition, or will be better. From this remark we should except that sub-section of pictorial art which is concerned with the works of deceased painters. On the present occasion more than 300 works from the hands of the oil-painters Constable, Wilkie, Roberts, and Egg, and the water-colourists Coney, J. S. Cotman, Mackenzie, Prout, Augustus Pugin, and Charles Wild, have been collected together, and are no doubt of considerable interest, in various ways, to the lovers and students of our native art. We need not say here anything about the water-colourists in question. The assemblage of pictures by Constable and Wilkie does not amount to anything like a full presentment or complete indication of the art of either of these painters, but is, nevertheless, of substantial importance so far as it goes. We are greatly mistaken if the picture No. 154 ascribed to Wilkie and lent by Mr. Wynn Ellis, *Disputing the Will*, is really by the artist named: surely its style assigns it to William Harvey, the pupil of Haydon, so well known as a designer of woodcut book-illustrations. Roberts may suffer in reputation, rather than otherwise, by this gathering of his works: it was cruel to exhibit so foolish a falsity as his *Interior of St. Mark's, Venice* (75). Egg was one of those intelligent, talented, and skilled painters—not to speak of his personal amiability—who make, while their works have novelty to attract, and the fashion of the day to respond to, a reputation more than commensurate with their real ultimate deservings as fine art. In this exhibition one besetting default of his paintings impresses the eye—they are small in scope. Their purport and method are alike limited; one finds little spaciousness in them, and surmises

for them little of a future. Yet Egg was rightly held, during his lifetime, to compare advantageously with most of the other painters, however popular, whose aims and habits of work corresponded most nearly with his own.

As to the exhibition of new pictures, British and foreign, the first point worth noting is the relative numbers of these contributions. We leave out of count altogether the separated works "executed by officers in the army and navy;" and, adding up roughly the other numbers set forth somewhat dispersedly in the catalogue, we reckon, out of a total of about 2,100 paintings, only some 450 by British artists, and all the remaining 1,650 by foreigners. How comes it that the foreign element is so very largely predominant?

We entirely side with those who think that a handsome and generous reception should be given in this country to foreign art; that it should be fully and freely represented here; that the character and tendencies of the various schools should be understood, appreciated, and adequately studied, by Englishmen. But there is no good reason why strenuous exertions should be made by a public body for importing into England large shoals of indifferent or bad foreign works; why indifferent or bad foreign painters should be invited and stimulated to establish in this country a flourishing market for goods which ought to be unmarketable, not only in England but all over the world, and which, indeed, are doubtless, to a large extent, dead stock from the respective continental exhibitions of past years, unsaleable to the right-eyed and right-minded natives. To display and buy bad pictures is a positive detriment to public taste: if these pictures happen to be of alien origin, no diminution of the detriment is thereby attained, but, in addition, an injury is done to the pictorial profession at home. A. B., who knows nothing, and cares not much, whether a picture is good or bad, is prepared, from some motive of self-satisfaction or social conformity, to buy works of art. If he is left to himself, he fixes upon some production, more or less skilful, of an English artist; but if people who ought to know better parade before his eyes as worthy of attention the valueless performance of some foreigner, he chooses that instead. The cause of art remains unserved; a game of artistic blind-man's-buff proceeds with accelerated impetus and noise; and the only person to benefit is the bad foreign painter, who finds some British bank-notes gone astray into his pocket.

It is clear also that the display of bad foreign works in large quantities would naturally exercise a baneful effect upon the British section of the International Exhibition; and it has in fact done this most unmistakably. The space devoted to the foreign schools was at first equal to that appropriated to the British: it is now about thrice as large. Native artists, very diverse in point of capacity and of professional standing, used to send in their works; and some of those whose productions were laudable used to be rejected—partly because the space for native art was restricted, but partly likewise, no doubt, because the selecting body acted in individual cases injudiciously or unfairly. Discouraged by this state of things, the British exhibitors dwindle in number, in position, and in actual merit: till now one can barely pick out here and there an endurable picture by any of our own artists. This proves and constitutes the collapse of the scheme of annual International Exhibitions. They might have been made choice and fine in themselves, and a most valuable supplement, in the interests of the art of all countries, to the exhibitions of the Royal Academy and other bodies: but, mismanaged as they have been, they have exasperated and tired out our own artists, and have attracted from foreign regions little indeed of that sort of work which it is desirable either to look at or to buy. Let us hope that the directors will at least learn wisdom from experience. They have held successive yearly displays of the art of all the world, but have not succeeded

in making them good: a higher if a more confined ambition will be to get up henceforward good exhibitions—whether annual or otherwise, and whether from all quarters of the compass or otherwise.

From what we have just said, it will be apparent that we regard the International Exhibition of paintings of 1874 as important more for the warning which it conveys than for its particular contents. Our notice of the works themselves will be proportionately brief.

In the British section, it would be difficult to name any single picture important in subject-matter and scale, and competently handled, except *The Making of the New Forest*, by Mr. Burchett. This tells in a vigorous way, thoughtfully considered and diligently worked out, the story of the afforesting, by William the Conqueror, of the district which he wanted for hunting: "Men were driven from their homes, their houses and churches destroyed, the fruitful land was made a wilderness." The subject is truly a very fine one (Mr. Millais, in the earliest days of pre-Raphaelitism, chose it as matter for a pen-and-ink design): it affords ample scope for varied and forcible action, which, though rather tending towards unsightliness here and there, has been well handled by Mr. Burchett. Mr. Linnell is an illustrious exhibitor: *A Storm in Harvest*, however, is not one of his best pictures. In *The Surprise*, Mr. J. A. Fitzgerald has a picturesque subject, cleverly felt—some children of the time of Charles I. killing time in a garret, startled by a trooper who suddenly peers through the embrasure. *Paul on Mars Hill* is an unsightly-looking and unskilled water-colour, by Mr. Alexander Lauder. It has, however, that sort of peculiarity which belongs to the beginnings of a bold and independent-minded artist; and, if Mr. Lauder is as yet only at the opening of his career, we shall hope to encounter him again, progressing from year to year.

The French department contains a veritable master-piece in the *Moonrise* of M. Daubigny, almost the only picture which will linger long in the memory of those who visit the International Exhibition of the present year. The large full moon reigns over quiet meadows and slight hillocks; the peasantry and their cattle are closing the day's work—one more day so like so many others, yet all silently permeated by Nature's peace and dignity. If details are to be dwelt on and objected to in so fine and satisfying a work, we should say that the red tint of the principal cow, and of the woman's head-kerchief, is somewhat out of scale—too positive for the generally modified moonlit tone of colour. Another very prominent, and in its way very admirable, work is *The Mysteries of Bacchus*, by Jobbé-Duval, a large composition which excited much attention in the Paris Salon of last year, full of daring and well-nigh desperate action; nor is this by any means the only work which will be recognised, by those who have lately been in Paris, as an old and more or less valued acquaintance. *Narcissus and the Fountain-head*, by M. Machard, rather pompously catalogued as "the property of the French nation," is a refined and successful picture, though blemished by effeminacy. The veteran Biard furnishes as usual something genuinely and even irresistibly amusing—*The Artist's Studio in the Forest of Fontainebleau*. This studio, we find, is got up like a sort of "tropical department" in a Crystal Palace, with a female lay-figure swung in a hammock, monkeys prowling amid the trees, wild beasts ready for a spring, &c. The consternation with which a party of bourgeois visitors advance amid so risky-looking a population, while M. Biard himself is painting undescried in the artificial thicket, is expressed with much piquancy. A really well-executed little picture is the *Washerwomen at Cancale*, by Feyen; the figures are on a minute scale, singularly precise and complete. Duez's *Visit to the Tomb on the Anniversary of Death, in the time of Henri IV.*, is one of those presentments of bygone picturesqueness in subject and costume—partly

quaint, partly ceremonial, and partly also dramatic—in which the French excel: this is a talented specimen, without being better than a number of other works of the like aim. *A Dealer in Halberds*, by Lesrel, belongs to much the same class, with a decided turn towards the odd or grotesque; nor is the *Gaulish Scouts* of Evariste Luminais (one of them listening with his ear to the ground) of a very different tendency, though this comes nearer to the character of historical art. Mdlle. Nélie Jacquemart sends two good portraits—*Madame Charles Balsan* and *Marshal Canrobert*; and M. Karl P. Daubigny (the younger) a fine landscape, *Les Creuniers at Hennequeville, Calvados*. M. Clairin, in the Parisian Salon of the current year, has shown a decided—too decided—disposition to found his style on that of the greatest genius of the last few years in France, Régnault; in the International gallery, his *Carpet Merchant at Tangiers* indicates the self-same influence. It is extremely clever and brightly painted, though rather too gritty in surface.

The Belgian contributions are numerous. A printed notice from the Belgian Commission, hung up in the rooms, calls attention to "the unusually fine collection now exhibited," and urges that the opportunity should not be lost of purchasing "works of great merit." We cannot profess to agree in this estimate of the show, generally considered. One of the better exhibitors is Charles Soubre, whose *Noble Family (Gueux) before the Council of Blood* is an important work, treated with more than average ability; a second painting by this artist, *Katharine of Arragon and Cardinal Wolsey*, is a common affair enough. *Lent in the Convent*, by Charles Hermans, is replete with talent and dexterity: a brotherhood of Dominicans is shown seated at refectory, and one of them holds out a dish of milk to a cat. Another observable but rather dull work, by the same painter, is *The Parents' Sunday Visit—a scene in St. Pierre's Hospital for Sick Children in Brussels*. Albert and Julius De Vriendt, both of them well-known as of the school of the late Baron Leys, are among the exhibitors. By the former, *Charles V. and Marguerite de Ghenst* is a creditable and even an able example; but few things could be stupider than the *Othello* of the latter (Julius), who represents the Moorish general of Venice as a woolly-headed negro. This picture is dated 1869, and is therefore a sin of some years ago, perhaps by this time repented of. M. Cleynhens again is a Leys-like painter, whose *Bibliomania* attests a hand of ample skill. *After the Winter, Banks of the Meuse*, by T. Scharner, is an effective landscape—a heron broods amid the melancholy watery flats. J. E. Van den Bussche is the author of two striking works. *The Last of the Romans*, a picture of very large dimensions, shows the palace of a luxurious Roman, in which a revel is going on at the moment when the barbarian conquerors enter the apartment. The aged father, finding resistance impossible, has sufficient force of mind to stab himself with his sword; the son remains sunk in lethargy and enervation, although his mother urges him to be not unworthy of his race. These and many subsidiary points of an appropriate kind are powerfully impressed on the spectator in a work of which the technical merits, if not exceptionally great, are still considerable. *Margaret drowning her Infant* (from *Faust*) is a much smaller composition by the same painter, but fully as good: the terrible incident of the frenzied and guilty mother at the moment of detection being realized with genuine simplicity as well as depth of emotion.

The Italian pictures include one work of uncommon excellence—*The Last Supper of Mary Stuart*, by Francesco Valaperta. Here is much concentration, along with true, forcible, and dignified expression; and there is nothing in the execution to obstruct these qualities from producing their due effect. *Trusting a Secret*, by Pietro Bouvier, is a clever work in what may be termed the "dressy" style of art—a style to which Alfred

Stevens, Toulmouche, Tissot, and many others sparsely over all Europe, contribute a handsome quota of talent which might be better applied in the long run. *The Day is Done*, a peasant subject by Ferroni, is pale and rather wooden in manner, but shows a certain purity of taste.

In the German collection, the *Roman Chariot Race in time of the Emperor Domitian*, by Professor Alexander Wagner, at once arrests attention. The horses are shown galloping right forward in the picture—or out of the picture, as one might prefer to say; and the straining excitement which possesses alike the horses, the charioteers, and the spectators, is rendered with a vehement force which all eyes can appreciate. Such a work undoubtedly represents a great deal of study and observation, as well as vigorous executive powers, for all of which the painter should receive no stinted measure of credit. At the same time, nothing here is excellently good, though much is surprising; and the entire work is alien from the true purposes of fine art. Something of the like sort might be said concerning Herr Meisel's picture, *The Last Meeting between Louis XVI. and his Family*: here, however, the objection applies not to the subject itself, nor to the general scheme of arrangement, but to the showy, over-dexterous style of execution. Wilhelm Leibl is another artist with whom dexterity evidently counts for much in art. His *Frenchwoman of the Present Day* (a fashionably-dressed person smoking a thin clay pipe), and his *Peasant Woman with her Child*, show a style somewhat between those of Alfred Stevens and of Whistler, though clearly inferior to either. Kuppelmayr's *Italian Concert* is an able got-up affair, of the sort that one sees photographed on a large scale, and sold to people who buy effective and well-handled furniture-pictures or furniture photographs. A work respectable in a different way is *The Baptism of Christ*, by Veit, in the style which wavers between pietism and weak-mindedness. *A Dream*, by Von Korwin-Milewski, may finally be mentioned as a production having some force of feeling, taking a poetic or semi-poetic direction; it is a combination of temple, vast cypresses, lovers, twilight, and other such material.

There is no satisfaction in protesting against mere incompetence; but, when an International Exhibition comes to displaying works so wretched as those which form a large proportion of the present gathering, the critic is almost bound to cite a few illustrative instances. We will simply ask why such performances as the following are hung at all—and hung, moreover, for the most part, in very good places on the walls. We refer, among the foreign pictures, to—Köbel, *Ruins of a Monastery on the Gulf of Spezia*; Köckert, *Hay Harvest on the Chiemssee*; Vander Ouderaa, *The Present and the Future*; De Bruycker, *A Botanical Lesson*; Kuhnen, *The Verge of the Wood*; Risse, *Ophelia adorning the Willows*; Walraven, *The Intrusion*, and *Going to School*; Van Starkenborgh, *Morning in Thuringen*; Verheyden, *The Artist*; Van Seben, *The Fowler*. Also, among the British pictures, Holmes, *A Nibble*; James Cole, *Playful as a Kitten*. W. M. ROSSETTI.

LAST DAYS OF THE BARKER SALE.

FOUR days of last week were occupied with the decorative objects of the Barker sale. As it relates to above 700 lots to be sold, it would be useless to attempt other than a general report of the sale. Beginning with maiolica, Mr. Barker had still retained a few choice pieces of his fine collection. Lots 123 and 124. A pair of small ewers, with classical subjects, sold for 300 gs. Of the Maestro Giorgios, lots 125, 126, and 130 fetched the several prices of 120, 108, and 106 gs. Lot 129. A dish with female head and arabesque border, 200 gs. Lot 131. A Xanto, Apollo and Daphne, 80 gs. The *cheval de bataille* of the Sévres porcelain was Lot 105, a *garniture de cheminée* of five vases, bleu de roi, white and gold, already

described in the ACADEMY of the 6th inst.: they were knocked down for 2,250 gs. Lot 166. A pair of Duplessis (elephant-handled) vases of turquoise ground, rather pale, 220 gs. Lots 134 to 138. A Sèvres dinner service of 66 pieces, feuille de chou, painted with trophies, 615 gs. Lots 162, 163. Pair of soup tureens, green grounds, beautifully painted and mounted in ormolu, 255 gs. Lot 467. An éventail jardinière, with medallions of birds, 650 gs. Lot 164. A pair of square pots, "caisses," painted with fruit and flowers, in medallions, and hyacinth plants of ormolu with Sèvres porcelain flowers, 190 gs. Lot 324. Another pair, with ormolu foliage and porcelain flowers, 245 gs. Lot 322. The model in Sèvres porcelain of Marie Antoinette's dog, found in her dressing-room in the Tuileries after August 10, 1792, 95l. Lot 584. A Frankenthal group, pastoral subject, 14 in. high, 50 gs. The Sèvres biscuit, all charming figures after Falconnet, were purchased for the South Kensington Museum. Lot 471. A pair of nymphs bathing, 27 in. high, 66 gs., the others ranging from 26 to 35 gs. Lot 564. A fine panel of early Flemish stained glass, the Annunciation, 22 gs., was also bought for the South Kensington Museum. Lot 232. A marble bust of Marie Antoinette, 210 gs. Lot 496. An amber casket, 70 gs. Lot 652. A silver statuette of the Virgin and Child, 20 in. high, by Hufnagel, the celebrated goldsmith of Augsburg, of the sixteenth century. One of the same subject in the Kunstkammer, at Berlin, 200 gs. The chief feature in this remarkable sale was the extraordinary assemblage of decorative furniture, some Italian, but mostly French, of the periods of Louis XIV., XV., and XVI., to the last of which belong the elegant productions of Reisener and David, with the chased mountings of Gouthière. Of the Louis XIV. period are the tortoiseshell and brass marquetry, to which its inventor, Boulle, gave his name. Lot 204. A pair of black boule commodes, 260 gs. Lot 303. Pier table of black boule, 235 gs. Lot 395. Two triangular tables, black boule, 290 gs. Lot 397. A cabinet, black and white boule, with Louis XIV. as Hercules, in ormolu, 160 gs. Lot 212. Magnificent library table, entirely of tortoiseshell, with massive ormolu mounts, terminal figures, &c., 190 gs.; and the companion (213) 220 gs. Of the Louis XV. period, with its rococo undulating scrolls, &c., were: Lot 207. A pair of encoignures of marquetry, mounted in ormolu, 220 gs. Lot 221. A writing table, mounted with dolphins in ormolu, 135 gs. Lot 693. Another, with bouquet of flowers in marquetry, sliding top, and ormolu mounts, 275 gs. Lot 695. Commode, with breccia slab, 270 gs. Lot 346. A pair of gilt chairs, carved backs, and seats covered with blue satin, embroidered with Chinese figures, 62 gs. The specimens of the pure, elegant style of Louis XVI. were numerous. Lots 182 to 186. Eight chairs carved and gilt, covered with white satin, and embroidered with flowers, 140 gs. Lot 205. Library table, festoons of foliage in ormolu, 410 gs. Lot 205. A pair of encoignures of marquetry with ormolu mounts, 220 gs. Lot 218. Cabinet of black and gold lacquer, with ormolu in the style of Gouthière, 295 gs.; and (lot 222) secretary of similar style, 150 gs. Lot 219. Tulip-wood cabinet inlaid with Sèvres plaques, wreaths and columns, style of Gouthière, 230 gs. Lot 269. Secretary, Amboyna wood, with Sèvres plaques, and mountings à la Gouthière, 310 gs.; and another (lot 379) similar, with Ino and Bacchus in ormolu relief, 125 gs. Lot 284. Clock, vase-shaped, ormolu, with figure of Cupid and a nymph seated pointing to the hour, 200 gs. Lots 701 to 704. Circular tables, eighteen inches diameter, inlaid, and with Sèvres plaques inserted, sold for 95, 80, 105, and 70 gs. Lot 220. The fine oval table, by David Roentgen, of Lunéville, the top representing Aeneas and Anchises in coloured marquetry, tinted in various shades by burning, was bought for the South Kensington Museum, 400 gs. Lots 513 to 516. The Venetian State

chairs, elaborately carved and gilt, with high backs and seats covered with white satin embroidered with magnificent vases of flowers in coloured silks, sold for 105 and 110 gs. the pair. Unfortunately, a specimen was not secured for the National Museum. Lot 517. Another pair covered with embroidered white Genoa velvet, 19 gs. Lots 518 to 521. Eight carved and gilt arm-chairs, 34 gs. the pair. Lot 676. Pair of Tudor chairs of ebony, carved and high backs, 140l. Lots 679 to 684. Ten Italian ebony chairs, inlaid with ivory, spiral columns and yellow velvet seats, 100l. the pair. Lot 526. A Venetian pier table, with splendid slab of the rare bianco e nero antico marble, 220 gs. Space prevents any further enumeration of the prices given for the other lots in this the most important sale that has occurred for years.

ART SALES.

OF great interest was the sale, last Friday (12th), by Messrs. Christie, Manson, & Woods, of a collection of Sèvres, Chelsea, and Bristol porcelain. Of a dessert service of old Bristol, the two sugar tureens and covers (48 and 49) sold for 230l. Lot 51. A pair of heart-shaped dishes, 50 gs.; and twelve plates at from 20 to 22 gs. the pair. The Bristol figures (Lot 59) Earth, 55l. Lot 59a. Fire and Water, with the T.O. mark, 123l. Lot 60. Autumn, a girl with a basket of fruit, a charming figure, beautifully modelled, 108 gs. Lot 148. A Chelsea vase, 21 in. high, Chinese subjects on a gold ground, 1,600 gs. (Earl Dudley). Lot 149. A pair of oviform vases, painted with flowers, 690l. Lot 148. A pair of jardinières, claret ground, exotic birds, 400l. Lot 147. An inkstand, green ground, painted with Cupids, 65l. Lot 146. A two-handled cup and cover, with exotic birds, 230 gs. There was a choice collection of Sèvres cups and saucers, from the cabinet of Capt. Ricketts; and (Lot 133) an oviform vase, bleu de roi ground, with military subjects by Morin, 13 in., 1,750 gs. (Earl Dudley). Lot 139. A pair of menteiths (verrières) feuille de chou pattern, 105 gs. Lot 132. An oviform vase, bleu de roi, with ram's head handles and festoons of flowers in relief, 165 gs. Two rose du Barri jardinières, painted with exotic birds by Aloncle, 2,450 gs. Lot 143. A pair of small vases, the handles forming nozzles for candlesticks, turquoise, beautifully painted, 9 in. high, 500 gs. Lot 150. The last and crowning lot of the sale, the three vases of Lord Coventry—the "vaisseau-à-mât" and the jardinières—rose du Barri and green, painted by Morin. They were knocked down to Mr. Rutter for 10,000 guineas. Nothing could exceed the beauty of the centre vase, for those who could reconcile themselves to such a combination of colour. The "rose" of the jardinières hardly equalled it in tint.

SOME modern pictures were sold, June 13, at Christie's, and fetched the following prices in guineas:—H. Lehmann, *Venus disarming Cupid*, 285; G. H. Boughton, *The Age of Gallantry*, 350; F. Walker, *The Old Gate*, 1,000; Millais, *Flowing to the River*, 1,590; G. Mason, *Girls Dancing*, 850; and *Roman Campagna*, 360; F. Heilbuth, *Spring*, 320; Constable, *Hampstead Heath*, 890; J. C. Hook, *The Cowherd's Mischief*, 600; *Story of Torrello*, after Boccaccio, 580; and *Sea Air*, 995; W. A. Collins, *Near Cromer*, 290; and *River Scene, Children in a Boat*, 380; D. Cox, *Haddon Hall*, 133; *Landscape*, 200; and *Barden*, 285; W. Müller, *Low Life*, 740, and *Mill near Conway*, 1,400; J. Linnell, sen., *Homeward Bound*, 835; *Summer Eve by Haunted Stream*, 795; and *The Ford*, 725; B. Rivière, *For Sale*, 300; C. Troyon, *Going to Market*, 450; W. Linnell, *Rabbit Holes*, 440; Edward Frere, *The Shell*, 690; Jules Dupré, *A River Scene*, 480; P. J. Clay, *A Calm, with Shipping*, 300; I. Israels, *Going Home*, 310; Old Crome, *Norwich by Moonlight*, 385; D. Roberts, *Interior of S. Pierre, Caen*, 200; W. Holman Hunt, *Dolce far niente*, 400; R. Ansdell, *Seville*, 540; J. W. Turner, *The Whale Ship*, 915; F.

Leighton, *A Syracusan Bride leading Wild Beasts in Procession to Temple of Diana*, 2,550; T. Creswick, *Landscape, with Cattle*, 132; W. Etty, *Flowers of the Forest*, 190; Kiörboe, *The Inundation*, 280; Peter Graham, *After Rain on the Tummel*, 200; E. Nicol, *Donnybrook Fair*, 290, and *The Irish Doctor*, 305.

THE china of Mr. Colson Taylor was sold at Sotheby's on the 9th and 10th. A pair of Bow figures of a lady and gentleman, the one with her apron filled with flowers, the other with a basket of fruit by his side, sold for 48l. A pair of figures, harlequin and columbine, 40l. 5s.; and a pair of sphinxes, 10l. Of Chelsea, a pair of superb vases, flattened form, gros bleu ground, and subjects beautifully painted after Boucher, 13 in. high, 414l. Three less important, with flowers in relief, 56l. A pair of figures, 50l.; and a suite of five vases, with double handles, turquoise ground, encrusted with May flowers and snowdrops, 80l. The teapot belonging to a tea service, with turquoise and oil-de-perdrix borders (gold anchor), fetched 20l. 10s.; and cups and saucers of the same service, from 7l. to 8l. A Nantgarw plate, 12l. 5s. Two Bristol figures, a boy and girl, 54l.; and a set of four salt-cellars, 36l. The Toft dishes, 6l. and 6l. 6s. Two vases of Turner's ware, 17l. 10s. The Liverpool tiles, transfer-printed by Sadler, representing the principal dramatic performers of the day, ranged in price from 1l. to 1l. 18s. Of the transfer-printed Worcester, a King of Prussia mug sold for 11l., and a small one 7l. 5s. The Worcester porcelain was of the highest quality. A magnificent set of five vases, gros bleu ground, with groups of exotic birds in heart-shaped medallions, was sold to a Brighton dealer, Mr. Button, for 660l. A grand hexagonal vase, also deep blue, with birds and butterflies, sold for 180l. A circular compotier, gros bleu, 46l.; and smaller dishes of the same service, for from 10l. to 15l. each. A plate with green enamel decorated with dragons, the crescent mark in gold, 13 guineas. The display was beautiful, and the sale excited much interest.

At the sale at the Hôtel Drouot, June 4, of the marble and terra-cotta works of M. Carrier Belleuse, the following were among the prices obtained:—Two *Cupids*, 2,220 fr.; *Persecuted Innocence*, 2,000 fr.; *Marie Antoinette*, 990 fr.; *Undine*, 1,900 fr.; *Angelica*, 1,200 fr.; *Love Disarmed*, 2,410 fr.; *Temperance*, 3,200 fr.; *The Conquérant*, 3,160 fr.; *Psyche*, 1,160 fr.

NOTES AND NEWS.

"THE telegram," says the *Levant Herald*, of the 8th instant, "announcing the reversal by the Hellenic 'Cour Royale' of the decision of the Court below on the question of the competency of the Greek tribunals in the Schliemann case, is being followed up by active measures on the part of the police to recover the stolen treasure. A despatch received this morning states that the Areopagus having decided to entertain the complaint of the Imperial Ottoman Museum—which was in effect that Dr. Schliemann had carried away to Greece Trojan antiquities discovered at Hisarlik which belonged to Turkey—ordered the objects in question to be seized by the officers of the Court. Dr. Schliemann, however, had availed himself of the delay which occurred in obtaining the quashing of the first judgment to pack up all the antiquities in his possession and have them conveyed to a place of keeping which he refuses to disclose. The police, however, will doubtless speedily find out where they are concealed." We must refer our readers to the same journal of the 6th instant for a minute history of the whole of this singular litigation, which at one time threatened to assume the proportions of a new Eastern question.

THE South Kensington Museum have now on loan, and exhibited by the side of King Koffee's state umbrella, some of the gold ornaments and other

spoils of Ashantee. Various gold badges, a mask, the eagles, antelopes, scorpions, sandals, leopard-skin cap, &c., before shown at Messrs. Garrard's, and which have now passed into private hands. A ram's head in gold, weighing 41 oz., belonging to the officers of the Artillery. The pipe with gold bowl, mouthpiece, and ornaments, bought by the South Kensington Museum. The sacred dress of a fetishman, his lizard-skin bracelets, and various aggrary bead necklaces. In addition to these are the already-known state sword, the sword of the executioner, various wooden combs, and a specimen of the edible snail, so abundant in Ashantee.

It has been decided by a sub-committee of the trustees, that the proposals of Mr. F. P. Cockerell, architect, for the reconstruction of Hampstead Parish Church shall be adopted. This plan provides for the removal of the old tower, so well known to those who visit Hampstead, and the erection in its place of a new steeple from the designs of Mr. Cockerell. The "ivy-mantled" eastern front is to be destroyed, and transepts are to be added, together with an apsidal termination. The side walls of the old church are also to be removed, and an additional aisle is to be erected on each side of the nave. The galleries are also to disappear. The roof and pillars of the old church are retained, and the western transept, which is modern, is, of course, to be preserved. The style of the new work is Italian, with some Lombardic features. The tower is to be carried up without buttresses, terminating above the belfry in four flying buttresses, of novel design. Upon the top of it is to be placed a small timber spire. The new aisles are lower than the existing ones, but not sufficiently so to admit of the introduction of a clerestory or the retention of the present one. They are to be roofed with a series of semi-domes, which will show externally, producing an uncommon effect. Provision is made for lighting the interior by windows pierced in the new walls, the sills of which are placed unusually low to give greater window-space. These windows are of two lights, with tracery of Byzantine character. It is considered that by this arrangement the light may ascend even to the groined ceiling of the nave. The interior of the present church is perhaps wanting in height, and in spite of its two ranges of windows the light is not excessive. It is thought that the erection of additional aisles with windows arranged as described will improve both the proportions and the lighting. The cost of the alterations was originally fixed at £6,500., but the works now proposed will considerably exceed that amount. The whole sum required is to be raised by voluntary subscription.

A FRANKISH cemetery containing numerous burial-places has been discovered at Belfort. It appears to have occupied the site of a former Gallo-Roman village, and numerous fragments of armour and personal ornaments, mixed with Roman pottery, were found in the course of the excavations. Two tombs, one Gallo-Roman, and the other mediæval, have been discovered on the Roman road from Breith to Poitiers; the latter contained a large number of silver coins, chiefly of Philip VI. of Valois.

It is announced from Beyrouth that a large party of Prussian explorers have begun excavations at Tyre with a corps of over one hundred workmen, and it is thought that Baalbec may soon be visited for the same purpose.

THE Germans appear to be as supreme in the archaeological as in the political world. At least, a letter in a French journal endeavours to show that they have a perfect right to take measures which would be the death-blow of the French school at Athens. In the convention recently concluded between the Greek and German governments is the following clause: "Germany reserves the exclusive right, for five years from the date of discovery, of taking impressions or mouldings of objects found without her co-opera-

tion." This would satisfy even an archaeological Bismarck.

CASTS have been taken at the Hôtel Carnavalet of the remarkable sculptures of Jean Goujon. Besides those between the windows facing the entrance, and those in the interior, there is over the archway of the second door, seen only from the middle of the courtyard, a composition of three women, two reclining upon the sides of the arch, and one standing upon the keystone. In drawing, grace of attitudes, and elegant disposition of the draperies, they yield in nothing to the finest Italian work of the Renaissance.

THERE is a report in London that the Piero della Francesca and the Crivellis, bought for the nation at the recent Barker sale, were acquired at the special instance of Mr. Disraeli.

THERE is now exhibiting at No. 15 Jermyn Street a dessert service of Sèvres porcelain, consisting of 105 pieces, said to have been the present of the Empress Catherine to her ambassador at the Court of Versailles, and to have lain forgotten in some remote Russian château until lately discovered and brought to light. The service is of turquoise blue, *pâte tendre*, of the date 1766, and is decorated by Aloncle with paintings of the "exotic birds" then so much in fashion. The plates are white, with borders of turquoise blue painted with exotic birds in medallions and large subjects in the centre. The ice-pails, flower vases, compotiers, menteiths, and other large pieces, are entirely of the turquoise ground with very rich gilding. An enormous price has been already offered for the service, but it is said that its owner, a foreign prince, will not take less than 12,500*l*.

THE *Chronique* hears from Geneva, that among the manufactures of that town may be reckoned that of counterfeit paintings by Courbet. These pictures are sold principally out of Geneva. Apocryphal paintings by Calame also, the *Chronique* affirms, are continually passing the frontiers in search of dupes. Let purchasers beware!

A *catalogue raisonné* is announced of the works of Watteau, by M. Fancheux. The prices given at sales at various periods for Watteau's works have been diligently sought out by the writer, and much other information collected. The book will no doubt be of use to collectors.

THE four large paintings, said to be by Paul Veronese, that we mentioned some weeks ago as having been discovered by M. Marcille in the lumber room of an hospital near Chartres, are to be sent to Paris to undergo the scrutiny of competent judges.

M. LE VICOMTE DE CUMONT has entered upon his duties as Minister of Public Instruction in France, in place of M. Fourtou, now Minister of the Interior. Will M. de Chennevières find the new minister as ready to fall in with his vast projects for the promotion of art in France as his predecessor? Art decrees have been passed at a rapid rate of late, but few changes have as yet been effected.

It is announced in the *Paris Journal* that the National Exhibition of the Gobelins, Beauvais, and Sèvres manufactures will be opened about August 5 or 10, at the same time as the Fine Art Industrial Exhibition that will also be held in the Palais des Champs-Élysées. The Gobelins manufactory will send eight tapestries that have been designed by M. Mazerolle, after paintings by Correggio, Andrea del Sarto, and other great masters, for the new Opera-house. Beauvais will display a splendid collection of furniture; while Sèvres will contribute a series of vases of entirely new design. All the objects to be exhibited have been manufactured, it is stated, since the war.

A CONGRESS of French Architects is now being held in Paris, under the presidency of M. Henri Labrousse.

THE *Builder* states that "it is to be feared that a renewed attempt is being made to convert the site of Caesar's Camp, at Wimbledon, into building ground." A further encroachment has been recently made, it seems, by the owners of the land, who some time ago asserted their proprietorship by setting up a stout oak fence that divided the enclosure into two portions. Now they are venturing another step, by having some of the trees felled that form the great attraction of the "rounds." The *Builder* hopes that "measures will be taken to secure the *status quo* of Caesar's camp, and so prevent perpetual uneasiness about the too great probability of its destruction." But how can effectual measures be taken when Sir John Lubbock's bill for the preservation of ancient monuments is rejected?

At a meeting held last week, over which Lord Chief Baron Kelly presided, it was decided that the proposed memorial to the late Lord Brougham should take the form of a statue, to be erected in Westminster Abbey or some other suitable place.

A "HISTORY OF GLASS PAINTING," by Herman Druyts, is being published in *De Vlaamische Kunst-bode*.

A CELEBRATION was held last week in Bedford, on the occasion of the unveiling of the fine statue of Bunyan that the Duke of Bedford has given to the town. The statue is the work of Mr. Boehm, and represents the Puritan hero in the costume of his day, the likeness being taken from a contemporary portrait by Sadler. On the pedestal are subjects from the *Pilgrim's Progress*, sculptured in relief—in front, the fight with Apollyon, and on the sides the meeting of Christian with Evangelist, and the Pilgrim's release from the burden of his sins. The back of the pedestal is plain, but on it the words are inscribed: "It had eyes lifted up to heaven; the best of books in his hand; the law of truth was written on his lips. It stood as if it pleaded with men." These words evidently express the idea that the sculptor has endeavoured to embody in his work. The great tinker-dreamer stands with the open Bible in his hand, pleading for the truth. A broken fetter at his feet recalls to mind the imprisonment that this heinous crime brought upon him. The figure is nine feet high, and is cast in bronze.

THE June number of the *Gazette des Beaux-Arts* is chiefly devoted to the Salon. M. Louis Gonse is the critic, and he begins his work by criticising the proposed alterations in the direction of the Salon, and the re-foundation of a French Academy. "L'Art," he considers, "doit rester la plus fière des aristocraties, ne cherchons point à le démocratiser." Therefore, the Salon should not be held every year, nor be allowed to degenerate into a mere exhibition. Annual picture exhibitions could be organised by private endeavour, but the great exhibition (*Exposition*) of the State, the Salon, ought, as its name implies, to be something *de choisi et d'épuré*. It should be by its rarity a "fête of art, and a means of instruction." A good many fine sketches by the author from pictures in the Salon, and a splendid etching, by Walthner, of Carolus Duran's painting *Dans la Rosée*, illustrate the article. From the Suermont Gallery, of which there is a third notice by Paul Mantz, we are also treated to two fine etchings by Leopold Flameng, one of them from a portrait by Velasquez, and the other from a charming landscape by Troyon. A notice of Paul Baudry with a catalogue of his works is accompanied by a number of illustrations of his decorations for the new Opera house in Paris. French critics are singing a paean of triumph over this "gigantic achievement" of French art. Who, when he sees such a grand display of French genius as this, can doubt "that in matters of art, as in other matters, the future will belong to France," as a French writer modestly remarked a few years ago. The illustrations in the *Gazette*, however, will hardly convince unprejudiced critics (that is to say, critics who are not Frenchmen) that Paul Baudry's decoration of the Opera house

is "a great artistic event," or that it is likely, as his critic René Menard declares, to make "an epoch in the history of the French school."

The other articles of the number are a notice of the Alsace-Lorraine exhibition by M. Albert Jacquemart; a notice of Antoine Chintreuil by M. Albert de la Fizelière, and of Prud'hon and his works now exhibiting at the Ecole des Beaux-Arts, by M. George Duplessis. The usual bibliography of works on art published in France and in other countries during the past half-year completes the number. This bibliography is, no doubt, tolerably complete as to French works; but it is utterly insufficient as a catalogue of foreign literature. Very few English works are mentioned, and not one German.

It has been determined to proceed at once to carry out the plans projected for the restoration of the cathedral at Naumberg. It is estimated that 80,000 thalers will cover the expenses of restoring the interior to its original condition, and removing all the surrounding buildings and adventitious additions by which it has been disfigured, and as this building is one of the noblest specimens of early mediæval architecture in Middle Germany, the contemplated undertaking will be hailed with satisfaction by all lovers of German art. The edifice was begun in the time of Margraf Ekkehardt of Meissen, and completed in the first half of the thirteenth century. The statues of the founders which are inserted in the columns of the transept are not without value as specimens of early German plastic art, while the graceful individuality of the face and figure of the Polish Margravine Relegydis, wife of Margraf Hermann, who is represented in a graceful attitude with half-averted head, can scarcely be paralleled in any composition of that period.

THE STAGE.

It is again reported that Mr. Irving's next venture will be the performance of *Hamlet*.

MADAME PASCA's visit has come to a somewhat abrupt conclusion. The weather was too hot, and society too weary, for melodrama.

MR. CHARLES MATHEWS continues to be the chief attraction at the Gaiety Theatre, and very certainly it needs no better. He has this week been appearing in *Used Up*—a performance which we should have taken the opportunity of noticing at greater length, had it not, by reason of its frequent repetitions, become almost too familiar to good-class play-goers to need any further criticism or comment. The same theatre has produced a little one-act comic drama by Mr. J. G. Taylor.

For the benefit of the acting manager of the Olympic Theatre, there took place on Saturday afternoon, at the Gaiety, a performance of Sheridan Knowles's *Hunchback*: a play written, as all the world knows, not long before the production of "legitimate drama" wholly ceased, and when, alas! there was not much left of it except its form. But many actors cherish a reverence for *The Hunchback* perhaps second only to that which they cherish for *The Lady of Lyons*; and on Saturday afternoon more than one artist of some celebrity lent help to the performance of Sheridan Knowles's play. And the play was well received. But the greatest interest evoked on the occasion was in the first appearance of a lady, hitherto an amateur, now to be known, wherever she may appear, as "Mrs. Fairfax." She is, we believe, the wife of an officer who has rather lately contributed something to magazine literature; and, as Mrs. Fairfax is a lady who has not led the crowded life of a professional actress, it is almost unnecessary to add that she has written a novel. Her performance is pleasantly reported of. She brings to the stage some gifts and accomplishments not now too common there; but opinions differ as to the chances of her ultimate success; some of those who appreciate her the most having recognised in her performance a lack of apparent spontaneity.

Probably it has been a mistake to begin in the character of a leading heroine. For ourselves we admit that we view suspiciously the performance of anyone who does not begin at the beginning. Our best actresses, with scarcely an exception, have made slow way, with years of uphill work in country towns, or playing small parts in our London theatres. Of course, against this practice there has to be put the advantage of a larger and more general culture; but the balance, when it is struck, is generally found to be in favour of those ladies who have been on the stage from girlhood.

LAST night, at the Vaudeville Theatre, there was produced, for the first time at that house, for the benefit of Messrs. James and Thorne, Mr. Boucicault's comedy of *Old Heads and Young Hearts*. We are, of course, unable to speak of it to-day; but the performance (in which the lessees, and Mr. Farren, Mr. Righton, Miss Larkin, Miss Amy Roselle, and others, took part) will be criticised in our next issue.

THE second dramatic work of M. Paul Ferrier—*Tabarin*—was produced at the Français on Monday evening. His first showed his tendency to light comedy; it was called *Chez l'Avocat*; was concerned with what Balzac would have called some *petites misères de la vie conjugale*, and was acted chiefly by Coquelin and Mlle. Sarah Bernhardt. The new two-act comedy has for its subject, as the name implies, the celebrated buffoon of the time of Louis Treize, and though containing much that is spirited and amusing, it has also at one point a very serious interest, of which Coquelin made the most. The younger Coquelin assisted his brother, and so did Mlle. Lloyd, Mlle. Dinah Félix, Messrs. Boucher, Kime, and others.

M. VICTORIEN SARDOU is busy upon a long play for the Gaieté; a play which M. Offenbach will produce, it is said, during next winter.

SOME curious particulars with regard to the career of Rachel at the Français have just been published. Her first appearance was as Camille in *Les Horaces*, on June 12, 1838, and the receipts of the theatre on that occasion were only 28*l.*: that is, only about a sixth of the seats in the house were occupied; or, if occupied, they were occupied by what is technically spoken of as "paper"—persons who are admitted free because gratuitous representations are better than a "beggarly array of empty boxes." A few weeks later and she filled the theatre every night. Nearly all her early successes were gained in the classic tragedies. She appeared afterwards, as Ristori has done, in translations of the great tragedies of other literatures than her own. Then came the romantic drama—Cornelle gave place to Alexandre Dumas. But *Mademoiselle de Belle-Isle* was not among the most successful of her performances: one of the most notable performances of her later days was that of *Adrienne Lecouvreur*. Altogether she appeared in forty-five characters, of which the last created was in a drama now long forgotten—*La Czarine*, produced in 1855. Her genius was possibly greatest in her youth; her art most elaborate after ten years of practice; and towards the end ill-health told visibly and shockingly upon her work. A private life less agitated would probably have preserved to us for many years this woman—almost the most remarkable, almost the most agreeable, recent generations have seen.

FROM time to time one hears a good deal said about the inefficiency of some of the persons who contrive to be entrusted with prominent parts upon our stage; but one hears little of the incapacity of a far larger number of persons—the mass of those who at nearly every theatre in London represent the unnamed characters who figure more or less in nearly every drama. A correspondent, who has a claim to be heard, draws our attention to the point. These unnamed characters have nothing to say, except the unanimous "yes" or unanimous "oh!" which caused a famous personage to re-

mark that "when they *do* agree upon the stage, their unanimity is wonderful;" and because these characters have nothing to say, their representatives imagine that they have nothing to act. Are they a group of citizens supposed to be watching with interest some incident of the streets? Are they a group of market-women chatting at the fruit market?—their action, or their want of action, is generally open to the reproach that they do not for one instant imagine themselves to be the characters they are supposed to represent. The men, whether citizens, peasants, even guests at a party, appear to take as their model for behaviour the stiffness of a line of policemen setting out upon their beat. The women are entirely conscious that they are on the stage of a theatre, and that in front of them is an audience which does not wholly abstain from criticising their appearance. They adjust their caps, they adjust their bracelets, they gaze at their shoe-buckles, and carry on to the stage the minor operations of the dressing-room. Those whose business it is to arrange their movements consider their movements *en masse*, and these accessory characters hold themselves excused from considering their own movements at all, save with an eye to the effect which their appearance may produce among their acquaintances in the audience. This at least is true of very many of them; and yet those who care seriously for the improvement of the stage—we are not speaking of what is called its "tone," but its improvement as an art—cannot help remembering that each one of these accessory figures is none the less a character because a speechless one. To each one of them is open the whole wide field of gesture and of facial expression. It would be interesting to see, for once, what a great mistress of delicate expression—such an actress as Mlle. Desclée was, or as Mlle. Pierson now is—could make of the speechless part of a market-girl, with a life of her own of which the audience is to hear no word, but with a natural characteristic interest in the fate of the friends, the neighbours, the everyday acquaintances, whose story is unfolded throughout the piece. That opportunity, we venture to say, would be a lesson which would not be lost upon the spectators, though it might be upon the supernumeraries. It would point to a perfection which, indeed, could practically never be attained, but towards which we might well make some little onward step. The present behaviour of too many of the unnamed characters destroys the illusion of the stage instead of aiding it. They are not characters at all; the story, one says, has nothing to do with them; at best, they are but on the stage like the fine gentlemen used to be in the early days of the theatre—privileged spectators: nothing more. They encumber the stage, and stop the way of the story. And sometimes when they do not encumber it by their inaction, they encumber it yet more by their action. By strange antics they set on barren spectators to laugh, but (if we are to credit audiences with judgment) they offend many more than they please. Lately, one has heard something about "schools of acting." Of actual schools none could be a better one than that which the supernumerary actors at a good theatre are frequenting every night, but at which they learn almost nothing. They have good acting to observe, and they can observe it closely and repeatedly, and they have even some little opportunity, which any one among them destined to be great would surely seize, for practising the arts too little cultivated even by the more advanced of their brethren and their sisters: the invaluable and inexhaustible resources of gesture and of facial play.

MUSIC.

BALFE'S "IL TALISMANO."

BALFE's posthumous opera *Il Talismano*, or, to give it its English, and more appropriate title *The Knight of the Leopard*, was produced for the first time last Thursday week at Her Majesty's Opera,

Drury Lane. It speaks volumes for the present state of music, and especially of the opera, in this country, that the first performance of the last work of one of our most distinguished, as well as most distinctively English composers should be given in a foreign language and by a company composed entirely of foreign artists. It is useless, however, to enter into this subject now, especially as it is far easier to point out the evil, and even to indicate its cause, than to suggest a remedy. It will be more to the purpose to give some account of the work itself.

The subject of the opera is taken, as will be surmised from its name, from Sir Walter Scott's well-known novel. It was obviously impossible to bring the whole story within the compass of a three-act opera, and Mr. Arthur Mathison, the writer of the libretto, has therefore selected that portion of it which related to the adventures of Sir Kenneth, the Knight of the Leopard, as the subject of his drama. It will probably best enable our readers to get as far as possible a clear idea of the present work, if we give an outline of the plot, noticing at the same time, as we proceed, the more salient features of the music.

Those who are familiar with Balfe's style—and what amateur is not so, to a greater or less extent?—will not need to be told that its great characteristic is *melody*—not always particularly striking or original, but always pleasing and flowing, frequently also “ear-catching” and thoroughly attractive. Few men understood better than he how to hit the taste of the public. And though, on the whole, the present can hardly, perhaps, be considered one of the best of his works, it yet contains pieces, as will be seen presently, fully worthy of his reputation; pieces which are exactly “not too good to be popular,” and which, though they may fail to satisfy a highly critical taste, may not improbably be a most valuable property for the publishers.

Instead of a regularly-developed overture, the opera opens with a rather short orchestral prelude, commencing with a short *fanfare*, and founded, according to a well-established precedent, on themes subsequently met with in the course of the work. The first of these is Richard's prayer, “Monarch supreme,” in the second act, while the following *allegro* is the subject of the immediately succeeding solo and chorus “On, valiant Squires.” The opening scene of the first act shows us an Arab encampment on the shores of the Dead Sea, and the first number is a chorus of Arabs, “Soldiers of Araby,” which, though melodious, is more remarkable for truth of characterisation and for a happily imparted barbaric tone, than for intrinsic musical beauty. The Emir and Sir Kenneth, who have lately been engaged in combat, enter; the former has undertaken to conduct his late foe to the cave of the hermit of Engaddi. Their conversation turns on the subject of female beauty, and a duet, “Golden love-locks floating,” follows, in which each singer extols the merits of his countrywomen. This duet is pretty and tuneful, but on the whole somewhat commonplace. The scene then changes to the chapel at Engaddi. Edith enters, and after a rather long orchestral introduction, sings a scena, according to the fashion of *prime donne* in general. The slow movement, “Solemnly, softly, cometh the nightfall,” which follows the introductory recitative, is in Balfe's best manner: it is a very graceful and thoroughly pleasing, if not highly original, melody. After another recitative, a second verse of the melody follows, now given a semitone higher—in E flat instead of D—and with a more elaborated accompaniment. A characteristic interlude then introduces the dwarf Nectabanus, who summons Edith to the Queen's presence, and announces the arrival of the Knight of the Leopard, as an envoy from the crusading princes. In an animated *allegro* Edith expresses her joy, and departs, leaving Nectabanus alone. The dwarf in a recitative and air, “I love the sky when no bright stars shine,” gives vent to his spite against humanity in general

and beauty in particular. This piece is one of the best in the opera, and though likely to be less popular than many numbers not equal to it in musical merit, bears good testimony to the dramatic capacity and power of individualising character of the composer. The following scene, “Salve Regina”—in which a procession of nuns, among whom are Edith and the Queen, enters the chapel into which Sir Kenneth has been conducted by the dwarf—is a well-treated and effective number, the hymn being from time to time interrupted by the ejaculations of Edith and Sir Kenneth, who recognise each other. The musical value of this piece is far higher than that of some of its predecessors, the themes being well chosen and happily contrasted. As the procession quits the chapel, Edith drops a rose at her lover's feet, which he picks up and apostrophises in the song, “Flow'ret I kiss thee,” which concludes the first act. This song will probably be one of the most popular pieces in the opera; its simple theme is one of Balfe's most “Balfish” melodies, and the harmony, without being over-elaborated, is more interesting than is frequently the case in songs of this type. It would be worth the publishers' while to issue a transposed edition of this song, the voice-part of which lies rather high; as the amateur tenors who would doubtless wish to add it to their repertoire would probably dread the high B flats which are met with two or three times in the course of the music.

The first scene of the second act shows us the tent of King Richard, who in a long recitative and air sings of his affection for his queen. His song, “Oh, who shall sing the rapture,” is broad and effective, but by no means very new, and somewhat commonplace. The King then summons Sir Kenneth to his presence, and warns him against aspiring to the hand of Edith. Their conversation is interrupted by the arrival of De Vaux, who announces that the Duke of Austria has torn down the English banner from St. George's Mount, and planted his own in its place. After a short terzetto, the King and the two knights depart to avenge the insult; and the scene changes to the mount itself. The Duke of Austria is planting his banner amidst the approving shouts of his own soldiers, and the menaces of the English and French troops. A short, vigorous, but again not very original triple chorus presents this scene in music. Richard, accompanied by Sir Kenneth and De Vaux, arrives with a flourish of trumpets, and asks “Who hath done this?” On the Duke of Austria replying “'Twas I!” Richard tears down and tramples under foot the Austrian flag. The King of France arrives to mediate between the disputants, and Richard declares his intention of marching on the morrow against the infidels. Meanwhile he gives Sir Kenneth charge to watch over the English banner. A chorus, chiefly in unison, “Lead us on, Lion-Heart,” expresses the enthusiasm of the troops. The following number, Richard's prayer, “Monarch supreme,” and the *tempo di marcia* to which it leads, “On, valiant Squires,” have been already anticipated in the prelude which commences the work. This movement is full of spirit, pleasing and taking in its themes, but again, like much of the present work, of no remarkable novelty. Sir Kenneth, left alone, sings a very melodious air, “On balmy wing of night-breeze.” The accompaniment to the recitative which introduces this song is for a solo viola, and can hardly fail to have been suggested by Meyerbeer's similar employment of the same instrument in Raoul's romance in the first act of the *Huguenots*. Nectabanus enters, and in a long and well-written scene we see his endeavours to lure the knight from his post, in which he ultimately succeeds. The scene is again changed to the Queen's tent, and after a pretty chorus for the ladies in waiting, a ballad sung by the Queen, and a romance, “The Ladye Eveline,” sung by Edith, the latter of which is the more interesting, Edith learns that, by a trick, her lover has been seduced from his duty. Sir Kenneth enters, and the

Queen hurries to Richard to intercede for him and avert the consequences of her ill-timed jest. After a somewhat long but effective duet between the lovers, the King enters, and, learning that the banner of England has been cut down, is about to strike the traitor dead, when Edith and the Queen rush in and interpose. The finale of the second act, which immediately follows, is somewhat conventional both in form and treatment. It brings the act to an effective conclusion, but presents no features calling for special notice.

The third act must be briefly dismissed. After an orchestral prelude founded on the subject of Richard's song, which opens the second act, the monarch is discovered in his tent, reading letters from England. From these he learns that the Knight of the Leopard is no other than David, Prince of Scotland, in disguise. He regrets his banishment, and expresses a wish to see him again; whereupon his attendant De Vaux informs him that his wish may be at once gratified, as “the Nubian slave who but this morn did save thee from the assassin's blade, was Sir Kenneth, Knight of Scotland.” The King orders him to be at once summoned to his presence. The whole of this scene is in the form of free recitative, with more or less elaborate accompaniment. Edith and the Queen then enter, and beg permission for the former to retire to a convent, but Richard puts them off till the morrow. The scene then changes to the great pavilion. A grand procession of nobles and warriors enters to the sound of a military march, which is followed by a tuneful but somewhat common-place chorus, “A song to merrie England.” Richard arrives, gives orders to call to his presence the valiant minstrel knight whom he delights to honour, and from without is heard the sound of Sir Kenneth's song in the first act, “Flow'ret I kiss thee.” Edith recognises the music. Sir Kenneth is brought in, receives due acknowledgment of his rank, and of course is rewarded with the hand of Edith, who expresses her joy in a brilliant *rondo finale*, “Radiant splendours,” after which the military march, now sung as a full chorus, “Homeward yon blue water flows,” concludes the opera.

It cannot be said that *The Knight of the Leopard* will as a whole add much to its composer's reputation. It contains little the like of which is not to be found in his other works; but it is, though often common-place, always tuneful, and seldom if ever dry. Some of the separate pieces, especially the “flower” song, the “Ladye Eveline” romance, and the song “Radiant splendours,” are likely to keep their place with other of Balfe's compositions in the programmes of miscellaneous concerts; but some of the best music in the work is just that which will the least bear separation from the context. It is an English rather than an Italian opera; and for that reason we have in our notice given the English names of the pieces throughout.

One line must suffice to speak of the performance; for the readers of the ACADEMY will probably be far more interested to know what the music is like than how the various singers acquitted themselves. The part of Edith Plantagenet was given to perfection, both as regards singing and acting, by Mdme. Nilsson. The parts of the Queen, Sir Kenneth, and King Richard were effectively rendered by Mdle. Marie Roze, and Signori Campanini and Rota. Signor Catalani did full justice to the character of Nectabanus, and the less important parts were taken by Signori Campobello, Costa, Casaboni, and Rinaldini. The *mise-en-scène* of the opera was gorgeous, and the applause of a crowded house enthusiastic.

EBENEZER PROUT.

THE fifth summer concert of the present season at the Crystal Palace took place last Saturday, the programme on that occasion being devoted to the illustration of the Italian school of music. As might reasonably be expected, the vocal music was more prominent than the instrumental, though the latter was by no means destitute of interest.

Foremost in importance in this department was the revival of one of old Corelli's "Concerti grossi," the graceful and melodious strains of which received full justice from the strings of Mr. Manns's orchestra. Two specimens of Rossini's instrumental music were given—the well-known and popular overture to *La Gazza Ladra*, and the less known, but perhaps even more charming ballet-air "Passo a sei" from the first act of *Guillaume Tell*. The other orchestral piece was Cherubini's overture to *Anacreon*; but it is an open question whether Cherubini, though Italian by birth, ought not rather to have been classed among French composers, as all his chief operas were written for and produced at Paris. The instrumentalist was Signor Papini, the Italian violinist, whose recent performances at the Musical Union have shown him to be an artist of the highest order. He exhibited his powers in a concerto of his own; but his fine tone, perfect execution, and impassioned delivery would probably have been heard to even greater advantage in a work by one of the great masters. The concertos of Beethoven, Mendelssohn, or Spohr, were, however, of course inadmissible at an Italian concert. The Crystal Palace choir sang a motett by Palestrina, "O Saviour of the world," and Festa's well-known madrigal "Down in a flow'ry vale," besides taking part in the prison scene from the *Trovatore*. The solo vocal music, which consisted entirely of pieces from the operas of Bellini, Rossini, Donizetti, and Verdi was rendered by Mme. Miliano, Mlle. Singelli, and Signori Fancelli, Galassi, and Borella.

Owing to the increasing pressure upon our space, our notes of musical events must in the majority of cases be confined to a mere record of facts. We can, therefore, only enumerate the chief items of the excellent Philharmonic concert last Monday. These were the unfinished B minor symphony of Schubert and the "Pastoral" of Beethoven, Mendelssohn's Violin Concerto, played to perfection by Mme. Norman-Neruda, Rheinberger's very interesting and clever overture to the *Taming of the Shrew* (for the first time in England), and the overture to *Oberon*. It is only due to the band and its conductor, Mr. Cusins, to add that a marked improvement has been perceptible in the finish of the performances since the earlier concerts of the season.

At the Albert Hall, on Wednesday last, a new cantata entitled *Supplication and Praise*, by Dr. Sloman, was produced. The work contains some clever part-writing, which does credit to its composer's scholarship. It is, however, like so much new music, not remarkable for any great originality or individuality of style.

MDLLE. KREBS's second recital, on Thursday week last, was by no means inferior to the preceding one. Among the chief pieces given were Beethoven's Sonata in D minor, Op. 31, No. 2, Bach's Italian Concerto, and Schumann's seldom heard "Toccata," Op. 7. The whole programme was, however, so well selected, and so admirably performed, as to render it almost impossible to select any pieces for special praise.

Nearly the same may be said of Mme. Essipoff's second recital, last Saturday, with this difference—that this lady seems to us to be pre-eminently fine in Chopin's music. Such at least was the impression produced on us after hearing her splendid rendering of his great Nocturne in C minor, and Berceuse. To Mme. Essipoff's "reading" of Schumann's "Carnaval" some might perhaps take exceptions, but a certain amount of licence must always be granted to a great artist, and the more pronounced his (or her) individuality, the larger the allowance which should be made for differences of reading. Among the smaller pieces which Mme. Essipoff played on this occasion, special mention should be made of a charming little Etude, "Papillons," by her husband, Herr Leschetizky, and of an Intermezzo by Dr. Hans von Bülow.

MR. FREDERICK ARCHER's annual morning concert took place on Wednesday afternoon at

Hanover Square Rooms. Among the most important pieces of a long and varied selection were Bennett's Sestett for piano and strings; Mr. Lindsay Sloper's "Double Duet" for four performers on two pianos, on themes by Sir Julius Benedict; and the Chevalier de Kontski's duet for two pianos on the "Huguenots."

THE rehearsal for the Handel Festival took place yesterday at the Crystal Palace; and the Festival itself will be held during the coming week. Rather vague notions respecting it seem to prevail on the Continent, if we may judge from a reference to it in the last number of the *Musikalisches Wochenblatt*, in which it is stated that the *Messiah* is to be performed at Sydenham with from eight to ten thousand singers!

WE learn, on what we believe to be trustworthy authority, that the committee for the next Birmingham Musical Festival, which will take place in 1876, have resolved to invite Johannes Brahms to write a large vocal work for them, to be produced on that occasion.

The *Débats* of the 14th inst. contains a long notice of Verdi's "Requiem," which has just been produced in Paris, from the able pen of M. Rey, the musical critic of that journal. While on the whole highly laudatory, the notice states that the Requiem "is much more a dramatic than a religious work." He says, "it is chiefly in the character and form of the melody that M. Verdi in his 'Requiem' has freed himself, I will not say from a rule, but from a custom, to which composers whom the imposing splendours of the Catholic service truly inspire will always return." In its general style he compares it with the master's most recent opera *Aida*, of which also it offers occasional reminiscences.

MDME. SCHUMANN, who, as our readers will remember, was prevented from visiting England this season by a severe attack of rheumatism, is at present taking the baths at Teplitz, with the view of obtaining relief from her malady.

THE Norwegian Storthing has made a liberal grant of money to the two young composers Svendsen and Grieg, to enable them to give their undivided attention to artistic production.

LETTERS from Vienna announce that the new "Komische Oper" in that city, opened in January last, was closed on June 1. The speculation was unsuccessful, because the first-rate artists who were engaged, such as the *prima donna* Minnie Hauck, and the celebrated *buffo*, Gustav Hölzel, received such high salaries that the management, although the house was filled every night, could not afford them. The last performance was that of Leo Delibes' opera *Der König hat's gesagt* (*Le Roi l'a dit*), the only "great hit" made in the theatre during the whole season.

POSTSCRIPT.

AMONG the Sessional Papers issued this week we note three of considerable scientific interest. The first contains copies of official correspondence on the Organisation of a Meteorological Department in India, together with the report of the committee of the Royal Society; the second is the report of Professor Tyndall to the Trinity House, upon recent experiments with regard to fog signals, conducted at the South Foreland during the past and present years—a most valuable contribution to the study of the propagation of sound, which would require a lengthy notice in order that any just notion might be conveyed of it. The third paper is described as a copy of "Further Correspondence relative to Proposals to substitute Mineral Oils for Colza Oil in Lighthouses."

MR. FOSTER proposes to publish by subscription, in two volumes folio, price three guineas each, the *Pedigrees of the Historical Families of Lincolnshire*, as compiled by the late Lord Monson and Mr. Arthur Staunton Larken. The prospectus

states that the collection of these pedigrees occupied the compilers for many years, and, in addition to the Visitation entries of 1502, 1564, 1592, 1634, and 1666, they include the majority of the existing county families; they have been elaborately worked up from inquiries *post mortem*, wills, monumental inscriptions, parish registers, and other documents, public and private. As the history of Lincolnshire still remains unwritten, this collection will doubtless be a valuable acquisition to all who are interested in the county, and will go far towards forming a basis for the historian of the future.

MR. WENTWORTH WEBSTER writes from St. Jean de Luz:—

"Seeing the review of the Gipsy works in your present number leads me to ask whether the curious fact of the Gipsies so quickly coalescing with the Basques has been accounted for. Both here (St. Jean de Luz and Ciboure) and at St. Palais they have totally forgotten their own language and adopted Basque, though old people remember to have heard them speaking it, and mention a word or two. The Basques call them 'Cascarrotac.' They are now all Roman Catholics, and freely intermarry with the rest of the population. When some Hungarian Gipsies have passed through on their way to and from Spain, the 'Cascarrotac' have been quite unable to understand them. There are still some slight differences in habits and *physique* between them and the rest of the population; but these are fast being obliterated by successive mixtures. Occasionally curious cases of 'atavism' seem to occur."

AT the anniversary meeting of the Numismatic Society, on Thursday, June 18, the annual report for the year 1873-4 was read, and was followed by obituary notices of two members of the society who had died during the year—Mr. J. Yonge Akerman, and Mr. J. S. Wyon, late Engraver of the Royal Seals. The officers and Council for the following year were elected:—President, John Evans, F.R.S., P.G.S., &c. Vice-Presidents—the Right Hon. the Earl of Enniskillen; W. S. W. Vaux, F.R.S. Treasurer, J. F. Neck. Secretaries—Herbert A. Grueber; Barclay V. Head. Foreign Secretary, Percy Gardner, M.A. Librarian, W. Blades. Members of Council—Rev. Professor Churchill Babington; Dr. Birch; Colonel Seton Guthrie, R.E.; Major Hay, H.E.I.C.S.; H. Henfrey; Charles F. Keary, M.A.; Rev. S. S. Lewis, M.A.; Stanley Lane Poole; Samuel Sharpe, F.S.A.; John Williams, F.S.A.

SATURDAY, JUNE 27, 1874.

It is particularly requested that all letters respecting subscriptions, the delivery of copies, and other business matters, be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Some Leading Principles of Political Economy Newly Expounded. By J. E. Cairnes, M.A., Emeritus Professor of Political Economy in University College. (London: Macmillan & Co, 1874.)

The English Peasantry. By George Heath. (London: F. Warne & Co., 1874.)

THESE are books of a very different order, the first being a profound theoretical treatise by a distinguished professor of political economy; the second a plain narrative of facts, appropriately dedicated to Canon Girdlestone, as being a chapter in the recent history of the English agricultural labourer. The most important subject, nevertheless, in Mr. Cairnes's book is wages; and Mr Heath's narrative—which we cannot review separately, but which well deserves the attention of readers interested either in the agricultural labourer's question, or in the more general one of wages—is a repertory of material facts bearing on the subject in relation to some of the principal doctrines for which Mr. Cairnes contends.

Any new work by Mr. Cairnes would be sure of a *succès d'estime*, but the present is one the importance of which the economist most opposed to some of the principles it expounds with so much force, clearness, and skill, will not call in question. Its very importance, on the other hand, the high reputation of its author, and the consummate literary art it displays, impose on a reviewer the duty of sifting it closely. Mr. Cairnes himself sets an example of independent criticism. Thus he speaks of Mr. Mill's doctrine of cost of production as

“radically unsound, confounding things in their own nature distinct and even antithetical, setting in an essentially false light the incidents of production and exchange, and leading to practical errors of a serious kind, not merely with regard to value, but also with regard to some other important doctrines of the science.”

As we, for our own part, think not a few of Mr. Cairnes's own positions, including his doctrine of the relation of cost of production to value, untenable, we must claim for ourselves like independence of judgment and freedom of speech. Mr. Cairnes, we may observe, over-estimates sometimes the amount of authority opposed to his own views, sometimes the amount on their side. In the case just referred to, he too hastily assumes that the view he dissents from has “the general concurrence of economists.” The English market for economic publications is extremely limited, the works on the subject are necessarily few, but it is notorious that various doctrines to be met with in the English text-books have often been questioned in lectures, articles, discussions, and private conversation; and that the general concurrence even of English economists—of whom alone English economists

are apt to take account—ought not to be assumed from the agreement of those books. In the second place, the definition of cost of production which Mr. Cairnes puts forward, had, in fact, been set forth in very similar terms in a treatise which has gone through many editions. Mr. Senior, criticising Malthus for terming profit a part of the cost of production, says, “Want of the term abstinence has led Mr. Malthus into inaccuracy . . . an inaccuracy precisely similar to that committed by those who term wages a part of the cost of production.” Mr. Senior proceeds to define cost of production as “the sum of the labour and abstinence necessary to production.” Mr. Senior's analysis is, indeed, defective in omitting the element of risk, but that defect is beside the question, and in respect to it we may observe that Mr. Cairnes too narrowly limits it, in the case of the labourer, to risk to mental and bodily faculties. The labourer often shares the pecuniary risks of the capitalist's enterprise; he runs the risk of being thrown out of work and wages at a critical time; and this is only one of a number of facts inconsistent with the assumption of an equality of wages, even within the limits which Mr. Cairnes sets to it.

The doctrine of cost of production involves the whole theory of wages and profit; and an immense superstructure which has been built on what Mr. Cairnes would call the orthodox theory, must stand or fall with that theory. The subject may be conveniently approached by an examination of the doctrine of “the Wages Fund” and an “average rate of wages,” for which Mr. Cairnes contends. An instance has just been noticed of an overestimate, on his part, of the amount of difference between his own views and those of other economists: we here meet with one of an overestimate of the amount of support from authority which Mr. Cairnes is entitled to claim for his own view. He terms his own side of the question with respect to the Wages Fund, “the orthodox side.” If orthodoxy in economics is to be determined by authority, some weight surely is to be attached to continental authority. And in Germany, as Dr. Gustav Cohn has lately pointed out, the doctrine of a Wages Fund was controverted more than fifty years ago, and has been repeatedly assailed since; nor does it now form, we believe we may affirm, an article of the creed of any scientific school of German economists. It is condemned by M. Emile de Laveleye, of Belgium, to whom Mr. Cairnes will not deny a place in the front rank of European economists. French economists have never been polled on the question, but it is at least certain that the notion that there is an aggregate national wages fund, the proportion of which to the entire number of labourers determines the general rate of wages, is incompatible with the exposition which M. Léonce de Lavegue—who, it is needless to say, combines the highest theoretical attainments with the most extensive knowledge of the actual economic phenomena of his own country—has given of the diversity of the rates of wages and the causes determining them, in different parts of France. In England the doctrine was, after mature consideration, abandoned by Mr. Mill; it has been vigor-

ously assailed by Mr. Thornton; it is repudiated by Mr. Jevons; and among other economists in this country, the present reviewer long ago combated it. On the whole, we believe that the chief weight of European authority is against the doctrine, and that it is a heresy, if that constitutes one. But the terms orthodoxy and heresy are singularly inappropriate in philosophical discussions. What philosophy seeks is reason and truth, not authority; and we will briefly state some of the grounds of reason and fact on which we take our stand in maintaining that an aggregate wages fund and an average rate of wages are mere fictions—fictions which have done much harm, both theoretically and practically, by hiding the real rates of wages, the real causes which govern them, and the real sources from which wages proceed. In every country in Europe, the rates of wages even in the same occupation vary from place to place; in other words, the same amount of labour and sacrifice of the same kind is differently remunerated in different localities. The Devonshire, Somersetshire or Dorsetshire labourer has been earning for the last fifty years less than half what the same man might have earned in Northumberland; the pay of Belgian farm labour is three times higher in the valley of the Mense than in the Campine, and twice as high as in Flanders; it varies, likewise, prodigiously in Germany, even in adjoining districts. Whence these diversities? The reason, obviously, is that distinct and dissimilar conditions determine wages in different parts of each country. Mr. Cairnes urges:—

“A rise of wages, let us suppose, occurs in the coal trade—does any one suppose that this could continue without affecting wages, not merely in other mining industries in full competition with coal mining, but in industries the most remote from coal mining, industries alike higher and lower in the industrial scale? Most undoubtedly it could not.”

We answer, most undoubtedly it could, and actually did. Wages rose continuously for a century in mining and other industries in some counties in England, while in others the earnings of the agricultural labourer remained stationary throughout the whole period. In 1850, Mr. Caird found the rate of agricultural wages in one northern parish 16s. a week, in another parish in the south only 6s. a week. In the former parish, mines and manufactures competed with farming for labour; in the latter, the one employer was a farmer holding 5,000 acres. Would it be reasonable to say there was an average rate in the two parishes of 11s. a week, resulting from the ratio of the aggregate wages fund to the number of labourers in both? What share had the southern labourer in the funds from which his fellow in the north earned his 16s. a week? In like manner, the funds expended in wages in the Rhine Province no more govern the price of labour in Pomerania and Posen than in Cornwall or Kent. A farm labourer in Flanders earns 1 fr. 50 c. a day, an inferior labourer in another part of Belgium may earn 3 fr. 50 c. and upwards. Why? Because the Fleming no more shares in the funds which afford such high wages around Charleroi and Liège, than a provin-

cial journalist does in the funds from which the writers of the *Times* are remunerated. Moreover, to speak of the ratio of an aggregate wages fund to the number of labourers as determining wages in each country surely implies that the sum expendible in wages at any given time is a fixed quantity; and, accordingly, M. de Laveleye remarks that one of many facts which give a practical refutation to the doctrine is that wages have recently risen in some parts of Belgium at the expense of rent. The demand for labour in manufactures on the one hand, and the novel attitude of the Belgian farm labourer on the other, have compelled farmers in certain districts to raise wages to a point at which farming has become a losing business; rents, therefore, are falling. It was seriously urged against trade-unions and combinations of labourers in England a few years ago by some advocates of the doctrine of the wages fund, that wages could not be raised by combination in one trade or locality without a proportionate fall of wages elsewhere, there being only a certain aggregate fund to be distributed. Mr. Heath's statement, however, is incontrovertible that the mere report of the formation of an agricultural labourers' union in Warwickshire raised wages immediately in several neighbouring counties, and it will hardly be contended that there was a corresponding fall in other counties.

It is evident that the result has been mistaken for the cause; that the aggregate amount of wages is nothing but the sum of the particular amounts in all particular cases taken together; and that it would be as rational to say that the income of each individual in the United Kingdom depends on the proportion of the total national income to the number of individuals, as to say that the wages of each labourer in every place and in every occupation depend on the ratio of the sum total of wages to the total number of labourers. The statistician may find some interest in calculating the average rate resulting from the ratio of the aggregate amount of wages, if it could be ascertained, to the number of labourers in the kingdom; but the economist deludes himself and misleads others by representing this as the problem of wages. If farm wages be 10s. a week in Devonshire and 20s. in Northumberland, to say that the average rate is 15s. a week is to speak of a rate which has no existence in either, and to withdraw attention from the causes of the real rates in both. In every country, instead of an average or common rate of wages, there is a great number of different rates, and the real problem is, what are the causes which produce these different rates? Hence we are driven to conclude that Mr. Cairnes is not "justified," to use his own words, "in generalising the various facts of wages into a single conception, and in discussing 'general' or 'average wages.'"

At this point we are brought to enquire whether there is any better reason for maintaining the existence of an average rate of profit. The doctrine of average profit is closely connected in Mr. Cairnes's exposition with that of average wages. While contending, erroneously as we have shown, for an equality of wages throughout all similar

occupations in the same country, he admits that working classes of very different degrees of skill do not compete, and may be paid at different rates for equal sacrifice and exertion. But, he adds,

"though labourers in certain departments of industry are practically cut off from competition with labourers in other departments, the competition of capitalists is effective over the whole field. The communication between the different sections of industrial life, which is not kept open by the movements of labour, is effectually maintained by the action of capital constantly moving towards the more profitable employments. In this way our entire industrial organisation becomes a connected system, any change occurring in any part of which will extend itself to others, and entail complementary changes."

In Mr. Cairnes's view, if wages were below par in any trade or locality, although the labourers there might not be able to migrate, a movement of capital seeking cheap labour would at once set in. It might almost be a sufficient refutation of this doctrine, in relation both to wages and to profit, to point out that no migration of capital has equalised the wages of agricultural labourers in any country in Europe. What migration there has been—and it has been altogether inadequate to produce an approach to equality of wages—has been almost altogether a migration of labour. Moreover, if in a single occupation so simple as that of agricultural labour there has been no such effective competition as Mr. Cairnes assumes, there seems some antecedent reason for suspecting error in the assumption of such an effective competition among capitalists as to equalise the rates of profit in all the countless employments of capital. There is something like a circular movement in Mr. Cairnes's reasoning on this subject. He first argues:—

"Each competitor, aiming at the largest reward in return for his sacrifices, will be drawn towards the occupations which happen at the time to be the best remunerated; while he will equally be repelled from those in which the remuneration is below the actual level. The supply of products proceeding from the better paid employments will thus be increased, and that from the less remunerative reduced, until supply, acting on price, corrects the inequality, and brings remuneration into proportion with the sacrifices undergone."

But afterwards we read:—

"The one and sufficient test of the existence of an effective industrial competition, is the correspondence of remuneration with the sacrifices undergone—a substantial equality, that is to say, making allowance for the different circumstances of different industries, of profits and wages. Such a test applied to domestic transactions shows the existence of a very large amount of effective industrial competition throughout the various industries carried on within the limits of a single country. The competition of different capitals within such limits may be said to be universally effective."

Is not this very like arguing that the equality of profits is proved by the fact that there is an effective competition of capital, and that the equality of profits proves the fact of an effective competition? Nor is this the only seeming flaw in Mr. Cairnes's logic. In proof of the equalisation of profits, he urges that capital deserts or avoids occupations which are known to be comparatively unremunerative; while if large profits are known to be realised in any in-

vestment, there is a flow of capital towards it. Hence it is inferred that capital finds it level like water. But surely the movement of capital from losing to highly profitable trades proves only a great inequality of profits. There is, in like manner, a considerable emigration of labourers from Europe to America: does that prove that wages are equalised over the two continents? Let Mr. Cairnes himself answer:—

"Great as has been the emigration from Europe to the United States, it may be doubted if any appreciable effect has been produced on the rates of wages in the latter country. Throughout the Union, wages remain in all occupations very considerably higher than in the corresponding occupations in this country."

Elsewhere he estimates American wages at twice the English, and four times the German rate. The emigration of labour, thus, is neither sign nor cause of an equality of wages; it is, on the contrary, consequence and proof of their inequality; and the migration of capital from losing or unprofitable to promising businesses, in like manner, only lands those who refer it in evidence of the equalisation of profits in an *ignoratio elenchi*. Mr. Cairnes, it seems clear, has not taken into consideration the main objections to the doctrine he espouses. The only objections he notices are the difficulty of transferring buildings, plant, and material from one use to another, and of learning a new branch of business. The fact is, that there are, in the first place, no means whatever of knowing the profits and prospects of all the occupations and investments of capital. No capitalist knows so much as the names, or even the number of the trades in the London Directory, only a part of the trades of the kingdom; and their number and names are yearly increasing. If, again, there were any statistics showing the actual gains of the different trades, they would show that the profits of the individual members of each trade vary immensely.

The business of insurance used to be thought one in which there was a certain general rate of profit. But a few years ago the subject was investigated by Mr. Black, and also in the *Economist*, and the result arrived at was the fact of "extremes of success and disaster in the experience of companies still underwriting." Mr. Cairnes's reasoning assumes that the profits of every business are well known; but as they vary greatly with different companies and different individuals, the assumption implies that individual profits are known. If they were, it would be seen that to speak of the average profits, even of a single business, is idle. Moreover, even if the past profits of every individual in every trade were known, it would be a serious error on the part of capitalists, though one which they often commit, to judge of the future from the past. The changes in production and the conditions of trades, in international competition, and in prices, the effects of speculation, fluctuations of credit, and commercial crises, of scarce and abundant seasons, wars and other political events, new discoveries and inventions, would upset all these calculations. Curiously enough, Mr. Cairnes himself has maintained that the new gold mines introduced a disturbing element which

will probably affect profits for thirty or forty years. Ricardo admitted that at the very time he was building a pile of theory on the assumption of an equality of profits, the return of peace had made them in fact very unequal. Had he looked back for a quarter of a century, he would have found abundant proof that they had been very unequal throughout the long war; and had he been able to foresee the immediate future, he would have learned from the crisis of 1825, which Mr. Tooke so well described, how blindly mercantile men often reason, how far they are from possessing the knowledge, sagacity and prescience his theory supposed. So far, indeed, are men in business from knowing the conditions on which future prices and profits depend, that they are often ignorant, after the event, of the causes of their own past profits and losses. Not a single farmer or corn merchant, no witness whatever before the parliamentary committees save himself, Mr. Tooke states, dreamt of referring the high prices of corn in the early part of this century to the succession of bad harvests. It is not even true that losing businesses are always abandoned. Hope springs eternal in the human breast, and it is an old saying that all the mines in Cornwall are worked at a loss—that is to say, the average result is a balance on the wrong side. Mr. Mill, indeed, has reduced the supposed equality to one not of actual profits, but of expectations of profit. There is not, however, even this: no capitalist ever attempts to survey the whole field, or to estimate the probable relative gains of every investment.

The doctrine of average profit, like that of average wages, thus falls to the ground, and with it falls the superstructure built on it, including Mr. Cairnes's doctrine of value. "The indispensable condition," he states, "to the action of cost of production is the existence of an effective competition amongst those engaged in industrial pursuits"—that is to say, a competition which equalises profits; and we have seen that no such competition is possible. If we are, in economic theory, to exhaust space and time of their contents, and to suppose a vacuum in which no obstacles to the movements of labour and capital in pursuit of gain exist within the limits of each country, so that wages and profits are equalised, why not apply the same supposition to international trade and international values? We might, in like manner, theorise about wages, profit, prices, and rent at the bottom of the ocean on the supposition of the absence of water. The truth is—and it is a truth which Mr. Cairnes has missed, though he has made an important step towards it—that the principle regulating domestic as well as international values is not cost of production, but "the equation of demand," or "demand and supply;" though the formula is one which requires much interpretation, and by no means contains in its very terms the full explanation of values and prices which a good many people suppose.

But more than the superstructure of economic theory built on the doctrine of cost of production falls to the ground along with it. The method of deduction from assumption, conjecture, and premature generalisation falls too. Mr.

Cairnes speaks in his preface of certain "assumptions respecting human character and the physical conditions of external nature," as constituting "the ultimate premisses of economic science;" and of "the method of combined deduction and verification by comparison with facts," as "the only fruitful or, indeed, possible method of economic inquiry." But is a theorist likely to be very searching in his verification of assumptions on which he has built his whole science and his own reputation? Have the economists of the deductive school ever verified their doctrines respecting the equality of profits and of wages? If they are at liberty to set aside as "disturbing causes," all the obstacles to the pursuit of gain resulting from other principles of human nature, and from external circumstances, and to theorise respecting wages, profits, and prices *in vacuo*, what right have they to assume the existence of the love of gain itself in such an imaginary world? The only facts in human nature, we may add, which abstract political economy takes account of are far indeed from being ultimate facts, or from being susceptible of treatment in economic reasoning as simple, universal, and invariable principles. Self-interest and the desire of wealth are both names for a multitude of different passions, ideas, and aims, varying in different ages and countries, and with different classes and different individuals; and each having its own peculiar effects on the nature, production, and distribution of wealth.

The "principle of population," again, so far from being an ultimate fact in human nature from which general conclusions can be drawn, is a highly artificial and widely varying principle, inseparably interwoven with religious and moral ideas and historical causes. Its force in Bengal is the result mainly of a particular superstition; and, owing to causes which have never been probed to the bottom, its force varies greatly not only in neighbouring countries like England and France, but in different parts of the same country, Normandy and Brittany for example.

Our limits prevent our even alluding to many special questions of great interest raised by Mr. Cairnes, but we will take two or three examples from the chapter "On some Derivative Laws of Value." In the early stages of a nation's growth, tillage for the production of corn steadily gains ground on pasture; but Mr. Cairnes treats it as a "law of industrial progress" that in the later stages this process is reversed, and pasture constantly encroaches on tillage. We think we find here an instance of the economic error resulting from inattention to both continental phenomena and continental literature. Save in exceptional situations, the increasing supply of meat in Europe is obtained by stall feeding and tillage, not by the extension of pasture. As Professor Nasse states, the aridity of the climate and the character of the soil preclude pasture throughout the greater part of Germany. M. de Laveleye maintains that, by means of stall-feeding, Flanders, in spite of the poverty of its soil, supports more cattle to the acre than England. It is noticeable that both these distinguished economists point to one condition

unnoticed by Mr. Cairnes, which may in future, to some extent, counteract the causes hitherto operating so decisively in favour of tillage for the production of meat over most of the continent—namely, the rise in the price of labour. How far mechanical art, on the other hand, may neutralise this condition it is useless here to enquire; but M. de Laveleye makes the important observation, that even where a country like England, with exceptional advantages for pasture, imports a great part of its corn, the importing and exporting countries become virtually one economic region in which tillage is constantly advancing. Hence an enormous extension of tillage in the United States, for the supply both of its own population and that of Europe, is as certain as any fact in the economic future can be. Connected with the foregoing question is one respecting the price of corn, which, according to Mr. Cairnes, "at length, in the progress of society, reaches a point beyond which (unless so far as it is affected by changes in the value of money) it manifests no tendency to advance further." This point, in Mr. Cairnes's judgment, was already reached in England three centuries ago, if not, as he has no doubt, some centuries earlier; the reason he assigns being that, after a certain point, an advance in the price of corn reacts on our population and checks the demand. There are, however, several methods by which a nation may meet an advancing cost of corn—by a diminished consumption of animal food, for instance, or a diminished cost of manufactures. As a matter of fact, the labouring population of England has much diminished its use of animal food since the fifteenth century, while it clothes itself cheaper. The enormous prices of corn towards the close of the last, and during the early part of the present century, again, show how an advance in the price of bread may be met by privation. The whole population of the United States is now a meat-consuming one; but if Macaulay's prediction be fulfilled, at no very distant future an increased cost of corn will be met by relinquishing meat; and a part of the nation may possibly even fall back on potatoes, or some other cheap vegetable; so that the future price of corn can only be matter of speculation. The price of timber, it may be observed, has followed a different course on the Continent from that which Mr. Cairnes lays down for it. Its value, he says, "rises in general slowly, but never attains a very great elevation, reckoning from its height at starting." Professor Rau, however, has given the following prices of a given measure of the same wood in Würtemberg, in florins and kreuzers:—1690–1730, 57 kr.; 1748–1780, 2 fl. 14 kr.; 1790–1830, 8 fl. 22 kr. And Dr. Engel's statistics show that the price of wood in another part of Germany nearly quadrupled itself between 1830 and 1865.

While we dissent altogether from most of the fundamental propositions of Mr. Cairnes's book, from the economic method it follows, and from not a few of its inferences and speculations, we see much to admire in it. It abounds in valuable criticisms, such as that of Mr. Brassey's proposition that dear labour is the great obstacle to British trade, and of the argument of American protec-

tionists that the States with their high-priced labour cannot compete with the cheap labour of Europe.

T. E. CLIFFE LESLIE.

Fifty Protestant Ballads. By M. F. Tupper. (London: W. Ridgway, 1874.)

HISTORY relates that an American carter, celebrated even in America for his accomplished command of foul language, was one day driving a cart loaded with apples up a hill, when the back-board broke, and the apples rolled out. His friends gathered round, expecting to pass some pleasant and instructive moments. But the carter went silently to work at picking up the fruit. "I am not equal," he said, "to this occasion." In presence of Mr. Tupper's *Protestant Ballads* we too feel unequal to the occasion. Where is one to begin, and how are such golden opportunities to be employed? If we had kept pace with the Protestant literature of the day, and steadily read the *Rock*, that earnest journal which is opposed to everything beginning with an R, we should not now be so overcome with pleasure and amazement. We should have known that the Protestant heart of England still beat, and that Mr. Tupper still was the Tyrtæus of Evangelical religion. We may even, without profanity, call him the inspired bard, for, by his own confession, he seems to write in a sort of trance. "I have here printed," he says, "only fifty of my ballads, though conscious of having written many more." There is a dreamy vagueness about this expression, as if ballads flowed from Mr. Tupper's pen automatically, as twaddle does from that of a writing medium. Indeed, perhaps the only excuse for Mr. Tupper's unchristian hatred of a large section of his "dear old Church of England," and for his reckless grammar, is to be found in the hypothesis that he is only the medium of a few of the feebler spirits we hear so much about just now.

It would be absurd to criticise Mr. Tupper as if his ballads had literary merit or theological value. They are merely another proof of how curiously these Christians dissemble their love. The following are some of the epithets Mr. Tupper showers on his clerical opponents: "Antichrists," "tainted with Rinderpest," "bandits of the Babylonish Beast," "epicene Iscariots," "spawn of the Serpent." It is sad to think of the poor Beast, who has been so dearly loved by, and so often useful to, Evangelical preachers, suffering from Rinderpest in his old age. Epicene Iscariots too, are disagreeable people to have among us, and it will be a relief when they retire to

"Jerusalem the Golden,
Just such an Eden some Pacha might paint."

Whether pachas, as a rule, are painters—whether, if they were, they would choose Eden for a subject—what possible connexion there may be between Eden and Jerusalem, whether the Golden or not—are questions which people who read Mr. Tupper may perhaps be able to answer.

Mr. Tupper's charity may be appreciated after reading this quotation from the "Ritualist Directorium":—

"Your morals: no, you must not be found out
In things lay fools may make a fuss about.
And there's perpetual celebration too,
Perpetual license to begin anew."

It is difficult and painful for educated men and women to believe that this sort of stuff is read and believed in. Mr. Tupper's ballads are a war-cry from an obscure section of the fighters in the Armageddon of the *odium theologicum*. From this point of view there is something pathetic about the Protestant Ballads. They are the last utterances of Giant Protestant, that poor old warrior, who was so useful in his time, and who really should think of retiring into his cave, and setting a peaceful example to his old enemy, Giant Pope. A. LANG.

Calendar of State Papers and Manuscripts relating to English Affairs existing in the Archives and Collections of Venice, and in other Libraries of Northern Italy. Vol. V. 1534-1554. Edited by Rawdon Brown. Published by the authority of the Lords Commissioners of Her Majesty's Treasury, under the direction of the Master of the Rolls. (London: Longmans & Co. and Trübner & Co., Paternoster Row. Oxford and London: Parker & Co. Cambridge and London: Macmillan & Co. Edinburgh: A. & C. Black. Dublin: A. Thom. 1873.)

(First Notice.)

MR. RAWDON BROWN'S fifth volume is more difficult to treat in a short article than the preceding, if only on the ground that it runs over a period of time nearly three times as long, beginning with the concluding years of the reign of Henry VIII., and ending with the first and second year of Philip and Mary, as the period from July 25, 1554, to July 25, 1555, is statutorily called. All through the twenty years Venice maintains the character for diplomatic caution that the Republic earned by her conduct in the matter of the divorce from Catharine of Aragon. It was no doubt sufficiently embarrassing to steer a clear course through all the political and religious changes which characterise the reigns of Edward VI. and Mary, but Venice managed to pursue her course without offending either the Defender of the Faith, or the Emperor, or the Most Christian King.

However, the object of the publications in this series of volumes, issued under the direction of the Master of the Rolls, is not to illustrate the history of Venice or of any other foreign State, but to furnish supplementary matter to confirm, or, if need be, to correct, the impressions of English history derived from a study of such records as have been already published from home sources; and the present volume is quite as valuable in this respect as any that have preceded it.

We take as our first instance of the dovetailing of these Venetian documents into previously known papers which supply us with imperfect information on the subject of which they treat, the letters which allude to the hopes entertained at the commencement of Edward's reign of bringing back England to the Roman obedience. No notice has been taken of the part which Pole took in this matter by any of his biographers, excepting

a slight allusion to it by the Dean of Chichester, there not having been made public any authentic contemporary documents on the subject, excepting one letter in Querini's Collection.

It appears from Mr. Turnbull's foreign Calendar of this reign, that Edmund Harvel wrote to the Protector from Venice as early as March 7, cautioning him as to the project in which the Pope designed to make use of Pole. Harvel had lost no time, for only just two days before, as we learn from the Venetian Calendar, the Chiefs of the Ten wrote to their ambassador at Rome, saying that they will use their good offices as regards the Pope's request about the affairs of England. On June 27 following, the Chiefs of the Ten undertook that their ambassador in England should give the Court of Rome notice of the state of affairs in that country, with a view to its resuming its obedience to the Apostolic See. The hopelessness of effecting anything in this direction seems to have caused the matter to drop till the more favourable opportunity of the imposition of the new Book of Common Prayer in 1549 caused a renewal of the attempt. The Cardinal's long absence from his native country rendered him ignorant of the state of feeling amongst the people, who were willing enough to keep the old religion if only they could do so without submitting again to Papal domination. But the gradual introduction of Protestantism, by first altering the Missal in 1548, and now proposing a new worship to supersede the daily Mass, offered an opportunity which was not to be neglected. How far Pole was cognisant of the probability or instrumental towards the fact of the rising of the commons in 1549, does not appear. One of their stipulations was that the Cardinal should be restored to his native country, and should be placed on the Privy Council. But the two documents in our own Record Office which refer to this attempt are scarcely intelligible without the assistance we now derive from the Venetian Calendar. One of these papers has never been printed. The other, which is dated from Rome, April 6, 1549, appears in Tytler's *England under the Reigns of Edward VI. and Mary*. Tytler entirely mistook the nature of this communication, imagining it to refer to some arrangement to be made between the French king and the Emperor. It was, in fact, a letter commending to the Earl of Warwick the case of the reconciliation of England to Rome, about which he says he had sent two messengers to the Protector. Now Mr. Rawdon Brown has printed a letter from Pole to the Papal Nuncio in France, apparently alluding to this mission, which he conjecturally dates May 6. The probability seems to be that it should be dated a month earlier—our own Record Office supplies the information that Throgmorton and Holland were at Antwerp May 16, and on their way to Louvain—unless indeed this letter refers to a second mission a month later than the first. Pole certainly wrote again to the Protector on May 6, as appears by Somerset's answer to him, dated June 4, and alludes to a previous letter, which was, no doubt, an answer to this missive of April 6. The letter of June 4 is the unpublished one alluded to above, and is in itself interesting

as it seems to show that Somerset either really believed, or wished Pole to think he believed, that Pole might still be reclaimed. With this letter there was transmitted a copy of the newly-published Prayer Book, and the Protector writes as if he thought there was really a chance of inducing Pole to come home and conform to the new religion.

And here we light upon one of the most interesting documents in the whole volume. It is the reply of Pole to Somerset, dated September 7, and occupying twenty-six pages of the book. But, before attempting to give an account of this valuable paper, we may be permitted to express our regret at the brief notices which have been made in the Domestic Papers of the reigns of Edward and Mary. The ability with which this volume has been got up is unquestioned, but its contents present in one respect a marked contrast to the other volumes of Calendars in this series. The entries are, in fact, nothing more than a catalogue of dates and names of correspondents, with just the addition of two or three lines, hardly sufficient in some cases to identify the document. In the present instance Mr. Rawdon Brown is correct in saying that this letter is a reply to that of June 4, 1549, in our Record Office. But the entry in Mr. Lemon's volume would not enable any one to speak positively on this point. It is only after reading through Somerset's to Pole that we can assert certainly that it is so, the answer dealing with Somerset's allegations *seriatim*.

Like many of Pole's other letters, it is very long-winded, and we shall only trouble ourselves with the facts which he mentions. And first he contrasts Somerset's proud rejection of his offers of mediation with the gentle mode in which Henry VIII. had received his expression of disapproval of the divorce when tendered to him by his brother, Lord Montague. He then expresses the hope that the king will follow his father's example, and repair the injuries which had already been done to Pole; and here he reminds him of the mode in which in his first Parliament Henry VIII. had restored to Pole's mother, the Countess of Salisbury, the greater part of her revenues, on condition that she would signify her pardon for the death of her brother, the Earl of Warwick, who had been murdered by Henry VII., that king having on his deathbed repented of this and other acts of injustice, and commanding his son to do so. In a subsequent part of the letter Pole recurs to this subject, and mentions the grief of Catharine of Aragon at the recollection of the part her father Ferdinand had taken in Warwick's death by suggesting to Henry VII. that he did not like to give his daughter to a king who was not secure on his throne. He then recalls to Somerset's recollection how Henry VIII. had not shrunk from sending Dr. Wotton to Liège to confer with Pole, in order to bring him round to his side. It is plain from the Cardinal's whole tone and manner that he reckons on the disturbances at home as being likely to be taken advantage of by the Emperor to interfere with English affairs, but the writer solemnly avers that he had never in any way instigated the Emperor to invade England.

And here we must leave this interesting document in order to say a few words on this last assertion. We feel sure it may be implicitly relied on, and are glad to be able to quote the opinion of Mr. Rawdon Brown as to the character of Cardinal Pole. He says:—

"From the day Reginald Pole entered himself as a student at Padua in 1521, until his final departure from the Lake of Garda towards England in 1553, my belief is that he did more to maintain the repute of his country for high breeding, scholarship, integrity, and consistency than any other Englishman I ever heard of" (p. xi.).

This is the opinion which seems, as it were, extorted from the editor of the Venetian documents, and we cannot regret its appearance, however contrary it may seem to Lord Romilly's instructions to the editors of Calendars to confine their remarks to an explanation of their papers. Some such endorsement of the character given of him by an able diplomatist, his countryman and contemporary, who knew him well, was quite necessary. Sir John Mason says there was not a better English heart than Pole's.

It may not be known to many of our readers that a communication was made by the late Mr. Bergenroth on the documents relating to Cardinal Pole at Simancas, and was printed as an appendix to the Deputy Keeper's *Report on the Venetian Archives*, published in 1865. In the despatch alluded to by Mr. Bergenroth it is asserted that Pole made the acquaintance of Martín de Zornoza, the Spanish consul at Venice, and confided to him a plan which the consul represented to the Emperor as having for its object to dethrone Henry and place England at the mercy of the Emperor. We have always entertained a suspicion of the correctness of this description, knowing as we did Mr. Bergenroth's credulity and prejudices. It may be observed, however, that he writes from memory, and without having the ciphered despatch before him; and he himself admits that Pole is more guarded in his expressions than Zornoza. We need not insist on the fact that no such name as Zornoza appears in any of the archives at Venice. There is no necessity for proving that the letter is a forgery. We will take it for granted that it exists, and has perhaps been described correctly, or perhaps with some exaggeration, by its decipherers. The solution of Pole's conduct is perfectly easy, and perfectly consistent with the character for integrity which we have always believed in, and which Mr. Rawdon Brown so much insists on. Pole's friend, Contarini, informs the emperor on the contrary that "it is the intention of Pole to go to England, and to convert the king by peaceful means to the true religion." This project belongs to the years 1534 and 1535, but in the year 1537 an attempt was made to send Pole as papal legate to England, and Mr. Bergenroth referring to papers at Simancas, accuses the Pope Paul III. of deliberately intending to marry Pole to the Princess Mary, and to place them on the throne of England instead of Henry VIII., the Cardinal's hat being a mere blind to put people off their guard. We need not examine this charge as it affects the Pope. It

is sufficient that the Simancas papers do not appear to produce a particle of evidence of Pole's complicity with any such attempt. There is nothing whatever to show that Pole was not thoroughly English at heart, and intensely desirous to reduce England, by fair means if he could, to the obedience of the Apostolic See. And this is exactly the point which Pole proceeds to urge in the sequel of this letter to Somerset. He warns Somerset of what the Emperor might be induced to do, but distinctly denies the charge which Somerset had insinuated that he had ever solicited or instigated Charles to attack England. The papers at Simancas which refer to this transaction must be highly interesting. We fear, at the present rate of advance of the Spanish Calendars, we shall have to wait many years before they are available. Meanwhile, we suspend our judgment as to the allegation of Mr. Bergenroth, that among the other letters at Simancas there is one, a holograph, in which Pole offers himself as a husband to the Princess Mary.

NICHOLAS POCCOCK.

South by West, or Winter in the Rocky Mountains and Spring in Mexico. Edited, with a Preface, by the Rev. Charles Kingsley, F.L.S., F.G.S., Canon of Westminster. (W. Isbister & Co., 1874.)

THE authoress of this pleasant book has occupied fresh ground in her account of a new country on the eastern slope of the Rocky Mountains. Men have written about the Far West enough and more than enough; but no English lady, as far as I know, has given any description of it. A woman's point of view is so distinct: she sees what men see in such a different light, and observes and notes so many things which men overlook, that her description forms a necessary supplement, possessing all the attractions of novelty. And Mexico, too, where the writer sought fresh adventures after her winter in the Rocky Mountains, has been so little visited or written about since the close of the short episode of the Imperial tragedy, that the subject has regained its interest, and the solid information which the writer imparts with so little tediousness is really well-timed and acceptable. One great charm of the book is the simple and natural style in which it is written, and the genuine freshness and zest with which the traveller seeks out and describes all new aspects of nature and of society. More commendable and pleasing still, perhaps, is the absence of grumbling and fault-finding, and the freedom from that prejudice with regard to everything American, based upon imperfect knowledge and the conception of the 'conventional Yankee, which pervades and vitiates the judgment of most English people. Miss Kingsley has evidently the faculty of viewing things apart from this, fairly as they are, and I cannot help echoing the wish of the editor, that her just and kindly appreciation may serve to further the better understanding between the English and American peoples which seems to be growing so satisfactorily just now.

After a short visit to Niagara and places of interest in the Eastern States, the traveller turned her face westwards, and passed two-

thirds of the way across the Continent, over the Great Prairie to Denver, in Colorado. Denver is situated at the western extremity of the vast central plain, some fifteen miles from the foot of the Rocky Mountains, and is one of those wonderful cities which have sprung up so rapidly along new lines of railway in western America. In the beginning of 1870 the whistle of an engine had never been heard in Denver; early in 1872 five railways were running out of it, and its population had doubled in a single year. Seventy-six miles south of Denver, on a new line of railway in the course of construction from that city to El Paso del Norte on the frontier of Mexico, lies the young settlement of Colorado Springs. Here, on the eastern slope of the Rocky Mountains, the authoress spent the winter, part of the time in a dwelling the substantial character of which may be inferred from the fact that it was "ordered on Thursday and finished on Saturday"—a little wooden shanty on a bare level plateau, but in the midst of magnificent scenery, which afforded an endless field for exploration, attended with all the charm of new discovery, and supplied material for many happy and picturesque descriptions. Monument Park and the "Garden of the Gods," grassy valleys studded with huge pillars of sandstone of strange fantastic shape, burlesquing every form of animated nature; snowy mountains, of which Pike's Peak, 14,336 feet high, is by no means the loftiest; the virgin beauties of unknown glens, or deep cañons with lofty walls of bright coloured rocks, adorned with rich creepers and giant pines. But life in this grand wild country has its drawbacks, and the new comer had experience of them in various forms. Once, when sleeping alone in the solitary shanty, with nothing but a kitten and a revolver as companions, she was rudely awakened by awful sounds such as she had never heard before, breaking the stillness of the night:—

"Peal upon peal of demoniac laughter, mingled with shrieks and screams, seemed sweeping past the shanty—now loud, now softer, till they died away in the distance. I flew up, and with revolver across my knee listened in a perfect agony of terror; but the sound, whatever it was, had gone by, and by the time I had struck a match and found it was 4 a.m., I knew what it must be—a band of coyotes (prairie wolves) had come through town on a raid after stray sheep. And small blame to me if I was frightened; for many a stout Westerner has told me how, camping out on the plains in hourly expectation of an Indian attack, a band of coyotes have made every man spring to his feet with rifle or revolver cocked, thinking the wolfish chorus was an Indian war whoop."

The climate, again, although extremely bracing and healthy at this altitude of from 4,000 to 7,000 feet, shows great variations of temperature. In winter a hot bright sun in the daytime alternates with nights of bitter cold, when the thermometer is down sometimes 20° or 30° below zero. Yet so dry is the atmosphere that this is borne with comparatively little discomfort, and the cool breezes which sweep down from the snowy heights in the evening are most refreshing after the heat of a summer's day. At times, however, the winds are less benign, and burst forth suddenly in wild storms, which threaten to

carry all before them, and bombard the wayfarer hotly with volleys of sand and pebbles. The territory of Colorado is no doubt rich, containing mineral-bearing mountains, fertile valleys, and broad grassy plains. Its great defect as an agricultural country is its extreme dryness, and in order to render it productive, a system of irrigation, such as that established in Utah by the Mormons, appears absolutely necessary.

In the early spring the authoress and her friends crossed the Rocky Mountains to California, *en route* for Mexico. Railway travelling over the great chain is attended with considerable excitement in the winter season, on account of the steep gradients and the accumulation of snow at exposed points. The line is protected by sheds in most places; but now and again the train plunges into huge drifts as high as the tops of the cars, and has either to "buck" through or be dug out. The operation of "bucking" consists in detaching the engine and running it at top speed full tilt into the mass of snow, and repeating this again and again until a way is made through the drift by main force. Entering Mexico at Manzanilla, on the Pacific coast, the travellers crossed the country from west to east, emerging at Vera Cruz on the Atlantic side. The first portion of the journey was made on horseback or by waggon along the roughest and steepest roads, across unbridged streams and deep barrancas—great chasms which furrow the central plateau at various points; the whole way being beset by robbers and disturbed by local revolutions. Yet the rare opportunities of studying the country which the adventurous party enjoyed, and the extreme kindness and hospitality which they met with, amply compensated them for all drawbacks. This expedition through the western part of Mexico, so rarely visited, together with her brother's survey of it in the north and south, enable the authoress to speak of the resources of the country with far greater authority than could be conferred by the usual trip from Vera Cruz to the capital. The picture she draws of the natural wealth of Mexico—with inexhaustible mines of all kinds of minerals unopened, or but half worked by primitive appliances; its fertile lands, yielding in the Tierra Caliente all the products of the tropics, and in the Tierra Templada the wheat and corn and fruits of more temperate climes, and all these riches wasted or unutilised through the incurable idleness of the people, and the state of political insecurity—is a striking one. At the time of her visit it was impossible to pass from one town to another without infinite danger of being robbed by "ladrones," or arrested by "pronunciados." Even in the city of Mexico itself, where Juarez had been installed in power for several years, it was quite unsafe to drive to Chapultepec unarmed—a distance of less than three miles.

The remedies suggested for this condition of chronic disorder, which has lasted ever since the Mexicans threw off the Spanish yoke, now more than sixty years ago, is the establishment of a system of railroads. With rapid and easy communication between all parts of the country, *pronunciamentos* would be readily put down, and commerce would immediately increase. But then the dif-

ficulty is to establish the railways: the only one yet made—that from Vera Cruz to the city of Mexico—took twenty-one years to complete. Mexico herself cannot supply the means, and foreign capitalists are deterred by the general insecurity which prevails. Fresh projects for new railways are on foot, and there yet remains time for the establishment of a firm government able to maintain order and secure the development of the vast natural resources of the country, before the army of American pioneers, steadily marching southwards year by year, pours over the border.

But if when that time comes Mexico has still failed to secure a stable government, strong enough to enforce the laws and afford protection to all, the American people may find themselves irresistibly impelled to take the matter in hand.

W. B. CHEADLE.

Early Russian History: Four Lectures delivered at Oxford in the Taylor Institution.
By W. R. S. Ralston, M.A. (London: Sampson Low & Co., 1874.)

It usually needs some external impulse to direct attention in this country, even amongst the educated classes and in the Universities themselves, to any unfamiliar branch of study; and we may therefore thank the recent marriage of the Duke of Edinburgh with a Russian Grand Duchess for rekindling an interest in the annals of the bride's native land, which had died out at the close of the Crimean War, and for thus inducing the authorities of the Taylorian Institution to procure the delivery of these lectures by Mr. Ralston.

In a very modest preface the author compares his work to the *zakuska*, or snack, which precedes a Russian dinner. But he does himself much less than justice by such a parallel, because the *zakuska* consists on the one hand of things which we for the most part consider unwholesome, such as small saucers of caviare and salt cucumber, and glasses of *vodka*, and on the other of items which do not reappear in the course of the actual meal. He might have much more truly compared his four lectures to special dishes, *cours d'essai* wherewith a great culinary artist displays his powers, and vindicates his claims to be entrusted with the preparation of a banquet for royalty; while the epicure, anything but "serenely full," and eager for more, calls to him to continue his ministrations.

Russia, as having lain entirely outside the conquests of the Roman Empire, and not having contributed, like the Teutonic races, to its overthrow in the fifth century, begins its annals much later than any other European realm. France and Spain have eight hundred years of uninterrupted and ascertainable history before the legendary period of Russian chronology so much as begins, while British legend is restricted in the South to the early part of the English conquest, and in the North to the reign of the first three or four Dalriadan Scottish princes. The very first dawn of Russian legend is contemporaneous with Alfred the Great in England, Charles the Bald in France, Louis the Pious in the Western Empire, and Basil the Macedonian in the East, all of them

names which speak of a long settled polity in the full noontide of historical fact, while the earliest extant chroniclers who narrate the beginnings of Russia are separated by an interval of nearly three centuries from the events they profess to describe. The planting of Christianity in Southern Russia is in truth the first tangible fact which emerges from the vague mist surrounding the name of Rurik and his followers, seemingly a Scandinavian sept invited about the middle of the ninth century to settle as rulers at Novgorod. It is as difficult to say what is history and what is legend during this period, as to separate these two elements in our own story of Hengest and Horsa. But the Russian annalists give some particulars omitted by Mr. Ralston, which, if accurate, fix the origin of Rurik clearly enough. They allege him to have been born at Upsala in 830, son of a Swedish king Ludbrat, and his queen Oumila, daughter of Gostomysl, last President of Novgorod, who is said to have urged the people to invite a foreign chieftain to rule them after his death. The legends of Olga and her grandson Vladimir, through whose intervention and aid Christianity became established in Russia, form at once the most detailed and the most vivid portions of the accounts which have come down to us concerning the next century and a half; accounts which, we may add, though checked in some little degree by the Byzantine annalists, are mainly based on the narrative of Nestor of Pechersky, who may be styled, though at a vast interval, the Baeda of early Russian history.

The second period which Mr. Ralston has selected is that of Subdivided Russia; that is, as he afterwards explains, the era of the apanages, that system which fatally weakened the youthful nation, and left it an easy prey to the Tatar invaders. This system, of which Western Europe tasted some of the evil fruits in the wars of the great feudatories of France, was one by which the Lord Paramount, as feudalism would call him, the Bretwalda, to adopt our old English title, or Grand Prince (*Veliki Kniaz* *), as the Russians actually styled the chief successor of Rurik, was obliged to assign domains to his princely kindred, within which each was sovereign ruler; and so far from their being obliged to pay tribute and yield more than a mere honorary precedence to their nominal superior, he was actually compelled, as the head of the confederation, to give an account to them of his expenditure of all sums collected for joint national purposes. As there were incessant quarrels among these petty potentates, in which blood was freely shed, it is easy to see that the condition of Russia was even more disorganised than that of England under the Heptarchy. In truth, one fact which Mr. Ralston does not cite, lets us into the secret of the extent to which the parcelling out of the country was carried, namely, that in the great battle of Dimitri Donskoi against the Tatars, no fewer than five hundred and thirteen of these sovereign princes were slain. No wonder that the compact organisation of the Mongol

armies in the thirteenth century crushed the undisciplined levies of the Russian princes, which can hardly be called armies, but merely the aggregate of the personal retainers of each petty court. Though a few of the most illustrious names in Russian history adorn the dreary epoch of the Tatar domination, prolonged during two centuries, yet it is on the whole the time of the lowest depression of the country. There is once more a parallel in English history during the worst period of the raids of the Northmen, so far as widespread desolation and the destruction of religious houses with their precious literary contents. But the overthrow of Russia was much more complete than that of England, and no such identity of race existed between Tatars and Slavonians as between Danes and English, so that there never was any blending of conquerors and vanquished into one nation, nor would the haughty lieutenants of the Great Khan have stooped, like Svend and Knut, to wear the crown of the subjugated country as their chief title of honour. While recognising to the full the graphic power and skilful arrangement with which Mr. Ralston has narrated the story of this era, and depicted for us the tyranny of the Golden Horde, we cannot but regret his omission of one of the most picturesque episodes of the time, the retreat and permanent revolt of the Don Cossacks, a story which ranks in romantic interest with those of Hereward and of Wallace.

In the account of the gradual rise of the Moscow princes to the first place in Russia, not merely by their titular rank of Grand Prince, obtained through the favour of the Golden Horde, but by sagacious alliances, ruthless assassinations, and grasping conquests, which would not have discredited Louis XI. himself, Mr. Ralston has succeeded in disentangling a very difficult part of Russian history, and in making it quite clear to ordinary readers.

But we should have been glad to have had a little more from him about the troubles which the nation suffered from its Western neighbours. He does tell us something about the power and hostility of Lithuania, but we hear comparatively little of the Polish tyranny. If it were once recognised that Russia, in her stern policy towards Polish nationality and religion during the last century, has been doing little more than paying off old scores of oppression sustained at Polish hands, the popular judgment on the quarrel would be modified, if not reversed. The three figures which stand out most prominently in the front of the succeeding narrative are those of Ivan the Terrible, the usurper Boris Godunof, and the False Demetrius. Mr. Ralston does not forget to tell us how the second of these was author of the serfdom of Russia. The method he adopted, as it would seem, began by ingeniously extending the operation of the law of the commune, almost imperceptibly at first, till it made those who were once peasant proprietors mere *ascripti glebae*. This, of course, was a fresh element of national weakness in the period of anarchy which followed the death of the first False Demetrius, and which would have been as fatal to Russia as the apanages had been, if only a sufficiently sagacious and powerful invader had chosen

his time aright. A little more detail on this question of the origin of serfdom would have been desirable, if only to dissipate the erroneous notions to which Mr. Hepworth Dixon has given currency in his *Free Russia*. Mr. Ralston closes his lectures with the election as Czar of Michael Romanoff, grandfather of Peter the Great, in 1613, when the crown, which has since become one of the most mighty in the world, was not much more eligible than that of Greece when it went begging after the deposition of King Otho. In some brief supplementary appendices he has dealt more fully with some of the points he could merely touch on in the lectures, and confirmed the impression which they create, that he is competent to deal with the whole subject in more than popular fashion, and to give English readers, what they do not yet possess, a trustworthy, learned, and readable History of Russia.

RICHARD F. LITLEDALE.

Henri Beyle (otherwise De Stendhal). A Critical and Biographical Study. By Andrew Archibald Paton. (London: Trübner & Co., 1874.)

THE chief authority for the life of a man whose life was spent in gratifying his own tastes, expressing his own ideas, and analysing his own feelings, must necessarily be the man himself. Two volumes of Beyle's letters have already been published by his friend, editor, and biographer, M. Colomb, but they belong mostly to the period of middle life, at which the interest of autobiographies usually flags, because the character is formed, and the conduct is determined more by habit than by passion and opinion. Mr. Paton, however, has had access to "the whole of the intimate correspondence of Beyle with his family," no part of which had yet been published, and which includes a long series of letters to his sister Pauline, his most constant—perhaps his only fully trusted—friend and confidante. Beyle was born at Grenoble in 1783; in 1799 he was sent to Paris to complete his studies, under the protection of M. Daru, a connexion of his family, whom he accompanied on the Italian campaign in the following year. From this time until his stay in Milan, after the fall of the Empire had put an end to his official prospects, the materials at the command of former biographers were rather scanty, while the final estimate of the man himself cannot but be affected by a fuller knowledge of the steps by which his individuality developed. Beyle himself held, like Mandeville, that most human virtue was only natural vice cunningly utilised; and conversely, of course, most human vices should be bits of natural virtue mismatched, or out of place. This, at any rate, appears to have been the history of some of Beyle's own less amiable characteristics. The history of his life told in outline would prove him an egotist, the first glance at his works, a cynic; a comparison of the two might show him as habitually duped by the very weakness he was most constant in satirising; but there is at least an intellectual attraction about the cynical

* This is still the Russian title for the younger sons of a Czar, translated by Germans and French as "Grand Duke."

egotism that begins at home, and sacrifices its professor to the consistency of his creed. According to Beyle, the two motors in modern society, especially in France, are "le besoin de paraître" and "la crainte du ridicule," which last is defined as an apparent failure in the endeavour to *paraître*. Of course in a society governed by this ambition, there must be a tacit understanding as to what the members shall wish to appear, and the inherent inconsistency, *le ridicule*, of the Don Juanic ideal towards which Parisian aspirations gravitated, has never been more powerfully satirised than by De Stendhal. His own ambition was more distinguished; he had an intense consciousness of his own individuality, and he wished that individuality to appear clear and admirable before the eyes of the educated world. Authorship and conversation were the natural means towards the attainment of this result, his recognition by "the happy few," to whom one of his works is inscribed, as the great apostle of *Beylism*, as he was fond of calling the mixed mass of sentiment and paradox which formed his private philosophy. But the most scathing satire is seldom directed against a vice or weakness which the satirist only knows from outside. Thackeray's antipathy to snobs, and his intense sensitiveness to snobbishness, were not themselves the most elevated traits in his mental constitution, and, in like manner, all Beyle's crusading against vanity was marked by—as Sainte-Beuve observes—"un travers . . . qui nuisait même le talent" undoubtedly displayed in the attack. The same writer has characterised him as "un critique non pour le public, mais pour les artistes, mais pour les critiques eux-mêmes;" but the qualities required for such a post, the power of analysing the processes of analysis, of calling judgments to the bar of reason, of considering every work in relation to its effect, as well as to its intention, and allowing for secondary developments and reactions, all these applications of logical ingenuity to the decisions of taste have the disadvantage of sometimes missing their mark, and so becoming ridiculous—not from any defect in themselves or their originator, but from the dulness or prejudice of the spectators, too short-sighted to see, or too pre-occupied to care, whether the mark (perhaps a folly of their own) is hit or not, for of course there is no persuading a sentient target that it is badly hit when it has felt no blow. Beyle felt this difficulty, and professed that he should be content with forty readers if he might choose them himself (his book, *De l'Amour*, had nineteen), but since that was impracticable, "comme on redoute pour ses sentiments l'ironie qui les gâte"—he took to applying the irony himself, sometimes certainly with the effect he dreaded. In his letters especially he carried "la peur d'être dupe" to such a point as to seem the dupe of an expectation to find all feeling as much the result of a calculation as his own. He carried his disbelief in mankind to the credulous excess of assuming every fool to be a sceptical hypocrite. But this want of charity (he plays in one place upon the double meaning of the word *want*) is really the product of a morbidly acute sensibility, not of indif-

ference, to either the good opinion or the good offices of his fellow-men. One of his epigrams, "*La cruauté est une sympathie souffrante*," points to a truth of very wide application; in all self-conscious suffering there are two elements, the impulse to resent the pain, and the desire to escape from it; and it seems to depend upon the development reached by the purely moral sentiments, whether at any given time the natural "fellow-feeling" of humanity shall take the form of sympathy with the remedial instinct or the other. It is a *sympathie souffrante* that makes the hero in "Childe Roland to the Dark Tower came" exclaim of the wretched horse, "with every bone astare,"

"I never saw a brute I hated so,
It must be wicked to deserve such pain."

And in the same way Beyle's misanthropy, so far as it is a genuine feeling and not a cherished cover for paradoxes, is at bottom a *sympathie souffrante* with the human weaknesses that leave his own desire for sympathetic pleasures unappeased. The burden of all his early letters to Pauline is the woe of a character "incompris," of an "âme sensible" (in one place Mr. Paton translates this "sensible," rather to the confusion of the sense), condemned to associate with unresponsive, or envious, or unintelligent companions. He explains how he defends himself against *ennui* in uncongenial society by analysing the follies of its members: he divides society into "men of sensation and men of perception," and places his own philosophical superiority in the power he has of enjoying according to circumstances the pleasures of either class. If the perversity of mankind prevents his indulging in the sensations or sentiments he finds most agreeable, he consoles and revenges himself by recording his experiences; for, as he puts it at the age of twenty-seven, "When I write, my mind, occupied with the exact rendering of my thoughts, has no time to be disagreeably affected by the baseness of the model." At a later period he defined logic as "*l'art de ne pas nous tromper de route en marchant vers le but que nous voulons atteindre*," and it was certainly inconsequent, on his own principles, to place his happiness in the enjoyment of the pleasures of art, love and friendship at a time when he was sedulously making the latter impossible by his anxiety not to commit himself, or to allow his happiness to become dependent on anything less calculable and controllable than his own prudence. He had an unbounded admiration for English Utilitarianism in its crudest extremes, and having to choose between the pleasures adapted to his temperament and the search after such pleasures, chose the search, and pursued it with courageous, almost conscientious, consistency. His definition of the character of a man is "the way in which he habitually seeks for happiness;" he is severe upon the literary hypocrisy, *le béguéulisme*, which consists in "the art of enjoying with the tastes one has not got," and professes that the only things of which he was certain himself were his own likes and dislikes, and since to know these, and to expatiate upon his knowledge are quite different processes from feeling or indulging the likes themselves, and are perhaps more uniformly possible, all the principles of

Beylism combined to make Beyle primarily and mainly what Sainte-Bouve calls him, the critic of the critical class—as represented by himself.

After the campaign of Marengo, Beyle spent a few years in Paris, a few months in a counting house at Marseilles—he always had *vellétés* in the direction of trade speculation as a road to fortune—but in 1806 he re-entered the public service, was despatched to Brunswick as receiver of Domain revenues, employed himself with some zeal in packing up the Wolfenbüttel manuscripts for the Imperial Library at Paris, spent some months in Vienna after the battle of Wagram, returned to Paris in 1810, revisited Italy in 1811, and concluded, for the present, his official career by taking part in the Russian expedition and the retreat from Moscow. He was attached to the Commissariat Department, and Mr. Paton infers with some probability from expressions of his own, that it was on this occasion that he was honoured by a short (and by no means flattering) address from the Emperor in person. His letters during the campaign are perhaps, of all his writings, the least creditable to his intelligence; he carried with him the philosophy lately elaborated on Parisian boulevards, and its application to the altered circumstances of the philosopher confirms his other theories by becoming almost ridiculous through the simple force of inappropriateness. He was completely indifferent to the moral forces and political interests engaged in the struggle, but wished to derive as much intellectual and aesthetic satisfaction as possible from the contemplation of the drama before his eyes; but he failed entirely to see that a drama of that kind and scale can only be appreciated, even as a spectacle, by those who see in it something more than the material incidents. He wrote while Moscow was still in flames: "I needed to be alone or with people of intelligence to enjoy this imposing spectacle; but what spoiled the Russian campaign for me was, that I had to make it with people who would have dwarfed the impressions produced by the Coliseum or the Bay of Naples." The rigorous application of his Epicurean logic lands him in assumptions on a level with those of the hero in the *Triumph der Empfindsamkeit*.

In 1814, Beyle made his first appearance as an author, with a rambling *Life of Haydn, Mozart, and Metastasio*, purporting to be by one "Alexandre César Bombet," the first of the author's many aliases. The gross plagiarism from other biographers which distinguishes this work seems the more unaccountable because Beyle not only prided himself upon being, but really was, a distinctly original thinker; the fact seems to be, that he only took the trouble to think about subjects in which he was personally interested, and only about those up to the exact points to which his interest extended, and if this original matter was not enough to make a book, he had little scruple about carting into his pages a makeweight of undigested information to appease more omnivorous appetites. This work contains the first sketch of his theory of temperaments, reproduced in the *History of Painting*, which, though always supported by minute and ingenious

observations, scarcely seems to deserve the praise accorded to it by Mr. Paton and other admirers. Beyle's taste for mystifications, literary and otherwise, was certainly connected with his reluctance to be regarded as a professional author, but both together appear to be the result of an inextinguishable "besoin de paraître" in the most marked and versatile aspect, before the most intelligent and sympathetic of spectators, himself. M. de Colomb tells a story how, during the Terror, his parents were imprisoned, and he himself conveyed by his nurse to seek protection with M. Gagnon, Beyle's maternal grandfather and guardian. The danger of receiving the child of proscribed parents was discussed in family conclave, and the young Colomb was profoundly touched by overhearing his future friend, Henri, pleading his cause in eloquent soliloquy; it seems uncharitable to guess that the generous sentiments, which were no doubt sincere, were uttered aloud with the not quite equally sincere purpose of being overheard by the person interested; but the conjecture harmonises with the general impression of his character, up to the time when he proceeded to argue away the inclination to pose in public as a hero, on the ground that the most heroic posture of all was that of the philosopher despising public opinion. What phrenologists call secretiveness—a very different thing from general untruthfulness—is sometimes merely the symptom of timidity or shyness; but if the victim of shyness, or constitutional indisposition to *paraître*, is at the same time convinced that his appearance would be extremely effective if he could only accomplish it, he is not unlikely to waste a disproportionate amount of care upon the *mise en scène* of his small drama. Beyle had too much practical sense to trouble himself much about the fate of his books when they were written, but he did not choose to be known chiefly in general society as the writer of books which few people read. He preferred to make an independent impression as a brilliant *causeur*, and reserve the right of looking down upon admiration that ignored the larger half of his claim to it. His theory (borrowed from Hobbes) of laughter, and amusement generally—as the unexpected apprehension of one's own superiority—is quite adequate to account for the amusement he derived from the reflection that a great many people who thought they knew the man Beyle, knew nothing about the author De Stendhal, while the readers of De Stendhal were for the most part such ignoramus as to imagine that there was a real Baron of that name. The fundamental assumption that gives point to this joke for Beyle, is that his is a personality concerning which it is absurd for the world to be misinformed. When Haroun al Raschid or Goethe mix incognito with their subjects, the situation has a comic interest for outsiders, who foresee the excitement which will follow the disclosure, and measure the completeness of the hoax; but when Beyle passes himself off upon an innkeeper's wife as a commercial traveller under a feigned name, his amusement seems slightly out of proportion to the intrinsic absurdity of the incident, and so far tinged with the dreaded *ridicule* of personal vanity.

The same slight shade of egotistic stupidity appears in the emphasis with which he explains how he learnt to conciliate Italian ladies (who dislike the vanity of ordinary Frenchmen) and persons of the lower orders, by waiving all his natural superiorities and pretending for the moment to be exactly like everybody else—only a little more *sensible*.

His *Histoire de la Peinture en Italie* and *Rome, Naples et Florence*, the latter gossiping sketches of Italian society, diversified with a little moral speculation and paradox, were published in 1817, and favourably received by a small circle. The "History" is fragmentary and unsystematic to a degree; but considering the disorganised state of opinion on matters of art at the time, and the writer's natural inability to sympathise with the most powerful emotions expressed in Italian painting, his criticisms are surprisingly little out of date. It is true that he says in one place that Giotto's works are "désagréable à voir," but, on the other hand, it was an independent discovery that the painting of expression (or at least of variety of expression) began with Masaccio. His remarks on Lionardo are also interesting, especially on what were called his anatomical studies, which are more upon the general physical conditions and accompaniments of emotion than upon anatomy proper as mastered by Michel Angelo. Beyle was at this time an occasional contributor to periodicals, including *Colburn's New Monthly*, to which he furnished criticisms of current French literature: his view of contemporary art was that painting had become impossible in France, because there was "bon ton," that is, imitation, in every gesture; the actors in the human comedy imitate each other; the models for tragedy imitate Talma, whose attitudes, according to Beyle, formed the staple of the Salon of 1824. In 1822 his book *De l'Amour* was published, according to the preface, "an exact and scientific description of a sort of folly that is rare in France." It was a favourite doctrine with him that the charm of the Italian character lies in the emotional sincerity made possible by its complete freedom from vanity, all the harder and meaner elements being restricted to the region of practical affairs. His contribution to the Romantic controversy, *Racine and Shakespeare*, published in the following year, possesses all his characteristic merits of style and insight, but is spoilt as a book by a complete want of structure and coherence: it is the work of a critic too much accustomed to have his ideas kept together and in place by following the skeleton outline of the victim he dissects.

As a novelist, De Stendhal failed once or twice—in *Armance* (1827) and *Rouge et Noir* (1830)—before doing justice to his curiously individual talent in the *Chroniques Italiennes* and the *Chartreuse de Parme*, the latter the work upon which Balzac exhausted his copious vocabulary of praise and hyperbole. Against Balzac's ecstasies we may set Sainte-Beuve's reserve. The author of *Joseph Delorme* clearly dislikes, and indeed disapproves, the moral tone of the *Chartreuse*, a fact which, considering his usual tolerance, is calculated to give an unfair impression on the nature of Beyle's offences. He is not,

any more than Balzac, a pleasant writer, but his substance is harmless compared with that of many novelists of the Empire towards whom the great critic had no spontaneous feeling of conscientious dislike. What repelled him in Beyle was the extension to the passions of the sceptical criticism which both were ready to apply in politics, art or philosophy. To a formal moralist, the fact that Beyle did not really believe in the overmastering strength of disinterested passions seems to offer a guarantee against the multiplication in his romances of dangerous situations not vouched for by ancient records; and this is to some extent the case; but, on the other hand, a sentimentalist may easily give a moral colour to his instinctive dislike by objecting that no passion can be a worthy subject of artistic treatment except in proportion to its disinterested strength, and that this quality purifies and ennobles any passion, whether it is represented under circumstances which make its manifestations a crime or not. Beyle lets his heroes commit crimes without seeming to care as much about it as an honest criminal should. They are not impelled by the vague necessity that plays so large a part in Victor Hugo's conceptions; nor, as in Balzac, by the ever-growing entanglement of slight threads of inclination and opportunity; nor, as in writers of the highest dramatic power, by the moral necessity of co-existing passions to adjust themselves to each other in conquest or compromise; all that can be done to give the effect of truth by circumstantial realisation of every point in the narrative, he does with De Foe-like industry and much more than De Foe's intellectual inventiveness and insight. But, after all, the writing leaves behind it an impression of incompleteness, as if more had been promised than was performed: the careless reader who is only interested in the story might think that the plot was merely not woven up to the necessary degree of intricacy; Sainte-Beuve felt something like a hiatus between the action and the internal springs which should naturally account for it; a more critical realist might object that his representations really fall short of truth, in spite of the laborious analysis which they rest upon, exactly in those regions where the author's experience failed, and observation of the phenomena in others was impossible. His works remain powerful studies by an artist who never achieved mastery in production, and are recommended to students with the more confidence that they are not likely to *faire école*.

EDITH SIMCOX.

MINOR LITERATURE.

Boswelliana: the Commonplace Book of James Boswell. With a Memoir and Annotations by the Rev. Charles Rogers, LL.D., and Introductory Remarks by the Right Hon. Lord Houghton. (Printed for the Grampian Club, 1874.) Lord Houghton excuses the use of "Boswelliana" as the title of anecdotes collected by, instead of about Boswell, as it was that inscribed by the writer upon the original MS. This MS. was sold amongst his books, probably by mistake, as his private journal was at the same time destroyed by his family. After passing into Mr. Pigott's hands, it was sold with the remainder of the Brockley library, and more recently purchased by Lord Houghton. It is now printed for the first

time as a whole, but many of the anecdotes, especially those relating to Dr. Johnson, were used in the *Life*, while others have been handed down by so many gossips and memoir-writers as to be more hackneyed now than when they first went the round of well-informed society. Perhaps the chief interest of the collection is to show that Boswell's great talent had a real existence apart from the hero upon whom it was mainly expended. He Boswellised himself, his wife, his son, his friends, and society in general; and if his attention had not been concentrated upon the man whom he deliberately thought most deserving of Boswellian immortality, there is little doubt that his ambition would have led him to elaborate an autobiography or memoirs nearly equal in merit and interest to his actual work. The jottings in his commonplace book are of very unequal value, and there are many which an ordinary collector of *ana* would have rejected as trivial and pointless; but these are exactly the ones in which his genius as an observer and photographer of character is most conspicuous: the number of traits in the moral physiognomy of the sitter seized by the artist is the measure of his fidelity; and in the case of all the personages, celebrated or obscure, whose sayings Boswell has thought fit to preserve, we have the feeling that, if he had preserved observations enough of the same kind respecting them, the portrait would have completed itself in the same excellent style of art as that which immortalises the lexicographer. The memoir, which occupies rather more than half the volume, is unpretentious and readable, being based chiefly upon Boswell's own letters, especially those to his early friend, Mr. Temple (recently discovered and published by Bentley), and some, still in MS., to Sir David Dalrymple (Lord Hailes), preserved at New Hailes. The writer, by taking for granted most of the details bearing on Boswell's intercourse with Dr. Johnson, helps to correct the natural popular inference from the notoriety of that intercourse, that the biographer spent his whole life as the shadow of one man, instead of, as was much more nearly the case, in the incessant taking of silhouettes of all degrees of finish and merit. Even Boswell's vanity appears, on an impartial retrospect, as little worse than an eager desire to see and sketch his own figure at its best, leading to droll contortions in the artist which his involuntarily faithful pencil reproduces. He did not really mistake or misconceive his powers; he only wanted to enjoy, at the same time, the pleasures natural to their exercise and the praise which fairly belonged to that exercise. As Lord Houghton observes, "the most fantastic dream of his own self-importance would have been fully realised" by an anticipation of the deliberate judgment of posterity, as represented by Mr. Carlyle, on his character and merits. It is only contrary to the general instincts and usage of sane men to dream so much about the exact shape and size of the shadow they themselves cast.

The Life and Times of Louisa, Queen of Prussia, with an Introductory Sketch of Prussian History. By Elizabeth Harriot Hudson. In two volumes. (London: W. Isbister & Co., 1874.) This long and industrious compilation ought to be popular with the class who are inclined by taste for the study of the *Court Circular*, and qualified by education to enjoy an equivalent for the *Court Circular* relating to other Courts than that of Great Britain, and other dates than the current week. In historical capacity the author is inferior to Miss Strickland, who, moreover, had the advantage of writing about times concerning which it was a merit to have an abundance of even imperfect and trivial information. She has consulted a variety of recent works, good, bad, and indifferent, but her references are given with a sublime generality to "Carlyle" or "Alison," and she has so little conception of the natural uses and nature of an authority that she quotes "Alison" for such "facts" as that Napoleon was seriously anxious that he should be intercepted by Nelson on his way

to Egypt. The history and character of Queen Louisa are interesting enough in themselves to make it regrettable that the only book which is likely to be written on the special subject in English should be so hopelessly unintelligent in its execution as to repel everything but idle curiosity or the appetite for Court gossip of the dullest—it must be added of the most moral and religious—sort.

Life of Dean Alford. (London: Rivingtons.) As this book has reached a third edition, we suppose that Dean Alford's admirers think that it was a service to his memory to publish it. At all events, the unreserve of the editor enables us to know him inside and out, for he wrote down everything he thought and felt, as he printed all that he knew. He was engaged at twenty-two, after an attachment of sixteen years, and a brilliant career at Cambridge, where he was numbered with the "apostles" when Tennyson and Hallam were members of the college. He had naturally a quick and fluent mind, and as he conquered the power of early rising and hard work, his combination of fervent piety with wide, if not intelligent, sympathy, raised him to the rank of an ecclesiastical personage. He killed himself by restlessness: at sixty he undertook an edition of the Old Testament for English readers, in 5,000 pages, to be finished in seven years, because, he said, "editing reviews, writing in *Good Words*, &c., &c., does not seem quite heavy material enough for luggage for the long journey."

He was quicksighted and shortsighted in most matters of opinion theological and political, and so was always just a few years ahead of the British public in his judgments, as in this, which was written October 9, 1870:—

"Their ingratitude [that of the French] to Louis Napoleon, who did more for them commercially than any man in his time, is abominable. But I begin to fear the Germans are set upon building up even a greater and falsier state of things than the French ever did. The French fallacy was supremacy by means of an army. The Germans' is the greater crime of universal military life, and by means of it the unchristianising of Europe: at least I fear so."

Borland Hall (Macmillan & Co.) is not an advance on *Obrig Grange*: it contains nothing nearly so good as the fifty or sixty pages on the father and mother of the heroine. It is a story of a Scotch student whose mother has got her second husband to disinherit his daughter in her favour, staining her conscience for the sake of her son. Her death and the knowledge of her guilt drive him wild, and he abandons his property to look for the children of the disinherited daughter. One is a Socialist leader, the other is the girl he was in love with when he was a happy student, so the recognition sets everything right. The mother's explanation has a good deal of grim power in the execution, though the conception is cheap; the same may be said of a soliloquy of the hero's on the question whether a young man had better curb his animal nature or idealise it. The description of Borland Glen is very crisp and good. There are a great many pieces of miscellaneous verse inserted in the story on more or less exciting and popular topics, that show some readiness of thought and feeling, and are rather like the crackling of thorns after all. They may remind some readers of the verse in a book of Miscellanies, partly in prose, called *Carl's Legacy* which was published some years ago by Edmonston & Douglas. If *Obrig Grange* is by the author of *Carl's Legacy*, the advance would be very surprising.

The seventh edition of Mr. Locker's *London Lyrics* (Isbister & Co.) contains eight new poems: one, the "Unrealised Ideal," is so exquisite in execution, that the humility of the sentiment is surprising. The final note explains the writer's view of the art of which he is decidedly the first living master, though he cannot practise it to his own satisfaction. In his brief review of his predecessors, it may be doubted whether he does full

justice to Moore, and he seems to admire Præd without sympathising with him: perhaps the way in which he speaks of the two throws some light on the qualities and limits of his own gift; it is certainly characteristic that a writer with such quaint, shy, sincere tenderness should find Moore's effusive sentiment unreal.

A Few Pages from Real Life. By C. I. Osborne. (London: Chapman & Hall, 1874.) The friends to whom Mrs. Osborne dedicates her work must be very unlike the friends of Mr. Peter Magnus if they are not amused by it. The author appears to be one of those ladies who wander over the continent of Europe entering into religious controversy with every one they meet. Mrs. Osborne began at Folkestone, where she had an argument about the comparative probability of the miracle of the tribute-money and that of the Holy House of Loretto. Her opponent was inclined to accept both events as historical, but Mrs. Osborne felt that one must draw the line somewhere. She then goes on in this connected way:—

"So it seems to me, that according to him, many of the Popes having been the wickedest of men, is fully accounted for.

Archbishop Manning did me the honour to call upon me.

He is very like the portrait of S. Augustine, by Ary Scheffer; perhaps he sate for him.

Again, the Romish and High Church parties maintain—"

well, it does not matter very much what they maintain, but it is cheerful to learn that Mrs. Osborne has found out that "water is matter." A little later she says that "almost any route was the same to us," and, indeed, with her "all roads lead to Rome," and to condemnation of the wicked practices and foolish dogmas of Catholicism.

There are moments when Mrs. Osborne deserts theology for a kind of social metaphysics. Thus, after lamenting the absence of Condyl's fluid at Stuttgart, she says:—"Life becomes an objective romance to read the endings thereof, when romance has been expunged from subjective life." We have copied out this sentence very carefully. It sounds like a quotation from Hegel, but it is so much more difficult, that it may be an utterance of the Stuttgart school of philosophy, and a result of the entire absence of Condyl's fluid in that district. Returning, after one sentence about the Grand Duchess of Baden, Mrs. Osborne reconsiders the Stuttgart question, not as before on the *a priori* method, but from the practical side. "It is such a mass of vineyards that an enormous quantity of manure is required."

Coming from Mrs. Osborne's sanitary metaphysics to her views of art, we find her saying that "Lord Lytton is dead; he is gone to meet the Classics he thought so much about, and a greater than any of them." None of the classics were lords, and no doubt Lord Lytton is a good deal looked up to in Limbo, where the Classics are. Returning to ordinary life, Mrs. Osborne remarks that "there are two common little comforts wanting almost everywhere on the Continent—the beds never have under blankets, and they are always trying to make one drink out of those poisonous syphons instead of having proper soda-water in bottles." This is, indeed, to add injury to insult. Not that one generally expects beds to have proper soda water, even in happy England; but as they have got so far as to possess syphons, they might pull themselves together a little, and have soda-water which combined propriety with bottles.

But one must tear oneself away from a *Few Pages from Real Life*. Mrs. Osborne's sayings are like Madame de Sevigné's cherries. "You take the best first, then the second best, and end by eating them all." But time and space prevent us from reproducing all the good things in a book, which goes far to prove that Mrs. Nickleby may have been a Page from Real Life. EDITOR.

NOTES AND NEWS.

PROFESSOR SEELEY is to give a course of lectures on some period of modern history to the ladies' class at Brighton, in the October term.

WE understand that during the summer session Professor Morley has been lecturing on English literature to more than 1,500 pupils, in his various classes in different parts of England. His University College classes in London contain over 120 pupils, the senior Anglo-Saxon class consisting of eight good students, who can translate English into Anglo-Saxon.

THE first volume of Mr. William Chappell's *History of Music*, including the Egyptian and Greek poets, is in the binders' hands. The second volume, dealing with Hebrew music, is to be by Dr. Ginsburg, and part of it has been long written. The third volume, on mediæval music, will be by Dr. Rimbault.

MR. CHAPPELL has now in hand the completion of the second volume of his edition of the Roxburghe Ballads for the Ballad Society.

MR. HENRY SWEET's *History of English Sounds* is now at press for the Philological Society. Mr. Sweet has undertaken to edit *An Anglo-Saxon Reader* for the Clarendon Press, to head its series of English School and College Books.

M. GASTON PARIS is going to add to the French translation of Diez's *Grammar of the Romance Languages*, a fourth volume, which will contain: 1, a long Introduction on the History of the Romance Languages and of Romance Philology; 2, additions to and important corrections for the three volumes of Diez; 3, a full analytical table of the four volumes.

A NEW association is being formed to provide a "Lecturers' Benevolent and Provident Fund," and afford assistance in time of need to members of a laborious profession.

THE Crystal Palace School of Art and Literature is doing useful work, and the encouragement it meets with is satisfactory. The lectures delivered in German to the Ladies' Department by Dr. Heinemann have been sufficiently appreciated to induce him to publish, as the first of a series, his lecture on Albrecht Dürer and Holbein.

THE first sheet of Mr. Henry Cromie's Rhyme-index to the Ellesmere MS. of Chaucer's *Canterbury Tales* is now in type. It is interesting as showing the occasional liberties that Chaucer took with his rhymes, making the perfect of *have*, both *hadde*, to rhyme with the adjectives *badde*, *sadde*, the perfects *ladde*, *shadde*, &c., and *hade* to rhyme with *blade* and *spade*.

THE New Shakspeare Society now numbers 401 members. Dr. Ingleby's General Introduction to Part I. of the Society's series of *Shakspeare Allusion Books* is in the press, and the first part of the Society's Transactions, which has been long in type, is nearly ready for issue.

At the recent sale of the late Sir William Tite's library, the British Museum acquired two volumes of cuttings from a MS. missal of the beginning of the fifteenth century. The cuttings comprise a large number of initial letters of various designs, together with a certain number of miniatures, some of which are executed with the greatest skill. They are of particular interest as specimens of English art of the period, of which there are not too many examples extant; and could not find a more appropriate resting-place than the Department of MSS. of the British Museum. The MS. from which they have been so barbarously extracted must have been a remarkably handsome volume, which might have borne comparison with the Sherborne missal, a finely illuminated MS. of the same period, now in the possession of the Duke of Northumberland.

WE are glad to see the pleasant feeling that prevails between some of the leading German and

French philologists. Professor Schade, of Königsberg, the editor of the *Wissenschaftliche Monatshefte*, has printed in it a most kindly article on the French *Romania*, doing full justice to it and its editors, Messrs. Paul Meyer and Gaston Paris, and wishing them and his fellow-workers on the Seine, Loire, and Garonne all success. Professor Schade protests against those so-called national prejudices, which, covering themselves with the cloak of a false patriotism, are, in fact, only the product of impudent ignorance, and most hindering to the development of civilisation.

PROFESSOR DELIUS is lecturing at Bonn on the Historical Grammar of the English Language.

PROFESSOR HORSTMANN continues his Early English texts from the Laird MS. 108 in the *Archiv für das Studium der neueren Sprachen*: in No. 51 he printed "The Life of St. Alexis;" in No. 52, "The Sayings of St. Bernard, and the Vision of St. Paul." In the same No. 52 appeared a print of the "History of Arthur," from the Early English version of Wace's *Brut* in the Harleian MS. 24, edited by Dr. Béddeker.

WE learn from *Polybiblion* that M. Ch. Emile Ruelle has just completed a work entitled *Bibliography of Gaul*, which will be at once printed. It contains about 9,000 articles, and is divided into two parts, the first giving under the name of each author as complete a list as possible of historical works relating to Gaul; and the second having the subject-matter arranged in topographical or scientific groups. M. Ruelle's work will doubtless meet with a favourable reception from students of bibliography and archaeology.

THE Academy of Floral Games has very much to answer for. Its prizes for 1874 called into existence no less than 622 copies of verses; namely, 73 odes, 43 poems, 30 epistles, 3 discourses in verse, 35 idylls, 59 elegies, 3 ballads, 35 fables, 35 sonnets to the Virgin, 249 miscellaneous poems, beside 9 discourses in prose. How the butter-mongers and trunk-makers must bless the Academy of Floral Games!

THE French papers announce the death of Ludovic Vieillot, music and song publisher. Among his publications were the first songs of G. Nadaud, the complete works of Charles Colmance, Mahiet de la Chesneraye, L. Festeau, E. Donné, C. Gille, and the composers J. Darcier, J. Couplet, and V. Didier. In all he published about 50,000 songs, 10,000 with their music. He had also formed a theatrical and musical library of 6,000 volumes, many of which are very rare, and his house was described by a friend as "a perfect Louvre of song."

THE announcement of the death, at Grätz, on June 12, of Vincenz Zusner, recalls the name of an Austrian poet whose patriotic lyrics and *vers de société* have been almost forgotten by his countrymen, except in Styria, where his songs may still be heard among the hardy mountaineers, with whom they have long ranked as the most cherished of their national poetry. Zusner, who had attained a great age, and outlived his few relatives and the greater number of his contemporaries, has left his fortune, which was considerable, to local charitable institutions.

PROFESSOR UNGER has contributed a valuable addition to antiquarian literature in his recently published *Postola Sigur*, a collection of legendary stories of the lives of the Apostles, their strife for the spread of Christianity, and their death by martyrdom. These sagas were originally taken from Latin sources, and as many of them occur in Icelandic MSS. of about the year 1200, it seems probable that most of them came into existence during the last half of the twelfth century. In the thirteenth century several of them were revised and augmented by extracts from the Fathers and the usual encyclopædic works of the Middle Ages, such as the *Historia Scholastica* and *Speculum Historiale*. Unger has in this edition collected the various versions of these sagas, and

collated for the purpose various MSS., of which the greater part are to be found in the Arne-Magnaean collection in Copenhagen. The editor's preface, occupying thirty pages, describes the different MSS. which he has used; we may repeat one curious observation to the effect that one of the MSS. from Iceland had been cut up and used to make shoes of, a fate that has destroyed many a valuable Iceland parchment. The work is published by Bentzen, of Christiania.

THE once famous political writer, C. N. David, died at Copenhagen on June 13, in his eighty-second year.

IRONICAL commentators on our progress and civilisation are very fond of pointing out that the barbarous laws against conjuration and witchcraft were not repealed until the reign of George II. A curious illustration of the working of these laws nearly two centuries ago is contained in the following extract from a letter, preserved amongst the unpublished State papers, of Francis North, afterwards Lord Keeper of the Great Seal. At the time of writing North was a Lord Chief Justice of the Common Pleas; he was at Exeter on circuit, and writes from there on August 19, 1682, to Sir Leoline Jenkins:—

"Here have been 3 old women condemned for witchcraft; your curiosity will make you enquire of their circumstances. I shall only tell you, what I had from my Brother Raymond before whom they were tried, that they were the most old decrepid despicable miserable creatures y^t he ever saw, a painter would have chosen them out of the whole country for figures of that kind to have drawn by, the evidence against them was very full & fancifull, but their own confessions exceeded it—they appeared not only weary of their lives but to have a great deal of skill to convict themselves; their descriptions of the sucking devills with saweer eyes was so natural, that the jury could not chuse but believe them. Sr. I find the country so fully possessed against them, that though some of the virtuosi may think these things the effects of confederacy melancholy or delusion, & that young folkes are altogether as quick-sighted as they who are old and infirme, yet wee can not reprove them, without appearing to deny the very being of witches, which is it contrary to law, so I think it would be ill for his Ma^{ty}'s service, for it may give the faction occasion to set afoot the old trade of witchfinding y^t may cost many innocent persons their lives, w^h this justice will prevent."

THE letters of Matthew Prior, which were included in our summary of the contents of the Macclesfield papers, now belonging to the British Museum (see ACADEMY for February 21, 1874), do not appear, upon examination, to possess much literary or biographical interest. They are chiefly short semi-official communications to the Under-Secretary of State, John Ellis, giving the chief items of continental news during Prior's mission to the Hague and Paris, a period ranging from July, 1695 to July, 1699. We give here the few passages which most attracted our attention.

Writing from the "Hague y^e 2^o 1^o July, '95," Prior concludes:—

"I have printed in Dutch and French the bombarding St. Malo, and distributed it to all the Ministers and Politicians here, to the great discouragement of some of our Nouvellists, who give a certain French turn to our affairs when they relate them."

Another letter, dated June 5, 1706, has an allusion to one of his minor writings:—

"I ought to be angry with you for drawing up a letter of immoderate praises in the name of Mr. Secretary, which I hope He only subscribed as the King does the circular letter, and for recapitulating the same Praises in your own of the next post the 15th, however my resentment at this time shall go no further than to tell you that I wish the Poem but half so good in its kind as your Prose upon it, and that having written what you will see to Mr. Secretary I have no more to trouble you with than that I am &c."

"Mr. Secretary" we would fain believe to be Prior's friend and patron, Charles Montague,

afterwards Earl of Halifax, though it was hardly his official designation at that time.

Our next selection exhibits the poet hard at work on the details of the Treaty of Ryswick, which was signed on September 11 following.

"Hag: ye 33 Augt 1697.
"Our own affair is (God be thanked) in agitation, and is doing as most things in this world with violence and hurry, you that have been in business in all its shapes know so well how it happens in these cases that you will easily excuse my not answering yours of the 3^d sooner, and believe me that the 8 last days of my life have been not unlike every day of poor Cardonnel's, that is, writing my self blind, and going to bed at 3 in the morning without having eaten my supper: if all this trade ends in a Peace I shall not regret my pains, our Ministers are every day at it, and I think it advances every way but towards Vienne, these people (like those in the Scripture) must be compelled to come in, and necessity which they say has no law must give us *Jus pacis*."

Cardonnel was the hard-working secretary of the Duke of Marlborough.

We have space but for one elegant extract from his correspondence after reaching Paris. This is dated Paris, Sept. 6, 1698, and runs thus:—

"I have nothing worth troubling Mr. Secretary with, and am not in a very good stile at present, having been for these 3 days past with Custom house officers and Porters fighting and squabbling about *les petits droits et les aides d'entrée*, so that *Mallotier, chien* and *bougre* are the civillest words that have come out of my mouth. I have only time to alter the language one moment, whilst I tell you that I am most truly, &c."

A volume of miscellaneous correspondence in the same collection contains a few letters of Richard Steele to Ellis, chiefly remarkable from their having been written before he had abandoned the profession of arms for that of letters; they are dated between March and July, 1704. It may be worth while to print one as a specimen:—

"March 25, 1704.
Land-Guard-Fort.

"Sr,

"I was ordered hither on a sudden, or had waited on you to receive your commands, but indeed I do not trouble you only to make my apology for that, but also to desire your Freindship and interest to the Duke of Ormond in my behalfe: What I would pretend to is a Troop in a Regiment of Dragoons I understand he is going to raise to be commanded by His Grace himself: This request is the more reasonable for that it is no advancement of my post in the dignity, but the income of it only, since I am already a Captain. If I can be so fortunate as to have any encouragement from you in this matter, I'll hasten to town. In the mean time any commands from you will be receiv'd as a very great Honour to Sr,

"Y^r most obedient Humble Servant,

"RICH^d. STEELE."

Endorsed "Capt. Steele."

MR. HALLIWELL'S "Hint on the Date of *Coriolanus*, and possibly other Roman Plays," was communicated last night to the New Shakspeare Society, by Mr. Furnivall. It is this, that on comparing the different early editions—1579, 1595, 1603, 1612—of Sir Thomas North's *Plutarch's Lives*, to find out which of these editions Shakspeare used for his Roman plays, Mr. Halliwell had noticed many small differences between the editions, and had in one case, in *Coriolanus*, hit on a word, "unfortunate," altered by the 1612 edition from the former ones' "unfortunately," which "unfortunate" was the word used by Shakspeare in his Tragedy of *Coriolanus*. This was therefore *primâ facie* evidence that Shakspeare used the 1612 edition of North for his *Coriolanus*, if not for his other Roman Plays. Here are the extracts:—

SHAKSPEARE, *Coriolanus*, Act V. sc. iii. l. 96—8, Tragedies, p. 27, or 625, ed. Booth:

Volum. . . . Thinke withthy selfe,
How more *unfortunate* then all living women
Are we come hither. . . .

SIR T. NORTH'S *Plutarch*, 1612, p. 254:

But think now with thy selfe, how much more
unfortunate then all the women living, we are come
hither. . . .

Ed. 1603 and 1595:

But think now with thy selfe how much more *un-*
fortunately then all the women living we are come
hither.

Ed. 1579:

But thinke now with thy selfe, howe much more *un-*
fortunatly, then all the women livinge we are come
hether.

Coupling this fact with the other that Mr. Paton claims to have established, namely, that Shakspeare's own copy of the 1612 edition of North's *Plutarch*, with his initials W. S., is now in the Greenock Library, we have a strong *primâ facie* case for the use of that edition by Shakspeare in his *Coriolanus*; for, as Dyce well says, this Play "is proved by the style to have been one of the author's latest compositions." But is the evidence anything more than *primâ facie*? Without doubt, Shakspeare may have altered the "unfortunately" of the earlier editions, to the happier "unfortunate" of his text, from his own instinct and ear, without seeing the edition of 1612, just as he altered, by ear, "the naughtie seede and cockle of *insolencie* and sedition" (North, p. 229, ed. 1612), of the earlier editions (the 1595, at least), into

The cockle of Rebellion, *Insolence*, Sedition.
(*Cor. III. i.*)

But if we compare the long line with "unfortunately," with other like ones that Dr. Abbott has collected (*Shak. Gram.* pp. 405-7), we may see that it would have been at least allowable. 1. If the extra syllable is to come in the middle, the line being scanned with a central pause:—

How more | unfor|tunately | than | all | living | wo-
men.—*Cor.*

Shall I | attend | your lordship? || Aug. Atan|y time |
fore noon.—*M. for M.*, II. ii. 160; see II. iv. 141-2.
For ending thee | no sooner. || Thou hast | nor youth
| nor age.—*M. for M.*, III. i. 32.

That I | am touch'd | with madness. || Make not | im-
pos|sible.—*Id.*, V. i. 51.

Did in | your name | receive it: || pardon | the fault |
I pray.—*T. G. of V.*, I. i. 40.

2. If the extra syllable is to come at the end:—

How more | unfor|tunate|ly than | all liv|ing wom|en.
Cor.

Upon | our hous|e's thatch, | whiles a | more fros|ty
peop|le.—*Hen. V.*, III. v. 24.

Unto | a poor | but worth|y gent|leman | she's wed|ded.
Cymb., I. i. 7.

I do | beseech | you, par|don me, | I may | not show
| it.—*Rich. II.*, V. ii. 70.

On the whole, then, Mr. Halliwell's hint may be held a good one, for which, as for countless former services, Shakspearean students will be grateful to him.

A good deal of attention has lately been paid to the daughters of Louis XV. Attempts have been made by some to prove that one of the six was a saint, by others to prove that three at least were stained with abominable crimes. Both are alike unsuccessful. M^{de}. Louise appears, from an article by M. Jules Soury in the *Revue des Deux Mondes*, to have been diseased in mind and body, a mixture of wounded vanity, ambition, casuistry, and intrigue. The others had, in greater or less degree, the merits and defects of the house of Bourbon. Voluptuous and full-blooded, devoted to the pleasures of the table and the chase, with constitutions prone to hereditary disease, and good natural abilities debased by the wretched education of the convent and the Court, and soured by the disappointments of a useless life, they were but ill-fitted to bolster up a falling dynasty, to foster the feeling of loyalty in an exasperated people, to recommend the precepts of Ultramontanism to a nation of sceptics and Encyclopedists. Their influence over their unhappy niece, Marie Antoinette, was for evil, as she herself at last

recognised. Their language was too free for the by no means fastidious courtiers of the eighteenth century. The affection which they bore their father, one of the redeeming traits in their character, deep and self-sacrificing as it was, was too effusive to escape scandal. The little traits which distinguished the sisters, except the scheming devotee Louise, and perhaps the timid Sophie, are well brought out by M. Soury, who is a careful student and able exponent of character. Their dispositions were mainly Bourbon, intermingled with some Polish traits inherited from their mother, Maria Leczinska, whose joyless destiny irresistibly reminds us of Catharine of Braganza, as the records of the Louis Quinze period so often recall the vivid pages of Pepys and the England of his day. The record of their lives is in itself no great contribution to history. The eldest, Elizabeth, became the wife of the third son of Philip V. of Spain, afterwards Duke of Parma, a dissolute, weak-minded prince, who was always out at elbows. She was known as the poor Duchess, and was saved from utter misery by her love for her children, a feature which she shared in common with her father, Louis XV. The others were never married. M^{de}. Louise, the youngest, retired in 1770 to the Carmelite monastery of St. Denis, her "angel" being Julienne de MacMahon, and became the mainspring of Jesuit intrigues and Ultramontane intolerance, and a passionate collector of all sorts of relics, especially the entire bodies of saints. Only two, Adelaide and Victoire, were living when the Revolution—which their father had but too surely foreseen, and had done his best to render inevitable—burst upon France. They fled to Rome, and, on the approach of the revolutionary armies, to Trieste, where Victoire died in May, 1799. Her sister, the impetuous and masculine Adelaide, did not long survive her, and died in great obscurity on February 18, 1800. All who are interested in the domestic history of the period which preceded the great Revolution should turn to this article. M. Soury has consulted the chief works recently published and a number of inedited documents, and he has invested with wonderful life and reality the biography of these last daughters of the House of France.

NOTES OF TRAVEL.

A RECENT Consular Report on the public works of Portugal, tells us that road-making, after some years of activity, is at standstill; a tramway has, within the last few years, been made from Oporto to the mouth of the river Douro, a league away, and is now in full working order; a steam tramway is projected to Villa do Conde, twenty miles north of Oporto, which, besides carrying passengers and goods, may possibly find a profitable source of traffic in the iron ores which exist at the north terminus. It is not, however, as yet publicly established that these ores are rich enough to pay for transport to Great Britain. A line of railway is also being made from Oporto to Braga, and it is intended that the railroad should cross the Douro by a bridge, and connect the northern line with that from Oporto to Lisbon.

We shall certainly have severe measure dealt out to us by posterity, and it is fortunate that those who come after us will be able to vent their spite only on our memories or our bones. We are using all the coal in the earth at an ever-increasing rate, and it now appears that sulphur, in Europe at least, will not hold out much longer. It is estimated that the sulphur in Sicily will be exhausted in from fifty to sixty years. There are about 250 sulphur-mines in the island, producing about 1,800,000 quintals yearly, beside the enormous quantity which is lost through defective methods of working. In 1871, 1,725,000 quintals were exported, of which England took from 500,000 to 600,000, and France about 400,000

quintals. The ore contains from 15 to 40 per cent. of pure sulphur, but the average amount extracted is only 14 per cent. The sulphur fetches at the pit's mouth about 6 fr. 60 c. The estimate of the approaching failure of the supply in Sicily appears to be well-founded, as may be gathered from an article in the *Revue des Deux Mondes*, summarising a report addressed by Signor Parodi to the Italian Government.

Happily, the place of sulphur is in great part supplied by pyrites of iron, which is very cheap and widely diffused, and 800,000 tons of which are used in Europe annually. Pyrites is used for the manufacture of sulphuric acid, and though the iron extracted from it is of very inferior quality, it often yields a considerable quantity of copper, which doubles its commercial value. Again, large quantities of sulphuric acid are used in various manufactures, and pass into the refuse; if this refuse be chemically treated, perhaps as much as 1,000,000 quintals of pure sulphur might be extracted from it. Directly and indirectly, therefore, pyrites will supply the place of sulphur, if the latter fail, as fail it undoubtedly must in Sicily in little more than half a century.

A RICHLY illustrated work on Italy, under the title of *Italien, eine Wanderung von den Alpen bis zum Aetna*, has been announced by Messrs. Engelhorn, of Stuttgart, as ready for the press. From the sample of the letterpress and illustrations that we have seen, we are disposed to regard it as one of the best finished and most perfect works of the kind that has as yet appeared, and the publishers deserve much praise for their enterprise in venturing upon the undertaking. It is to appear in twenty-four numbers, and will contain about 400 pages in all, and upwards of 300 woodcuts, which illustrate the scenery, the customs, dress, and appearance of the people, and the historical, archaeological and other interesting remains of the Italian peninsula.

THE last mail brings the intelligence that the winter in Persia has been unusually severe. Even now the Elburz mountains, lying north of Teheran, are covered with snow, and snow was still lying about Teheran as late as March. The capital had suffered considerably from a very severe thunderstorm, accompanied by a violent wind, which uprooted several large trees and unroofed many houses, damaging a great amount of property. The lightning struck one of the minarets of the city gates leading to the Shamram district, throwing it to the ground and killing a number of asses which were standing under it. This gate was a very fair specimen of modern Persian architecture, though it would not bear comparison with the few existing monuments of the Sassanian period. Its copings were of enamelled tiling and mosaic, so that at a distance it was a very effective object. The harvest for this year of grain, fruit, and grapes is expected to be much above the average. It is reported that part of Baron Reuter's staff for the construction of the railway from Resht to Teheran have left the country.

It is stated that the first collection of the plants of Hongkong ever sent to the British Museum has been forwarded by the Rev. James Lamont. The consignment is composed of 350 specimens, including 53 ferns, all indigenous to Hongkong. Mr. Lamont hopes shortly to be able to send further specimens, so that in course of time a complete collection will doubtless be found in the British Museum Herbarium. It is believed that at present Kew is the only place which possesses anything like a Hongkong collection.

IN a recent communication to the Paris Geographical Society, the Abbé Durand, librarian of the Society, gives particulars of the explorations of the chief of the French mission of Loango, in the province of Kacongo. One of the principal rivers of the province, the Chilongo, navigable for steam-boats and row-boats, runs through fertile valleys in the midst of magnificent forests, which fringe the stream from its source to its

junction with the sea. It is the great commercial highway between M'boma and Loanda, and the natives entrust their palm oil to the current enclosed in large tubes tied together seven or eight in a batch. The tide carries them, with their owners, down to Landana, where they are brought to land and sold to Europeans. The other products of the country are brought down on rafts in a similar way. There are five European trading establishments on the river. The palm which produces the oil grows abundantly and without culture, and the natives are entirely employed in getting the oil. Each tree produces, on the average, a quantity of oil valued at from 25 francs to 30 francs per annum. Kacongo, although considered to be a province of Loango, forms a kingdom of itself, and has for its capital Ringuélé. The name of the last king was Don Jao Capitao Mempolo; he died some years ago, but his burial has not yet taken place, owing to some foolish custom or superstition prevailing in the country. The nephew, who is heir to the throne, therefore governs under the title of regent until his uncle is buried. His name is Muata Bona.

A PAMPHLET, recently published in Paris by M. Dubuisson, gives interesting details of the extraordinary development of railway communication in Peru. This favoured country, with its variety of climate, its inexhaustible mines, its wonderful flora and fauna, possesses two sources of wealth superior even to these—nitrate of soda and guano. The quantity of nitrate of soda exported rose from 1,300,000 quintals in 1860 to almost 4,000,000 in 1872, while the guano exported, of the value in 1863 of 65,000,000 francs, had risen to 225,000,000 francs in the two years 1871-1872, or an average of 112,500,000 francs per annum. To bring this vast wealth within reach of European enterprise, Peru now possesses, or will shortly possess, eleven lines of railway belonging to the State, and nine to private companies, beside two which are partly public and partly private property, or in all 2,030 miles of railway, constructed at a total cost of about 36,000,000 sterling. The most remarkable of these lines are—that from Callao and Lima to Oroya, about half-finished, a triumph of engineering, which crosses the Andes at a height of 15,000 feet above the level of the sea; that from Cuzco to Juliaca and Puno, 230 miles in length, on the lofty plateau of the Andes, at a mean elevation of 14,000 feet; and that from Mejia to Arequipa and Puno, 339 miles in length, establishing a communication between the Pacific Ocean and Lake Titicaca, 13,902 feet above the level of the sea.

A FRENCH resident in South America has presented to the Museum at Nancy the embalmed head of a slain Indian chief, from the banks of the Amazon, named Micanapita. The head, which has the hair attached, is reduced to about half the original size; and the *Débats* states that there are only eight heads thus embalmed known in European collections. They are worn as trophies by the Jivaros, a tribe of the warlike family of the Guaranis, which is spread over the east of South America. The Jivaros inhabit the countries bordering on the Maraynon, especially to the north, where they are dependent on the Republic of Ecuador. They are continually at war with their neighbours, the Aguarunas, and the heads which are subjected to this operation are usually those of Aguaruna chiefs. The head is first boiled, then the skin is detached from the bones, stuffed, and dried by smoking or by means of heated stones. Holes are then bored in it, and it is hung by a cord and decorated with the plumage of humming-birds and long cotton fringes. The general effect is highly artistic, and an extremely elegant trophy is the result; but we are assured that, so far as the object is to preserve the features in a recognisable condition, this mode of embalming is not a success.

FROM a recent report of the Austrian Government on the Vienna Exhibition, we gather the

following interesting particulars respecting the increase of means of communication in various parts of the globe, during the last six years. Lines of telegraph wire have increased from 57,166 to 77,000 geographical miles, and a complete line now runs from San Francisco across the continent of America and the Atlantic, through Europe and Siberia, to the mouth of the Amur on the eastern confines of Asia; while branch lines connect India, Japan and Australia. The mileage of railways has increased during the same period from 24,500 to 37,300 miles; and a calculation has been arrived at that no less than four millions of people are daily conveyed by this species of locomotion. By means of the postal service it is calculated that 3,300 millions of letters circulate annually, or about nine and a quarter millions a day, or 100 a second. In 1860 the value of the exports and imports over the face of the globe, amounted, according to an Austrian statistician, Herr Kolb, to about 15,000 millions of florins, or 1,500 millions sterling; while ten years later, according to a French calculation, it had increased to 23,170 millions of florins, or no less than fifty-four per cent.

JULES JANIN.

It was not only around the grave of Jules Janin, "homme de lettres," as he was ever pleased to call himself, that poets, Academicians, scholars, statesmen, journalists, and comedians, assembled in the morning of last Monday. It was the grave of French criticism, the tomb of that wholly modern art of dissection and analysis that spurs and inspires all others, and which in France appears to be dwindling into bald descriptions and spiritless summaries. Jules Janin and Théophile Gautier lost, there remains no dictator in literature, no supreme judge, scarcely an examiner, save perhaps the pale copy of both—M. Paul de Saint-Victor. The old fearless fanatic lovers of art of the Romantic period, the enthusiasts who would walk through a city alive with revolution to witness a promising *première*, who cut the damp leaves of a new book reverently and amorously—these have disappeared in rapid succession, and their place is likely to remain vacant. Gustave Planche, the greatest, was the first to go; then followed Sainte-Beuve, Théophile Gautier, and Saint-Marc Girardin. Lastly, he who was popularly considered to overtop them all, died a week ago at that sunny villa at Passy, whence bulletins of health had been issued for many months past. The race is extinct for the present: the last man of letters has departed. And, brilliant as the literary era closed by the Empire was in some respects, it was something to remain a man of letters, pure and simple, in the atmosphere of delicate bribery, of fascinating corruption, formed, as it were, by the smoke of fusillades of the *coup d'état*. While poets, professors, journalists, were seeking, or at any rate accepting, sinecures as librarians of libraries that only existed in castles in Spain, as secretaries to gentlemen whose correspondence consisted in *billets doux* and police reports, while unfortunately many of the hands that had penned some of the masterpieces of modern French literature were fumbling furtively in Caesar's privy purse, Jules Janin remained the critic of the *Débats*, accepted Béranger's advice, "No dois rien." This should be kept in mind by whoever judges his life and works. Courted by Imperialists and Orleanists, he maintained a literary integrity that no champion of either side has ever attempted to assail. His cringes and congées were performed to pet writers, never to political patrons. He spoke bold praise of Victor Hugo at a time when to render justice to the author of the *Châtiments* was to insult the author of the *Vie de César*.

The early pages of Jules Janin's biography are blurred and doubtful. He was born at Saint-Etienne in 1804. "Oh, mil huit cent quatre! la belle époque pour naître!" he wrote with characteristic egotism in one of his prefaces. The sound

classical education he was accustomed to prove rather too frequently and emphatically in the columns of the *Débats* was obtained at the Lyceum of Lyons. In his preface to the *Contes Nouveaux*, Janin narrates how, at fifteen, a prodigy of learning, he was sent to Paris to complete his studies at the Lycée Saint Louis. His father, a provincial barrister, was poor, and an old aunt, of whom Janin makes frequent mention in his letters and autobiographical sketches, offered to defray the expense of a Parisian education. A curious ménage was installed on the heights of the Latin—a young, undisciplined, pleasure-loving student, an old provincial bourgeoisie, with one idea, one aim—the happiness, the glory of her “cher Jules.” The exile of Saint-Etienne, however, made but a poor figure at Saint Louis, where his rivals were Boitard, Lerminier, Sainte-Beuve, and Lacenaire, the poet murderer, the “Manfred du ruisseau,” as Gautier called him. Janin took no prizes. He was classed among the ne’er-do-weels. “Il faisait de l’Opposition!” Burnouf, his professor, said. He was liberal, with vague Bonapartist leanings, like all the Young France of the Restoration, and complained bitterly that the sword and musket Napoleon had placed in each lycéen’s hand was thrown aside under Louis XVIII. for a crucifix and a breviary. On leaving college he seems to have occupied for some time a stool in a solicitor’s office. But the salary of a lawyer’s clerk was scarcely a month’s revenue for the spendthrift gourmet who was to develop into the editor of the “*Classiques de la Table*” and the President of the Bacchanalian Caveau. He became a private tutor, giving lessons at five francs an hour “in all the sciences I knew nothing about,” as he subsequently confessed. His temporary profession seems to have yielded considerable profits, for, according to the critic’s own account, his life at that epoch was anything but an ascetic one. With his dog Azoc, with the *grisettes* he has sung with hyperbolic effusion of tenderness, the tutor found time to pay riotous Bohemian visits to Romainville, to sup at Véfour’s in gallant company, and distinguish himself at the most notorious barrière balls. His was not a severe scholarly experience; it was an education to fit a man for the easy composition of dessert ditties, rather than the shrewd and elegant criticism of forty years’ literature. His pupils fell away from him every summer, and Janin was obliged at these periods to do penance on homely fare, and in solitude, for the self-indulgence of his seasons of prosperity. He read much during these long lenten days, and curiously enough, his favourite author was Geoffrey, the critic of the First Empire, a very Jeffrey, who denied to the last that Talma was anything nobler than a mountebank. This reading suggested to the pupilless tutor an expedient for setting himself once for all beyond the reach of poverty. He would keep the wolf from the door with a paper barricade—become a journalist. A former schoolfellow presented him to the staff of an insignificant theatrical publication, *La Lorgnette*, and Janin received the Ambigu Comique as his sphere of dramatic criticism. He contributed to the *Lorgnette* during eight months. “It was,” he says, “an acrid, bilious sheet. Every day there was a new sarcasm, a new subject of violent indignation. We were all vindictive without hatred, and cruel without knowing it.” At the end of this obscure apprenticeship he passed over to the *Figaro*, which had just been started, and which owes a great part of its early success to Janin’s jovial and aggressive spirit. Here his Orleanist sympathies found free vent. When the Duc de Montmorency was received a member of the Academy, Janin composed a laughable parody of the *discours de réception*, and signed it “Le Duc de Montmorency.” The Duke complained: Janin was ready with an ingenious explanation. He avowed gravely that the fact of the Duke’s election was unknown to him. The burlesque *discours de réception* was that of a Montmorency wine merchant who had just become a *membre* of the

local literary institute. *Barnave* was a retraction, a violent satire on the house of Orleans, albeit M. Janin proclaimed his consistency in these lines: “L’Opposition a été ma vie à moi, comme à d’autres la défense du pouvoir est leur vie. Le premier qui a jeté des paroles d’opposition après Juillet, et qui les a signées, c’est moi.” But the critic forgot to add that before July he prepared and demanded the Revolution. At the time of his engagement on the *Figaro*, Janin published his most celebrated romance, *L’Âne Mort, ou la Femme Guillotinée*. It has always remained doubtful whether this extraordinary composition was designed as a serious literary essay, or as a caricature of the Romantic style. The Romantics accepted it as a profession of faith, and hailed the author as a convert, a new-born fanatic. He was even asked to collaborate in that typical Romantic drama, the *Tour de Nesle*.

Janin’s second novel was *La Confession*, a philosophical story worthy of Diderot, and probably suggested by him. Then followed *Barnave*, 1831; a volume of *Contes Fantastiques* and *Contes Littéraires*, 1832; *Contes Nouveaux*, 1833; a series of tales of all countries, begun in 1833 and concluded in 1835; the *Chemin de Traversée*, which is in a great measure a picture of the author’s early experiences, 1836. During all these years his pen was busy in a number of periodicals. He passed from the *Figaro* to the *Quotidienne*, thence to the *Messenger*, and finally to the *Débats*, where without intermission the weekly *feuilleton* bearing the famous initials “J. J.” appeared during forty years. Insensibly, as fame and fortune came to him, his style changed, his task refined, and at the same time grew less exclusive, less subservient to personal and political likings and antipathies. The critic of 1840 was a hard and bitter censor. Jovial companion as he was, he never forgave a slight, an indignity. The gaiety with which he dissected an enemy was the bitterest part of the punishment. He was never in earnest, never held a victim worth the executioner’s serious ire. He struck *en passant*, and humming lightly went his way. Latterly, however, when his throne was assured, he became *bon prince*—Prince Charmant, Louis Ratisbonne averred in his funeral oration. He was at his ease in that terrible *feuilleton*, that Gautier called a kennel, “en bas du journal.” He gave reins to his vagabond fancy, despatched the new comedy, the new poem in a few gracious words, and roamed where he listed, said what he chose, and quoted when he chose to say nothing. The charm of the literary mosaic thus composed needs no demonstration. It has been felt wherever Jules Janin’s name is known.

The critic had a few rude literary jousts, however, and was not invariably victorious. In his youth he was an intimate friend of Félix Pyat, but having given a political colour to an essay on Joseph Chenier in the *Débats*, the author of the *Chiffonniers* chose to consider the article as a direct provocation. He answered roundly in a pamphlet entitled *Chenier et le Prince des Critiques*, which contained several gems of abusive eloquence like this:—

“A man is cowering in the gutter, dragging himself along, his two hands in the mud, and bespattering you. You approach him angrily, and see that he is maimed, is but a helpless trunk, and pitying, you stretch out your hand to him to help him from the filth. Well, here is another, crouching monstrously in his *feuilleton*, using his pen to soil and spoil all that is good and beautiful, to bespatter all that is pure, to revile all that is great. You approach to chastise him: you seize him by the body, and you feel nothing beat under his ribs—nothing, on either side, nothing. Well, he also is maimed, infirm, incurable, ten times more to be pitied than the other: he has no heart.”

For this piece of prose M. Pyat was, on Janin’s complaint, condemned to two years’ imprisonment. Nestor Roqueplan, the wit, the gay paradoxical author of *Parisine*, was another relentless opponent of Jules Janin; and M. Jacquot, *alias* De

Mirecourt, made him the subject of one of his most uncompromising libels. Once, at least, in his life the critic excited all Paris against him. In an article of ten columns, in 1841, he informed the world that he was about to marry, described his future wife, debated the question of Marriage versus Art, quoted the letters of felicitation he had received—one from Chateaubriand, another from Lamartine, a benediction from the Archbishop of Paris, etc. The indecency of these confidences raised a general chorus of hisses, and for a fortnight the Prince des Critiques was unpopular.

Jules Janin leaves behind him abundant evidences of his industry and versatility. Few of his works, save *L’Âne Mort*, *Barnave*, *la Confession*, and the *Gaietés Champêtres*, have become at all popular. Janin was essentially a *feuilletoniste*, he could connect nothing, fill no broader frame than those few columns of the *Débats*. After the works above named, the best known among the fifty-eight volumes signed by him are, *Un Cœur pour Deux Amours*, *le Prince Royal*, *Un Hiver à Paris*, *L’Été à Paris*, *Clarisse Harlowe*, *la Religieuse de Toulouse*, and a translation of Horace, which was his labour of love. More than a year ago the intellect that found rest in it was to all intents and purposes extinct. A monstrous obesity, against which Janin had been battling for the last fifteen years, appears to have stifled his faculties one by one. His last published work is *Paris et Versailles il y a Cent Ans*, which followed at a year’s interval some uninteresting sketches of the provinces after the war. I believe that a considerable portion of the memoir on which the critic was engaged had been saved from the *auto da fé* he made of all his manuscripts some eight months ago. A collection of his chief dramatic criticisms has been published recently under the title *Histoire de la Littérature Dramatique*. In addition to these works, Janin is said to have written more than a hundred notices and prefaces, and to have been an active contributor to fourteen periodical publications. EVELYN JERROLD.

CORRESPONDENCE.

EVE AND THE RIB.

Oxford: June 22, 1874.

I have read with great interest the important remarks of Professor Kleinert in the ACADEMY of June 6, on a possible connexion between the name of Eve and an ancient pre-Semitic word for rib. I do not say that I feel convinced, but I should not be surprised if further researches in Babylonian language and mythology were to confirm the bold conjecture of the learned theologian. Professor Kleinert was not unaware of another solution of the riddle, which Mr. Stanley Lane Poole suggests to him at the end of his letter (ACADEMY, June 20). Mr. Stanley Lane Poole thinks that the reason why the rib in particular was chosen for the honour of forming the first woman was, that Adam could more easily spare a rib, than the bone of a leg or an arm. This was the very solution which I had ventured to hint at in my *Introduction to the Science of Religion*, p. 47: "Let such an expression as 'thou art bone of my bone, and flesh of my flesh,' be repeated for a few generations only, and a literal, that is to say, a material and deceptive interpretation would soon spring up, and people would at last bring themselves to believe, that the first woman was formed from the bone of the first man, or from a rib, for the simple reason, it may be, because it could better be spared than any other bone." It was against this very explanation, which seemed to him and to other theologians to smack too much of the old rationalising school, that Professor Kleinert advanced his rhemato-mythological explanation.

MAX MÜLLER.

SCIENTIFIC PHOTOGRAPHY.

8 Altenburg Gardens, Clapham Common, S.W.:
June 20, 1874.

Looking over the Schliemann, and some other almost equally bad recent photographs, I can only believe that scientific men to whom photography would be useful are hardly aware that it is so simplified by recent practical discoveries, as to put it quite within the power of any tourist or student of archaeology, geology, or any other science in need of illustration, to carry in the compass of a foot cube all the apparatus and material needed, and to learn (with average common sense) all the operations involved in the simplest forms of the art in two or three hours' application.

I should be most happy to put any student of science in the way of judging of the truth of what I say, without any further expense or trouble than is involved in a visit of an hour, any bright day when I am at home. This certainly is a subject on which "they who have light should impart it," and I shall be only too happy to put what I know at the service of science.

W. J. STILLMAN.

CHAUCER'S "JAKK OF DOVERE."

London: June 23, 1874.

In the "Cokes Prologue" "oure host" says to the "coke":—

"And many a Jakk of Dovere hastow sold,
That hath be twyes hoot and twyes cold."

Tyrwhitt and Thomas Wright confess that they do not know what a "Jakk of Dovere" means, and Bell can only think of the jack fish, saying that "Dover may have been celebrated for them"! Is the following attempt at explanation any better than Bell's?

Thomas Bitton, Bishop of Exeter, who died in A.D. 1303, had a cook named John of Dover. This cook was so much esteemed by the bishop (of course, *qua* cook) that he left him a legacy of 40 shillings by his will (i.e. at least 60*l.*). (See page 33 of the Accounts of the executors of this

bishop, just delivered by the Camden Society to its members.)

Now the bishop was a peer of the realm, had his palace in London, came up there periodically, and brought his *chef* with him; and this John of Dover, profiting by his opportunities, may have made himself a fame in London for some masterpiece of his art, called by the Londoners from his name a "Jakk of Dovere." HENRY C. COOTE.

THE AUXILIARY "DO."

3, St. George's Square, N.W.

Dr. Richard Morris, in his excellent *Historical Outlines of English Accidence*, p. 192, says that "Lydgate is the earliest writer I know of, that uses the modern construction of *do* and *did* as tense auxiliaries." But I find *did* thus used, and that often, nearly 100 years before Lydgate (1400–1440), by Robert Manning, of Brunne, who in the first part of his *Chronicle* (A.D. 1338), which I am editing for the *Rolls Series*, says that Geoffrey of Monmouth translated his *Chronicle* from Breton:

"fro Breton speche he *did* remue, (164)
& made it alle in Latyn."

Again, when Octavus gives his daughter to Maximian, Manning says:—

"Of his daughter he *dide* hym sese, (6388)
Wip al þe reome ilkadel . . .
Conan was wroþ . . .
Octavus, his em, he gan manace,
& Maximien wip werre *did* chace, (6394).

These are clearly instances of the auxiliary, and not the usual early causative use of the verb. That the auxiliary use sprang naturally, as well as historically, from the causative use, is clear, from the maxim, *Qui facit per alium, facit per se*, from such passages as the following:—

"Men of gode zede beym amonge,
Dide þem acorde in loue & pes, (6403)
He *dide* somonne alle his barons, (6423)
Awey to chace, & felle, þe Bretons.
Tentes & pavilions he sette,
Engyns *dide* make & fette (14622)
Þenne *dide* he [Arthur] scke alle þe Bretons,
Erles, knyghtes, & barouns, (13986)
& *dide* þem cario to þer contres . . .
He tok þe body of þe Emperour,
& *dide* hit kepe at gret honour,
& sent hit to Rome to do in graue."

Can any reader produce instances of the auxiliary *did* or *do*, before A.D. 1338?

F. J. FURNIVALL.

ENGLISH SURNAMES.

Norton Canon: June 22, 1874.

Although an interest in English family names is very generally felt, and much has lately been written on the subject, we are still a long way from possessing any systematic treatise of real authority. No attempt, so far as we know, has yet been made to localise names, though few can have failed to notice that the nomenclature of a district is often as distinct as its physical features. Of course we are all aware that

"By Tre, Pol and Pen,
You may know Cornishmen,"

and that Wales abounds in patronymics of the simplest sort to a very embarrassing extent; but it is probable that a little research would enable us to assign a vast number of our family names to particular divisions—in some instances to particular counties—of England. Thus, among the lower and middle classes of Herefordshire the most prevalent names are, as might be expected, Davis, Evans, Bevan, Preece, Price, Pugh, Pye, Williams, Willym and Guillim, Jones, Harris, Tomkins, Watkins, Probert, Roberts, Prichard, Richards, *et hoc genus omne*. The bearer of any one of these

names possesses only a very vague clue to his local origin, but it is otherwise in the case of those names which are derived directly from places within the county, as, for example, Brimfield, Bodenham, Hargest, Hereford, Kinnersley, Lingen, Llanwarne, Pembroke (and Peimber), Ross, and Whitney. All these are names which occur in Herefordshire frequently, and perhaps most of them may be termed indigenous. A third class comprises names identical with those borne by ancient lords of the soil, and implying that their present owners are more or less remotely connected with those lords. Examples of this class are becoming rare, but we still meet with the following: Baskerville, Dabittot, Dillehay (and Delahay), Delabere (spelt variously), Savaker and Savigay (from Sanacre), Skidmore or Scudamore, and Pantall (which seems to be a corruption of Pantulf). Lastly, there are certain names which are common within a very limited district, but do not fall under any of the above heads. Herefordshire affords the following examples, which of course might be increased in number:—Deyos, Galliers, Gomond, Gurmin, Meats, and Pinches. If antiquaries would take the trouble to collect and classify the family names which occur in their parish registers, and in the districts best known to them, some progress might be made towards a scientific treatise on the subject.

C. J. ROBINSON.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, June 27,	1 p.m.	Sale at Christie's of the Collection of Pictures and Drawings of the late J. Cressingham, Esq.
	3.45 p.m.	Royal Botanic.
MONDAY, June 29,	1 p.m.	Sale at Sotheby's of the Collection of Coins, Antiquities, &c., of Mr. C.R. Taylor.
	8 p.m.	Seventh Philharmonic Concert: Madame Essipoff (St. James's Hall).
	"	Mr. Sims Reeves' Benefit Concert (Royal Albert Hall).
TUESDAY, June 30,	3.30 p.m.	Statistical: Anniversary.
	2 p.m.	Royal Horticultural: Meeting of Council.
WEDNESDAY, July 1,	1 p.m.	Royal Horticultural.
	3 p.m.	Madame Nilsson's Concert (St. James's Hall).
	8 p.m.	Obstetrical.
	"	First night of <i>Led Astray</i> at the Gaiety.
	"	Anthropological Institute: Col. Lane Fox on the Principles of Classification in his Archaeological Collection.
FRIDAY, July 3,	1 p.m.	Sale at Sotheby's of Rare and Valuable Prints.
	4 p.m.	Archaeological Institute.
	8 p.m.	Geologists' Association.

SCIENCE.

The Universe and the coming Transits. By R. A. Proctor. (London: Longmans & Co., 1874.)

PERHAPS there is no more reprehensible practice than that, so common at the present time, of reprinting without adequate revision disconnected magazine articles; and though Mr. Proctor's latest book shows more signs of careful correction than is usual in such productions, there is an absence of connected argument which detracts much from the value of the work, whilst unnecessary repetitions severely try the reader's patience. As its title implies, the book treats of two totally disconnected subjects. The first portion is a sequel to those parts of Mr. Proctor's essays on Astronomy which give the author's extremely valuable specula-

tions on the constitution of the sidereal system, and it is much to be regretted that he has not seen fit to present us with a complete treatise on this important subject, instead of leaving his readers to glean their information as best they can. But Mr. Proctor has made the subject so thoroughly his own, that it is well worth a reader's while to devote a little time to the perusal of these essays.

The question of the distribution of the stars is one of great difficulty, and the most we can hope for at present is a provisional theory, which will enable us to co-ordinate phenomena and suggest lines of research, whilst our results will be unaffected by its truth or falsehood. So long as we confine ourselves to laying down the places of stars on maps or charts, we are treading on firm ground; but as soon as we attempt to fix their position in space, we are thrown into the region of speculation. Astronomers of the present day have, however, two points of advantage over Sir W. Herschel and the early students of this question. In the first place, the distances of a few stars are now known with more or less accuracy, and, what is even more important, we have now some idea of our own motion in space, for it is evident that the only means of determining the distribution of objects in space is by shifting our own position with respect to them.

Before the parallax of any star was determined, it seemed reasonable to assume (notwithstanding the existence of binary systems with unequal components) that the fainter stars were on the whole much farther from us; and starting with this assumption, Sir W. Herschel was led, from a consideration of the clustering of small stars about the Milky Way, to conclude that the sidereal system might be represented by a cloven disc, whilst his son preferred to consider it a cloven ring. Sir W. Herschel afterwards modified his views considerably, and finally relinquished this theory, without, however, substituting any other in its place. In fact, it is evident that in the absence of any knowledge as to the real size of stars differing greatly in apparent brightness, we are not justified in assuming that a great condensation of small stars indicates a great extension of the sidereal system in that direction, so that any such figure as Sir W. Herschel gave is really only to be looked upon as a graphical representation of his star gauging. Some of the clusters themselves, consisting as they do of stars of widely different orders of magnitude, afford strong internal evidence that faintness is no test of distance, for it is hardly conceivable that they should be enormously long cylinders or spindles, turned in every case exactly toward us. Now, taking advantage of the additional knowledge which we now have of the stars, and availing himself of the method of graphical representation which has done such good service to science, Mr. Proctor has started a new theory, which is, at any rate, not inconsistent with facts so far, and which may well be accepted provisionally as a guide in further researches. The fundamental idea on which Mr. Proctor's hypothesis is based, is that there are streams of stars of all sizes and in all stages of

formation (including in this category the nebulae both resolvable and irresolvable), which are all moving in one direction, and which, therefore, have some physical connexion; whilst other streams contiguous to those are moving in a different direction. Though this theory is plausible, it must be remembered that the evidence in its favour is but very slight, for a stream is a very elastic term, and by the aid of a little imagination almost any accidental arrangement of stars may be grouped into a stream; but after making due allowance for this, there can be no question that Mr. Proctor's argument acquires some force when it is found that the stars of any one stream have a common proper motion. Dr. Huggins's researches on the motions of certain stars in the direction of the visual line have also been enlisted with some effect by Mr. Proctor on his side, but too much stress ought not to be laid on these extremely difficult observations.

One point it seems to me that Mr. Proctor has established with some clearness, viz., that stars of all orders of magnitude are to be found physically connected, and this is, no doubt, a great step gained. Though many astronomers have long inclined to this view, Mr. Proctor has the merit of having summed up the evidence in its favour with great care and completeness, and especially of having skillfully applied the doctrine of chances to the recently determined proper motions of stars of different magnitude. With regard to the distribution of nebulae, Sir J. Herschel long ago remarked that they were grouped chiefly along a great circle perpendicular to the Milky Way, and Mr. Proctor now supplements this by pointing out that they are markedly deficient along a zone nearly coincident with the Galaxy, and these facts are well brought out in the charts by Mr. Sidney Waters, given in this work. Our knowledge of the nebulae is still so limited that it seems to me premature to speculate on the cause of this distribution; at any rate, I feel great difficulty in understanding how the balance of attractions in the Milky Way could check the clustering power, and prevent a cluster from being condensed into a nebula in the way suggested by Sir W. Herschel, and adopted by Mr. Proctor. But, as I have previously intimated, the constructive part of Mr. Proctor's work is based on a somewhat insecure foundation, and, in fact, the whole subject lies at present rather in the region of metaphysical speculation than in the domain of scientific enquiry.

A few words must suffice for the second portion of this book, as no useful purpose can be served by discussing a question which is already decided. The recently published report of the *Challenger* furnishes a complete reply to Mr. Proctor's attacks on the officers of the Admiralty and on the Astronomer Royal. The greatest difficulty has been experienced by Capt. Nares in approaching the Antarctic Circle, and after encountering serious risk, he has discovered that no land whatever exists in the neighbourhood of the chimerical stations for which Mr. Proctor has been at the pains to calculate the circumstances of the Transit of Venus. From the first, the selection of stations has been a purely practical question,

though Mr. Proctor has failed to recognise this; but I presume that even he would hardly propose that a party of British astronomers should attempt to land their instruments on an iceberg. On the strength of the report from the *Challenger*, the Germans have at once given up the idea of occupying Heard Island.

It is difficult to understand by what train of reasoning Mr. Proctor has persuaded himself, and has attempted to persuade the general public, that his plans have been adopted; in an article on the Transit of Venus, in the *ACADEMY* for March 28, I have sufficiently explained how completely the Astronomer Royal has adhered to his original programme, which was the subject of Mr. Proctor's attacks from the very first.

There is one more point, on which Mr. Proctor lays much stress, but which admits of ready explanation. The Astronomer Royal suggested the occupation of an Antarctic station in 1882, under the impression that a stay of a few hours only would be sufficient; the naval authorities afterwards informed him that it would be necessary for a party to winter there, and in view of the risks to which they would be exposed, he declined to recommend such an expedition to the Government. W. H. M. CHRISTIE.

The Former Linguistic Unity of the Indo-Germanic Races of Europe. [*Die ehemalige Spracheinheit der Indogermanen Europas: eine sprachgeschichtliche Untersuchung.* Von August Fick. (Göttingen: Vandenhoeck und Ruprecht's Verlag, 1873.) Pp. vi. 432. 8vo.]

FOR the sake of those readers of the *ACADEMY* who have not the time to watch closely the current of philological enquiry, it will not be out of place here to state that the above book owes its origin, mainly, to the publication a short time ago, by Johannes Schmidt, of a very clever little work, entitled *Die Verwandtschaftsverhältnisse der indogermanischen Sprachen* (Weimar, 1872), in which he makes an attack on the genealogical classification of those languages. The latter, as it stands in the work before us, and as it is now generally received, is to the following effect:—The ancient Japhetic nation, otherwise called Aryans, Indo-Europeans, or Indo-Germans, divided itself into Aryans and Europeans: the former subdivided themselves into the nations of India and of Iran, and the latter into a northern and southern branch. Of these, the former branched into the Teutonic nations and the Letto-Slaves (whence the Lithuanians and Slavonians), and the latter into the Celtic and the Greco-Italic nations (whence Greeks and Italians). Now, Schmidt objects to the idea of a genealogical tree *in toto*, and proposes in its stead a kind of geographical basis of classification, which will be best appreciated when laid before the reader in his own way, as follows:—

“The metaphor, also, of a plane inclining in an unbroken line from Sanskrit to Celtic seems to me not unsuitable. As to linguistic boundaries within this area, originally there were none. Two dialects, A and X, situated at any distance you please from one another, stood connected by continuous varieties, B, C, D, &c. The appearance of linguistic

boundaries—or, to abide by our metaphor, the transformation of the inclined plane into a flight of steps—I regard in my own mind as that which took place when a race or stock speaking, say, the variety F, gained, as the result of political, religious, social, or other conditions, the upper hand over its nearest neighbours. By these means the linguistic varieties G, H, I, K, in the one direction, and E, D, C, in the other, were suppressed by F and supplanted by it. This having taken place, F bordered immediately on B on the one side and on L on the other; these sides, with their intermediate varieties, having been in the one instance raised, and in the other lowered, to the level of F. Thus well-defined boundaries had been drawn between F and B on the one side and between F and L on the other; that is, a step had taken the place of the inclined plane. Such a thing, we need hardly say, has often enough happened in historic times. I will only mention the ever-growing power of Attic Greek, gradually thrusting the dialects altogether out of the written language; the language of the city of Rome stifling all the other Italian dialects; and modern High German, destined perhaps to complete, at no distant date, the like extinction of the German dialects."

This is ingenious, but would, had we to accept it, tend to tie the hands of the student of comparative philology, who has been in the habit of regarding as proved the genealogical connexion of the various Japhetic languages: substitute for this their mere juxtaposition, together with an indefinite original relationship, and the field of philological enquiry is robbed of its subsoil and, with that, of its prospect of bountiful harvests of future results. For, as Schmidt says (p. 28), you no sooner consign to the realms of myth the so-called original languages constructed in modern times, such as the European, North-European, Slavo-Germanic, South-European, Greco-Italic or Italo-Celtic, than the mathematical certainty disappears, which was believed to have been already attained for the work of reconstructing the Indo-Germanic mother-speech.

Now, the brunt of Schmidt's logic is directed against the Letto-Slavic branch of the genealogical tree. Agreeing with other scholars that the languages in question are nearer akin to the Germanic than to any other European tongues, he attempts to show that neither can they, on the other hand, be severed from the Aryan family of speech, any more than we find Europe and Asia separated by well-defined landmarks in a geographical sense. This he rests mainly on the striking coincidence in the reduction of Japhetic *k* in certain words into a sibilant—that is, where in the Aryan languages it becomes *ç* on the one hand, and *sz* (= English *sh*) in Lithuanian and *s* in Slavonic on the other,—as, for instance, in Skr. *çata*, Lith. *szimta-s*, O. Bulg. *šito*, Gr. *ἑκατόν*, Lat. *centu-m*, Welsh *cant*, Eng. *hund-red*. Now the coincidence, of which we have here given only one instance, it is agreed on all hands, cannot be the result of accident; nor is it attempted to show that Schmidt's conclusion does not naturally flow from his premises. But his way of reasoning had been foreshadowed some time ago in Ascoli's *Corsi di Glottologia*, and so, in fact, had the answer to it (as will be seen by anyone who will take the trouble to turn to page 56 of that work), although it remained to be laid *nettement posé* before the general reader by

the clear-headedness of M. Havet in the *Revue Critique* for Nov. 23, 1872, and to be worked out at length by Dr. Fick in the work before us. It turns out, then, that all is not right with Schmidt's premises; for instead of a *k* in the Japhetic mother-speech, "il est certain," as Havet has it, "qu'il y avait un *k*, et un *k*," which Ascoli writes *k'* and *k''*. Here they will be represented by *γ* and *k*, or *γ* and *k''*, for it would seem that *k* was represented by *k''* in the common language of the Japhetites of Europe in all instances. Thus from a Japhetic *deçan* we have Skr. *daçan*, O. Bulg. *desen-ti*, Greek *ἑκα*, Lat. *decem*, O. Welsh *dec*, Gothic *taihun*, Eng. *ten*; whereas from *katvar* the forms are Skr. *catvar*, Lith. *ketur-i*, Gr. *τέτταρες*, *τέσσαρες* and *πίρρες*, Lat. *quatuor*, Welsh *pedwar*, Goth. *fidvor*, Eng. *four*. That is to say, instead of reasoning from the supposed agreement of certain languages in capriciously treating one and the same sound in two ways to their common descent, we start from their agreeing, or nearly agreeing, in treating one sound uniformly in one particular way; and, as this may be merely fortuitous, we fail, of course, to arrive at the former conclusion, not to mention that there are on the other hand good reasons for ranging the Letto-Slavic languages with those of Europe and not of Asia; so that, so far, the genealogical tree may be said to stand intact and unshaken. Of course everything here depends on establishing the existence in the mother-speech of *γ* and *k*, and Dr. Fick spares no pains to do so: in connexion with this we may add that the second chapter of the present book, occupying no fewer than seventy-seven pages, is made up of lists of words showing where *γ* and where *k* occurred in the common vocabulary of the Japhetites of Europe, which may be regarded as an important improvement on the author's *Vergleichendes Wörterbuch*, where they had been promiscuously given. Returning to the first chapter, the reasoning, which I have just tried to sketch, is supplemented by vocabularies of all the words hitherto supposed to be common only to Teutons and Aryans and to Letto-Slaves and Aryans; and whereas Schmidt found them to be fifteen and sixty-one respectively, Fick sets them down as eighty-two and sixty-five, maintaining that his opponent went to work on different principles in the formation of the two lists.

Owing to the great regularity with which Welsh distinguishes between the representatives of *γ* and *k* (or *k''*), a good deal of the discussion in the first chapter of the present work had to be carried on on Celtic ground, but we have expected Dr. Fick, who had hitherto invariably fought shy of τὸ Κελτικόν, to gird himself for this part of the field. However, he has done so, and, on the whole, acquitted himself very creditably; but I cannot resist the temptation to call attention here to two or three minor points. He confesses his ignorance as to whether the rule, that *k''* (Latin *qu*) should become *p* in Welsh, obtains without any exceptions. Unfortunately it does not: witness the words *cam*, "crooked," from *KAM*; *clledyf*, "sword," from *KALDA*; *cos-i*, "to itch," from *KAD*, *KANDATI*; *carw*, "stag," is not to be added, as being possibly a Latin loan-word. O. Welsh *pui*, Irish *cía*, is not exactly to be

equated with Latin *qui-s*; for it reflects letter for letter the Latin *qui*, *quae*, as explained by Schleicher, for *quo-i*, *qua-i*. As to *coqu-o* and *quinque* having been formed from **poqu-o* and **pinque*, it is quite enough to have to accept this kind of assimilation once, and it is too much to be asked to admit it also in the case of the O. Irish *cóic*, "five," for **cóinc*. Now, if these words had *p* as their initial in the common language of the Celts before their separation, it ought to have entirely disappeared in Irish and Welsh; but the latter still has *pob-i*, "to bake," and *pump*, "five," so we are driven to postulate the Italo-Celtic forms *k'ak* and *k'enik'a*.

It has been usual to divide the Celts into Goidilic or Irish on the one hand and Gauls and Britons on the other, owing mainly to the fact that the Celts of Britain and Gaul agree in using *p* for European *k''*, whereas the Irish reduce it to *c*. Hitherto, however, a near relation has not been asserted between us Welsh and the Italians who said *pis* for Latin *quis*, or the Greeks who said *πίρρες* where we use *pedwar*, "four;" nor, as far as I know, has a counter-classification been based on the fact that Irish and Gaulish agree in using *s* where we have *h*. The nature of the chief argument Fick has to deal with in this work ought to have made him hesitate to speak of Irish and Gallo-British Celts; on the other hand the gulf between archaeologists and philologists in this country is a sufficient excuse for his ignorance of the fact that the earliest representative of *k''* is not *p* in Wales and *c* in Ireland, but *q* or *qv* on both sides of the Irish Sea, as attested by our most ancient inscriptions. It would, perhaps, be not too much to say that the Celts of Wales had no *p* in their language up to the end of the fifth century; the first sure instance of its use occurs in Gildas' *Vortipore* in the middle of the sixth century, and even then *q''* had probably not gone entirely out of use in such forms as *mag'i*, later *map* and *mab*, "son," Irish *mac*; nor did the ogmic alphabet which they used recognise it, until a special symbol for it had to be invented in the case of Roman names with *p*: witness the bilingual stone of Turpillus at Glanusk Park near Crickhowel. Let us hope that the time has come for the Irish and Gallo-British Celts to wheel about into harmony with geography into continental and insular Celts.

In his third chapter our author discusses the position in which the Greeks stood with respect to the Aryans, and supplements his remarks with lists of words common only to Italians and Aryans and to Greeks and Aryans, which he makes out to be 65 and 108 against the 20 and 99 which Schmidt had found; it is right to say that both are agreed in attributing the excess in favour of the Greeks, partly to the fact of their having committed their language to writing much earlier than their kinsfolk in Italy. Having thus tried to dispose of the alleged merging of the languages of the Letto-Slaves and of the Greeks into those of Iran, the author proceeds to prove in the next chapter the unity among themselves of the Japhetites of Europe by calling attention to a number of nouns which appear under different forms in European and Aryan languages. The two succeeding chapters are devoted to the discus-

sion of the development of *e* and *l* in the former: both are accompanied with very valuable vocabularies. In the seventh chapter we have a sketch, after the manner of Pictet in his *Origines Indo-européennes*, of the state of the ancient Japhetites as gathered from the evidence of language, which appears, possibly, more meagre than it need as far as concerns agriculture, if we may venture to throw into the scale the probable identity of the Welsh *haidd*, "barley," and Skr. *sasya*, Zend *hakya*, "corn." Then follows a similar sketch of the European branch, showing considerable progress in vocabulary, which is assumed to be the index of corresponding material progress realised since its separation from the original stock. The list appended of words belonging in common to the Japhetites of Europe, and unknown to the Aryans, takes up ninety-nine pages, which will serve as a revised edition of the corresponding portion of the author's Dictionary. In the eighth and last chapter, before recapitulating, he disposes of all temptation to regard either the Scythians of Herodotus or the Phrygians and Thracians as forming connecting links between Aryans and Europeans, the former being shown to belong in a pronounced degree to Iran, and the latter to Europe.

Finally, the entire work, though inadequately corrected for the press, may be characterised as a merging into one volume a future edition of the author's Dictionary and Pictet's great work posted up to date, with a polemical tinge imparted to the whole.

JOHN RHYS.

The Pedigree of the Masoretic Text of the Old Testament. By A. Kuenen. (Amsterdam, 1874. Reprinted from the Transactions of the Royal Academy of Sciences.)

At the June meeting of the Dutch Academy of Sciences, a paper was read by Professor Kuenen on a hypothesis of Professor de Lagarde relative to the archetype of all Old Testament MSS., which appeared in the *Götting. gelehrte Anzeigen* for 1871, and excited some attention in the learned world. The hypothesis was noticed briefly by myself in the ACADEMY for August 15, 1871, where I remarked that it was "not at all impossible that this passage" [from an Arabic text, full of anachronisms, on which Professor de Lagarde bases his hypothesis] "may contain a kernel of truth." The tradition referred to is to the effect that after the capture of Bithur, the last refuge of Bar Cochba, in A.D. 135, the principal Jews fled to Bagdad (Babylon). They took with them the Thora (i.e. a MS. of the Old Testament), of which they caused copies to be made, and sent out from Bagdad to all Jewish communities. But the text was no longer in its original form. Even before the capture of Jerusalem by Titus, the high priests Annas and Caiaphas had made an alteration in Genesis by subtracting 1,000 years from the total of the ages of the patriarchs, so as to be able to deny that Messiah had appeared. And this corruption has consequently made its way into the MSS. of the Hebrew text. It seems to be based upon a Jewish prophecy that Messiah should appear five days and a half (i.e. 5500 years) after the Creation.

the ages of the patriarchs, the priests were enabled to assert that Jesus of Nazareth could not be the promised Messiah, because a long period had still to elapse before the fulfilment of the prophecy.

The arguments of Professor Kuenen, in the pamphlet at the head of this article, have convinced me that my former view expressed in the ACADEMY was erroneous, so far as my acceptance of the falsification of the Hebrew text is concerned. The prophecy that Messiah should appear in the year 5500 of the Creation is almost certainly not older than the third century of our era; whereas the numbers in the Masoretic text existed in the time of Josephus, and probably earlier. This is successfully maintained by Professor Kuenen in sections 2 and 4 of his pamphlet. In section 3 he tries to show that such an alteration of the ciphers as Professor de Lagarde supposes can never have been an object with Jewish apologists. At least, it would have been very imprudent to alter them in such a way as to fix the birth of the Nazarene exactly in the year 4000.

But the question remains, does the rejection of the latter part of the Arabic tradition involve that of the former, i.e. of the assertion that the current Hebrew MSS. are derived from copies of the single MS. brought from Bithur to Babylon? It is true that the narrative in which this assertion occurs is replete with errors and anachronisms, though Professor Kuenen is not quite accurate in stating (p. 7) that "Annas and Caiaphas are made contemporaries of the event, i.e. placed thirty or forty years too late." In the Arabic it is only said that the alteration of the text took place before the conquest of Jerusalem by Titus. And Professor Kuenen treats the anachronism, Bagdad for Babel, more severely than it deserves. But it is difficult to find any better explanation of the fact, that while different recensions of the text were still in existence in the first century A.D., or, as Professor Kuenen says, "the period of free handling of the text and of growing licence" was not yet past, the Masoretic text was the *textus receptus* at least as early as the third century. How and when was it raised to this eminence?

Professor Kuenen states his opinion thus (p. 43 foll.):—

"The view that the first MS. which came to hand, corrected here and there in the most arbitrary way, was constituted the standard copy is without any reasonable foundation. We may also bring this negative result into the form of a positive proposition thus: the Masoretic text is the product of a selection from the existing material. When I add of a selection not infrequently intelligent and successful I am not going beyond facts."

I reply to this, that the Arabic passage referred to contains no such expression as "the first manuscript that came to hand." On the contrary, by the Thora—first of all brought by the priests from Jerusalem to Bithur, and from thence conveyed by the principal Jews of the family of David to Babylon—the writer evidently means the unique copy used in the temple. The tradition knows nothing of accident in the choice of the manuscript for the standard text, or of any other arbitrary corrections than the chronological. Moreover, the as-

sertion that the Masoretic text is the product of a definite selection seems to me incapable of any positive proof. At any rate, the substitution of this for all other recensions requires explanation. And really there is none which so recommends itself in all respects as that of the Arabic paraphrase.

Although Professor Kuenen has proved that the charge of corruption of the Hebrew text in the interests of the Jews as against the Christians is false, the problem of the difference in chronology between the Hebrew, the Greek, and the Samaritan version is still unsolved. Professor Kuenen is the first to admit this, though he evidently inclines in favour of the Masoretic text in this as well as other respects. But the possibility at least remains that the system of the LXX. deserves the preference—i. e., stands nearer to the original one—and consequently that, with reference also to the alterations in the Hebrew text, the language of the Arabic paraphrase contains a kernel of sound tradition, though connected with an utterly distorted explanation.

A Swedish scholar, Mr. Rydberg, has attempted, according to Lieblein (*Recherches sur la Chronologie Egyptienne*, p. 9, &c.), in a work entitled *Urpatriarkenens släkttafla i Genesis* (Göteborg, 1870), to prove that the chronology of the patriarchal period is constructed according to the system of the ancient Egyptians. If this proposition, which I do not feel competent to criticise, should turn out to be true, the ciphers of the Hebrew text on which it is founded have gained an incontrovertible witness to their originality, Mr. Rydberg's calculation being entirely inapplicable to the Greek text.

M. J. DE GOEJE.

NOTES AND NEWS.

The Intracellular Development of Blood Corpuscles in Mammals.—At the meeting of the Royal Society, March 19, Mr. E. Schäfer contributed a paper, of which the following is an abstract (*M. J.*, June 1). He says that if the sub-cutaneous connective tissue of the new-born white rat is examined under the microscope in an indifferent fluid, it is found to consist chiefly of an almost homogeneous hyaline ground-substance, which is traversed by a few wavy fibres, and has a considerable number of exceedingly delicate more or less flattened cells scattered throughout the tissue. The cells here spoken of are, of course, the connective tissue corpuscles. Their branches as a rule are few and short, and they are mainly distinguished by the extraordinary amount of vacuolation which they exhibit—by which is meant the formation within the protoplasm of minute clear spherules, less refractive than that substance, and probably, therefore, spaces in it containing a watery fluid. The nuclei, of which there is generally not more than one in each cell, are frequently obscured by the vacuoles; but when visible are seen to be round or oval in shape, and beautifully clear and homogeneous; they commonly contain either one or two nucleoli. It is from these cells that the blood-vessels of the tissue are formed, and within them red, and perhaps also white, blood-corpuscles become developed. Of the vacuolated cells above described, some possess a distinct reddish tinge, either pretty evenly diffused over the whole corpuscle or in one or more patches, the edges of which are shaded off. Others contain either one, two, or a greater number of reddish globules, consisting apparently of haemoglobin. These vary in size from minute specks to spherules as large as, or even larger than the red corpuscles of the adult:

in cells which are apparently least developed, it is common to find them of various sizes in the same cell; whereas cells which are further advanced in development are not uncommonly crowded with haemoglobin globules tolerably equal in point of size, and differing from the adult corpuscle only in shape. It is important to remark that there is at no time an indication of any structure within the globules resembling a nucleus: the nucleus of the cell also appears up to this point at least to undergo no change. In fact, the formation of the haemoglobin globules reminds one rather of a deposit within the cell substance, such as occurs in developing fat cells, the difference being that in the latter case the deposited globules eventually run together into one drop, whereas in the former they remain distinct as they increase in size, and eventually take on the flattened form. Before, however, this change occurs in the haemoglobin globules, the cells containing them elongate, and are soon found each to contain a cavity, within which the globules now lie. This cavity is probably formed by a coalescence of the vacuoles of the cell. The cell now comes to resemble a segment of a capillary, but with pointed and closed extremities: it is of an elongated fusiform shape, and consists of a hyaline protoplasmic wall (in which the nucleus is imbedded) enclosing blood-corpuscles in a fluid—in fact, blood.

The Suctorial Organs of the Blow-fly.—In the last part of the *Monthly Microscopical Journal* (June, 1874), Dr. Anthony gives a minute and interesting account of the anatomy of the proboscis of the blow-fly. As usually mounted the organ is strongly compressed, and the relations of its several parts seriously interfered with; but Dr. Anthony has examined them *in situ*, and observes that whilst they have a certain resemblance to the proboscis of an elephant, the insect proboscis has the advantage over that of the mammal in that it can take in fluid not at the distal ends only, but, at the will of the creature, along the whole length of the tube. Along the whole length of the organ is a zig-zag slit or furrow, which is kept open by a series of incomplete chitinous rings, each having at the ends a quasi point and a crescent, which are opposite to each other, and form the framework of the fissure; and the points clothed with investing membrane, projecting opposite to the hollow of the crescent, give the zig-zag effect, which can easily be seen by reflected light. To the extremities of the chitinous rings, Dr. Anthony finds that certain membranes are attached which have a resemblance to a mouse's or bat's ear, and probably act as suckers. The chitinous rings are imbedded in a fleshy material, which he believes to be chiefly muscular, and when brought into action bend the chitinous arches till their extremities are in apposition; the longitudinal furrow is thus closed, and only a series of openings left from the suckers into the pseudo-tracheae, through the crescentic portion. Assuming the elasticity of these chitinous rings as playing a part, then the operation of sucking with the tongue applied to any surface might be thus described. The fleshy lobes of the tongue being forced into close contact with the said surface, the same muscular pressure round the chitinous rings would diminish the calibre of the pseudo-tracheae, make it into a tube by closing the longitudinal fissure, and bring the bell-like mouths of what may be regarded as principally the organs of adhesion, into the position and semblance of so many cupping glasses. So arranged, Dr. Anthony thinks that the relaxation of muscular effort would, by allowing of the resiliency of the chitinous rings, cause a vacuum in the tube, and set up a pumping process; and by alternate muscular action, fluid in the pseudo-tracheae would be forced into the oesophagus, while the same pressure would make the adhesion more perfect.

Hypnotism in the Crustacea.—In a paper published in the *Sitzungsberichte der Wiener Akademie* (Band lxvi., Heft 3, 4 and 5), Professor Johann Czermak relates some curious hypnotic effects he

has observed in certain Crustacea. His attention was drawn to the circumstance by a paper in which it was stated that if the ordinary crayfish was held firmly in the hand, and some magnetic passes made down its back, care being taken not to touch it, the animal soon became quiescent, and would permit itself to be placed on its head, where, if balanced by its nasal spine and chelae, it would remain for a considerable period. On being unmagnetised, so ran the report, by reverse passes, the animal again resumed its activity. Professor Czermak was induced to study these phenomena a little more closely, and soon found that the magnetic passes had nothing to do with the phenomenon; but the fact remained, that if the animal was firmly held, in spite of some struggling, with its head downwards for some time, it gradually became quiescent, and would long continue balanced in the mode above described, as though it were asleep. The mere retention of the animal upon its back, the first struggling movements being prevented, was followed in the same way by a period of quiescence of considerable duration, from which the creature awoke either spontaneously, or on the application of a strong stimulus. Further experiments showed that all active movements and response to ordinary stimuli, could be prevented in the crayfish by keeping it forcibly quiet for a time, either by binding it, or by fastening it between wooden pincers for a time. Czermak made some experiments corroborating the well-known action of a chalk line drawn from the beak forwards, or from both eyes outwards, on fowls, and which he says struck him with the utmost astonishment when he first observed its effects, the fowl remaining breathing violently, but perfectly quiet and incapable of reacting to ordinary stimuli. He found, however, that the chalk line was unnecessary, all that was required being to restrain the animal's efforts at escape on being first caught, and then quietly to stretch the neck and put the head in contact with the ground. By this means not only fowls, but geese, ducks, turkey-cocks, and swans, could be rendered quiescent, and apparently made to lose all voluntary control over their movements.

Spontaneous Generation.—At the last meeting of the Société de Biologie de Paris (*Rev. Scient.*, June 6, 1874), M. Onimus presented an apparatus by means of which he had been able to follow the formation of bacteria without the intervention of germs such as are contained, according to M. Pasteur, in the atmosphere. The apparatus in question consists of a flask with three tubules, in which a vacuum is made by filling it with water, and expelling the whole again by prolonged ebullition. One of the tubules ends in a hollow needle that is buried in the heart of a rabbit, or in the interior of an egg. The flask then sucks up some grammes of blood or of albumen. Air is then allowed to enter after filtration through a thick layer of cotton wool. M. Onimus then finds, after the lapse of a few days, that the liquid in the flask contains molecular granulations, and very soon afterwards vibrios and bacteria.

GENERAL MORIN recently exhibited to the French Academy a wonderful ingot of platinum-iridium, composed of 90 per cent. of platinum and 10 per cent. of iridium, and made for the construction of the standard mètres to be distributed among the States represented on the International Commission, in conformity with whose instructions the alloy was formed. The ingot weighed 250 kilogrammes, equal to 4 cwt. 3 qrs. 19·155 lb.; its length was 1 metre and 40 centimètres, or rather more than 3 feet 19 inches. The large quantity of platinum necessary for the work was furnished by Mr. Matthey, of London, and the Russian Government assisted in supplying the iridium. Two great difficulties had to be surmounted: one, the equable diffusion of the iridium throughout the bar, as the "remedy" was not to exceed 2 per cent.; and the other, the arrangement of a furnace to supply the required heat. The work was accom-

plished by M. Tresca, with the aid of MM. St. Claire Deville and Debray. The platinum was formed into thin plates, coiled up to hold the iridium, deposited in fine powder. These plates were forged into bars, and the bars melted into ingots weighing from 83 to 90 kilogrammes. These ingots were placed in a crucible of limestone (*calcaire grossier*) and reduced to fusion in seventy minutes by means of seven jets of oxygen combined with coal gas. Thirty-one cubic mètres of oxygen and twenty-four cubic mètres of coal gas were consumed in the process.

An analysis by M. Deville showed that the ingots first made contained: iron, 0·006; copper, 0·130; rhodium, 0·060; iridium, 10,370; platinum, 89·44: thus the iridium was a little in excess of the remedy, which was rectified in the final process by adding fresh platinum. First, the crucible was charged with 110 kilogrammes of the alloy in lumps, to which the remainder was added in thin plates when fusion had taken place. When the melting was complete, the cover of the crucible was removed, and the metal appeared of a dazzling silver white. The bar finally made by forging was found perfectly homogeneous, and intrinsically worth 250,000 francs.

The iridium was not obtained without danger, on account of its association in the native state with osmium, the most poisonous metal known. M. Debray had his eyes painfully attacked by the osmium fumes, M. Clément suffered from a cutaneous eruption that only yielded to a succession of sulphur baths, and M. Deville was tormented with violent asthma. He exhibited to the Academy a bottle containing eight kilogrammes of osmium, "enough," he exclaimed, "to poison the universe, as one milligramme of osmium diffused through 100 cubic metres of air renders it irrespirable." The milligramme is 0·154 of an English grain, and the 100 cubic metres nearly 131 cubic yards.

DR. W. G. FARLOW, of Cambridge, Mass., U.S.A., has recently published, in the Proceedings of the American Academy of Science and Art, an account of some researches made in the botanical laboratory of the University of Strassburg, proving the existence of a remarkable asexual development from the prothallus of *Pteris serrulata*. In the centre of the cushion or thickest part of the prothallus are a number of scalariform ducts, the prothallus bearing a number of antheridia, but no archegonia. From these ducts a leaf is developed directly, after which a root is also developed, and last of all a stem-bud. Dr. Farlow draws a comparison between this growth, which was observed in this species only, and the buds ordinarily produced from the protonema of a moss. Normally the prothallus of a fern is entirely destitute of vascular tissue of any kind.

ONE of the most important educational botanical works recently published is Professor Oliver's *Illustrations of the Principal Natural Orders of the Vegetable Kingdom*, issued under the sanction of the Science and Art Department. The letter-press consists of a very brief epitome of the essential points in the structure of each of the more important natural orders, and a few lines as to its geographical distribution and economical or medicinal value. The plates, upwards of 100 in number, contain each a drawing of a section of the flower of a species belonging to the order, a diagram of the flower, and illustrations of the fruit, seed, &c. The book is invaluable both to the student and to the science-teacher; and supplies a long-acknowledged desideratum in presenting the salient characters of the various natural orders in a very small space, and in a form the most calculated to arrest the attention and to impress itself on the memory.

LAST week we referred to the opinion expressed by certain geological authorities, that the thick mass of clay now being pierced by the Sub-Wealden boring may represent, in its lower part, the Oxford clay. This opinion has been satis-

factorily confirmed by the work of the past week. At the meeting of the Geological Society last Wednesday evening, Mr. W. Topley exhibited a number of cores recently extracted, containing fossils which are considered characteristic of the Oxford clay. The collection included the well-known *Ammonites Jason*. It is encouraging to learn from these fossils that the boring is now much lower in the geological series than might otherwise have been expected.

THE Academy of Sciences has just elected, as foreign correspondent, M. A. de Candolle, of Geneva, the distinguished botanist.

THE Government of the Netherlands, following in the wake of other nations, is fitting out an expedition for the observation of the transit of Venus. It is intended to make the Ile de Réunion the scene of the observations, which will be under the direction of Herr van Sande Backhuysen, Director of the Observatory at Leyden.

THE last mail from India has brought some valuable additions to the *Bibliotheca Indica*. We have received the last number of the second volume of the *Tāndya-Brāhmaṇa*. This completes this important work, and gives at the end a table of contents. Then there is the first fasciculus of the second part of the *Sāmaveda-samhitā*, a most valuable work. The *Taittiriya-samhitā* also advances by one number, and has now reached the 11th Anuvāka of the 3rd Prapāthaka of the 4th book. It is to be hoped that the publication of this work may proceed as quickly as possible. The most valuable addition, however, is the *Kātantra Grammar*, edited by Professor Eggeling. This is evidently a work of great labour, and reflects the highest credit on the critical acumen of the editor.

BISHOP COLENSO has completed his "Examination" of that part of the *New Bible Commentary*, which refers to the Pentateuch and the Book of Joshua. (London: Longmans & Co.) In Part VI., which has just appeared, he gives a detailed answer to the "fallacious, evasive, inaccurate, uncritical, &c. &c. reasoning" of which Mr. Espin has, he thinks, given numerous instances in his work on Joshua. The Hebraist will be especially surprised at the inaccuracy of the Biblical references by which Mr. Espin seeks to prove that the Book of Joshua is a separate and complete work, produced by a single author. With regard to Mr. Espin's misrepresentation of Ewald's view of the famous inscription in Procopius—"We are those that fled from before the robber Jesus the son of Naue"—it may be added that the whole story probably arose out of the mistranslation of Isa. xvii. 9 in the Septuagint: *ὁ πρόπον ἐγκατέλιπον οἱ Ἀρραβῆται καὶ οἱ Ἑβῆται ἀπὸ προσώπου τῶν υἱῶν Ἰσραὴλ*.

THE *Numismatic Chronicle*, vol. xiv. (1874), pt. i. is entirely occupied by one article "On the Chronological Sequence of the Coins of Syracuse," by Barclay V. Head. As this article is also published in a separate form, under the title of "History of the Coinage of Syracuse," we hope before long to accord to it the notice it deserves. In the meanwhile it is sufficient to observe that the fifteen autotype plates by which the treatise is illustrated exhibit by nearly two hundred representative coins the whole series of the Syracusan coinage—the most complete, and, as a whole, the most beautiful series of coins struck by any state, from the time of the Geomori in the sixth century B.C. to the Roman conquest. For artistic merit, for accuracy, and completeness, these plates leave nothing to be desired.

MEETINGS OF SOCIETIES.

ZOOLOGICAL SOCIETY (June 16).

DR. A. GÜNTHER, Vice-President, in the Chair. An extract was read from a letter received from Dr. A. B. Meyer, concerning two birds (*Rallies Bennetti* and *Campephaga aurulenta*) lately de-

scribed in the Society's Proceedings by Mr. Sclater. —A letter was read from Mr. William Summerhayes relating to certain species of Curassows found in Venezuela. Dr. J. Murie read a paper "On the Nature of the Sacs vomited by the Hornbills," which he stated, in confirmation of Professor Flower's account of these objects, to consist of the epithelial lining of the stomach. Mr. W. Saville Kent, F.L.S., communicated a second paper upon the gigantic cephalopods recently encountered off Newfoundland. From further information received, Mr. Saville Kent apprehended that it would be necessary to refer the two individuals preserved in St. John's Museum to the genus *Ommatostrephes*, thus avoiding the institution of a new genus for their reception, as proposed in his former paper. Mr. A. H. Garrod read a paper on the "showing off" of the Australian Bustard (*Eupodotis australis*), and pointed out the peculiar structures by which this "showing off" was accomplished. A communication was read from Dr. F. Stoliczka, containing a description of the *Oris Polii* of Blyth, of which he had lately obtained specimens in Yarkand. Mr. R. B. Sharpe read a paper on a new genus and species of Passerine birds from the West Indies, which he proposed to name *Phoenicomanes iora*. A communication was read from the Rev. O. P. Cambridge, containing descriptions of some new species of spiders of the genus *Erigone* from North America. Dr. Günther read a paper describing some new species of reptiles from the Camaroon Mountains, West Africa. Amongst these were two new species of Chameleon, and a new snake of the family of Lycodontidae, proposed to be called *Lophocryptus ater*. One of these chameleons was referred to a new sub-genus (*Rhampholeon*), being remarkable for its abbreviated tail and the development of a denticle at the inner base of each claw. Mr. Sclater read a paper containing a description of three new species of the genus *Synallaxis* from M. Jelski's collections in Central Peru, which he proposed to call *S. pudibunda*, *S. graminicola*, and *S. virgata*. Messrs. H. P. Blackmore and E. R. Alston communicated a joint paper on the Arvicolidæ which have hitherto been found in a fossil state. Professor Newton read an account of a living Dodo shipped for England in the year 1628, extracted from letters in the possession of Dr. J. B. Wilmot, of Tunbridge Wells. Mr. J. E. Harting read a paper on the common Lapwing of Chili, which he proposed to separate from *Vanellus caymansis*, under the name *V. occidentalis*. A second paper read by Mr. Harting contained an account of the eggs of some new or little-known Limicolæ. A communication was read from Mr. R. Swinhoe containing an account of a new Cervine form discovered in the mountains near Ningpo, China, by Mr. A. Michie, and proposed to be called *Lophotragus michianus*. Dr. J. Murie read a paper on the structure of the skeleton of *Fregilupus varius*, based on a specimen in the Museum of Cambridge.

PHYSICAL SOCIETY (Saturday, June 20).

MR. W. CROOKES, F.R.S., exhibited experiments on "Attraction and Repulsion accompanying Radiation," some of which were communicated to the Royal Society in December, 1873, and have since attracted much attention. Various attempts have been made to account for the phenomena discovered by Mr. Crookes, by attributing them to air-currents, or to the action of electricity; but the only explanation hitherto offered which seems even plausible is that suggested by Professor Osborne Reynolds, in a paper communicated to the Royal Society on Thursday, 21st inst. Professor Reynolds supposes that the effects in question may be due to alterations caused by heat or cold in the equilibrium of a minute film of condensed vapour. There can be little doubt that the cause assigned, if actually existing, might produce

the observed results; but Mr. Crookes gave reasons for regarding it as inadmissible.—Mr. C. J. Woodward exhibited experiments for the purpose of illustrating to an audience the nature of wave-motion. The method consisted in throwing upon a screen an image of a screw or of a spirally coiled wire, which is made to revolve upon its axis. Mr. Woodward also exhibited a modification of Quincke's well-known experiments on the interference of sound, in which a reed is substituted for the tuning-fork employed by Quincke as the source of sound. A simplified construction of Quincke's apparatus was described by Professor W. F. Barrett.

ASIATIC SOCIETY (Monday, June 22).

JAMES FERGUSON, Esq., Vice-President, in the Chair. Dr. S. W. Bushell read a paper on the old Mongolian capital of Shangtu. The extensive ruins of this city were visited by the writer, together with the Hon. T. G. Grosvenor, on September 16, 1872. They are situated some twenty-seven miles N.W. of Dolonnor. Abbé Huc wrongly supposed the latter place to have been built on the site of the ancient city. Shangtu was founded in A.D. 1256, during the reign of the emperor Hien Tsung, and became the imperial residence for a time every year. In 1268 it was made the seat of a Governor-general. After the fall of the Yuan dynasty the city rapidly diminished in importance. It was taken in the second year of the new reign (A.D. 1369), but remained constantly attacked and harassed by the nomadic Mongolian tribes, until it was finally abandoned by the Chinese in A.D. 1430, when the frontier was contracted to the line of the Great Wall, and the garrison removed to Tu-shih-kou.

The site was visited by the Jesuit missionary, Gerbillon, towards the end of the seventeenth century. The ruins are now known by the Mongol name of Chao naiman sumé Hotun, "the city of a hundred and eight temples." The city had a double wall, the outer forming a square of about eight li with six gates, the inner being about eight li in circuit with only three gates, one of which, a perfect arch twenty feet high by twelve feet wide, is still intact. The ground in the interior of both enclosures is strewn with blocks of marble and other remains of large temples and palaces, the outlines of the foundation of some of which can yet be traced; while broken lions, dragons, and the remains of other carved monuments lie about in every direction, half-hidden by the thick and tangled overgrowth. An inscription of the Yuan dynasty, in an ancient form of the Chinese character, on a memorial tablet lying amid many other relics on a raised piece of ground, evidently the site of a large temple, has been copied and translated by Dr. Bushell. It is surrounded by a border of dragons boldly carved in deep relief.

A paper on the "Origines of the Manchus," by Mr. Henry H. Howorth, was also read. The paper started from the etymologies of the word "Manchu" proposed by various writers, the derivation of the word from "Manchusi," the name of a Corean deity, appearing to the writer to be the most obvious. He then proceeded to examine at length the legendary accounts of the Manchus regarding their own origin, and their history from the earliest times down to A.D. 1025, the year of the death of Tai-tsu.

GEOLOGICAL SOCIETY (Wednesday, June 24).

MR. J. EVANS, F.R.S., President, in the Chair. No fewer than twenty-six papers were announced for reading at this, the last meeting of the session. The greater number of these were of course summarily disposed of, by being either read in short abstract, or merely taken as read. Two papers only were read in full, and duly discussed. Professor J. Young and Mr. J. Young, of Glasgow, communicated a paper "On *Palaeocoryne* and other Polyzoal Appendages." A few

years ago Dr. Duncan and Mr. Jenkins established the genus *Palaeocoryne*, and referred it to the class *Hydrozoa*. The authors of the present communication, after studying a large number of specimens, deny that this structure represents a distinct organism, and regard it only as the stellar appendages given off from the frond of a palaeozoic polyzoan. In a paper on "The Steppes of Siberia," Mr. T. Belt described a journey which he made last autumn through South-western Siberia. Crossing the Urals, he proceeded from Ekaterinburg to Omsk, and thence up the Irtysh to Pavlodar, and finally reached Karakolinsk. During this journey he studied the geological characters of the deposits forming the Steppes, as seen in river-sections. In some of these deposits he found *Corbicula* (*Cyrena*) *humilis*. Mr. Belt, in seeking to explain the origin of the Steppes, remarked that they bear no relation to the present river-system of the country. Von Cotta had suggested that they owe their origin to marine action; but the absence of marine shells, not to mention other evidence, does not support this theory. According to Mr. Belt, a satisfactory explanation may be found by supposing that an overflow of polar ice, during the glacial period, formed a barrier blocking up the drainage of Siberia, and thus giving rise to the formation of a vast lake, in which were deposited the great beds of sand and loam which now form the Steppes. Among the specimens exhibited at this meeting were some fine examples of tin ore from the recently-discovered deposits at Mount Bischoff, in Tasmania.

FINE ART.

Roman Imperial Photographs. Arranged by John Edward Lee, F.S.A., F.G.S. (London: Longmans & Co., 1874.)

UNDER this title Mr. Lee has published a series of forty portraits of Roman Imperial persons, produced by enlarging, with the aid of photography, the portraits engraved on their coins. We are most ready to welcome all attempts to render familiar the handiwork of the ancients, and to give life and reality to Roman history. Nor does the fact that these representations are mechanical reproductions in any way destroy their value. The works of nature need the eye and hand of an artist to interpret them. But the more mechanical copies of works of art are the better, for one artist can never perfectly copy another, especially after the lapse of ages. Hence we believe that to photography and other copying arts there is reserved the task of disseminating faithful copies of artistic works of all kinds, from those of Phidias and Raphael downwards. But, unfortunately, we cannot regard Mr. Lee's work as successful. In the first place, it is very misleading indeed to present a single coin of a Roman Emperor as giving his portrait. Coins give, it is true, most characteristic representations, but such as sacrifice fidelity to effect. The object of the die-sinker was not to produce an excellent portrait, but to bring out all the features of the person represented in strong relief, so that they could not be mistaken, even when the coins that bore them were worn down. The sunken eye of Antiochus, the easy fleshiness of Philetaerus, the grim features of Caesar, are brought out on coins with a distinctness which sometimes makes one smile, as at a caricature. Everything is exaggerated, and therefore distorted. But the plan followed by Mr. Lee, of magnifying

several times the faces on the coins, makes this feature even more obvious. Distortions which one would not condemn in a representation of half an inch square, become intolerable in one of four inches square. And further still, Mr. Lee would have done much better if, instead of taking his photographs from original coins, often somewhat defaced, he had taken them from plaster casts of the best coins in existence, which might easily have been obtained. The coin of Carinus, for example, which is here figured, is much defaced, that of Faustina the younger is miserably poor, and that of Trajan extremely ugly.

It appears, however, from the preface to this work, that the editor has only published it by the way, as these photographs formed part of his material for another work, a series of 150 profiles of Roman worthies, drawn by an artist from coins, aided by photographs. This is a work of a more promising character, and we shall hope to be able to say more in its favour. In the meantime we wish that those who have access to the best representations produced by ancient artists had some of the zeal of Mr. Lee for the diffusion of copies of those representations. PERCY GARDNER.

THE EXHIBITION OF WORKS OF ART IN BLACK AND WHITE.

IN commenting upon the second Exhibition of Works of Art in Black and White, which has opened its doors this week to the public, at the Dudley Gallery of the Egyptian Hall, it will be useless to follow the minute subdivisions which, in their circular addressed to artists, the committee marked out. Such elaborate classification would only be wearying in a brief review of what there is to see; and it will be well to divide roughly: to speak first of drawings and then of prints, though the prints, when we come to them, may naturally be ranged under two heads: those which are original work, and those which are copies.

Several of the best of living English artists contribute drawings to this exhibition. Mr. Watts and Mr. Leighton are amongst the number. One French artist of the highest class, M. Millet, now known to all the world by his great works in painting, sends two charcoal drawings, one of which possesses in a quite singular degree the charm of his work in oil; and another Frenchman, M. Lhermitte, sends charcoal pictures which can hardly fail to add in England to a reputation already beginning. There are contributions from many artists of the second rank, and much amateur work which it has been a mistake to accept, and too much also of such work of professional artists as is of a quality that can neither increase their fame nor give us any rational interest. In fact, the exhibition, though it has been long prepared for and waited for—an interval of two years having occurred since the last—is felt to be somewhat of a "scratch" exhibition. The range of material for composing it, is not, it must be remembered, in reality so wide as it seems; or, rather, it is not likely to include very much of that which is of the highest accomplishment. Yet the exhibition has a distinct place, among the rest, though just now it is a modest one. It has a value in bringing before our notice the productions of artists with whom other exhibitions fail to make us familiar; and it has a value too in enabling us the better to gauge the real power and importance of many men with whose more elaborate work we are already pretty well acquainted. Stripped of the common aids, stripped of the charm of colour, such work as is

shown here is put, of necessity, to a severe test. The great men have always been well nigh greatest, and the feeble men most feeble, when embodying their ideas, or recording their impressions, only in black and white.

And from this test no one will come out better than Mr. Leighton among the English, and M. Millet among the French. It is true that Mr. Leighton exhibits two heads—one of a Capri woman, which has been reproduced in the *Portfolio*; the other, called *Rubiniella, Capri*—which are at first sight disappointing. But the fault in the first is probably in the subject; a want of beauty hardly compensated for in this case either by presence of individuality of character or by quiet and plaintive bodily grace. And the fault in the second—the stiffness, hardness, weakness, of the neck—is felt, while you look at the modelling and character of the head, to be such an accident as might happen once to any master. Strong in drawing, strong in grace, the pencil in Mr. Leighton's hand can be no inadequate substitute for the brush. No. 420, a carved and font-like well in the court of a Venetian palace, would show fairly enough, if there were no other to show it better, the artist's feeling for lines of combined richness and delicacy; but No. 171, a drawing of a lemon tree in Capri, shows the same thing better than the other drawing, and better than any painted work. It is a most patient and quite finished study, of inconceivable grace and charm; done, we may be sure, with a keen and accurate sense of the beauty of every delicate line and curve of stem and leaf and fruit.

Mr. G. F. Watts's principal design is that numbered 241, and called *The Sleeper Awakened*. "The people that walked in darkness have seen a great light," is written under the drawing; and though its size is small, its style, while finished, is large and grand, and its effect solemn. A lighter grace is aimed at and attained by Mr. Watts in No. 271; while another contribution, No. 433 (called only *Studies in Pencil*), reminds us what a fine accuracy commonly underlies all that is large and broad in the work he is more accustomed to exhibit.

Among many drawings contributed by M. Léon Lhermitte, we may single out four. Two of them are companions, No. 120 and No. 162, called respectively *The Last Ceremony*—that is, a service for the dead—and the *Pilgrimage*; that is, a group of worshippers kneeling at a famous shrine. The first is remarkable for warmth, and colour, and harmony; the second is good in composition, and a well-lighted piece. *Héloïse* is noteworthy for the strong modelling of the head, and for its light and shade; and lastly, *Sheep-washing*, No. 296, is a transcript from the life, and is warm with the glow and the shadow of evening.

In entire contrast, by its method, to this broad work of M. Lhermitte's, is a study by one whose work would have been almost the last we should have turned to in expectation of such contrast, for the delightful head called *Study: Rome, 1873*, and numbered, with two less significant works, No. 270, is by M. Legros. It is a fine lead-pencil drawing, bestowing, one might say, as one looks round, upon the medium almost a new dignity; for nothing in the exhibition is nobler than this little head, and nothing is really larger, though it is small; and nothing is more delicate, though it is strong and firm. What a fine intellectual beauty, reflected on the physical beauty of the face! the type, how elevated! how mobile, yet serene! The moulding of the mouth that in one more instant will speak; the delicate shadow on the chin; the almost movement; the gesture—all the live face is there; yet you can count the strokes of the work, and see how, little touch by touch, the scientific but sympathetic artist has built up this effect.

Among the other drawings which claim some consideration and will certainly receive it at the hands of the visitor, are contributions from the portfolios of the late George Cattermole, of the

younger Leslie, of Henry Moore, of Edward Armitage. Mr. Hubert Herkomer sends several designs which, along now and then with some triviality of subject, show good drawing: drawing not always absolutely scientific, but in which one feels that under the garments there is the figure and the movement; and also the artist shows ease of invention and a range that gives promise of more important things. And since we are now among the least ambitious of the subjects, let us notice the grotesque drawings of Miss Kate Greenaway and Mr. F. A. Hopkins. The *Petit Diner à la Cigarette* by the last-named contributor has not only the humour that justifies its existence, but though lacking variety of models—though the little naked fellow is repeated to monotony—it has a certain roundness and ease of design which may one day be employed to more serious purpose, or indeed not with more serious purpose, but with greater success to a purpose avowedly light. Of pen-and-ink drawings, made for *Punch*, Mr. Du Maurier sends a goodly array. The best of them—much the best of them, and it is of singular grace—is that called *Praxy*—one little girl, not religiously inclined, is beseeching her sister to say a double portion of prayers. The little bedgown figures have such a healthy sweetness of line that one is tempted to forget how intractable for high artistic purpose pen and ink generally prove.

Mr. Edwin Edwards, whose pure etching (to mention it out of its proper place) has some of the faults and qualities of Mr. Whistler's—accurate study and frankness, with an unfortunate hardness and want of tone—sends pen-and-ink sketches which display the same characteristics. The *Ouse near Bedford* is the worst of them: *Yarmouth* and *Lowestoft* are the best: these best display an admirable sense of proportion, though here too the hardness almost inseparable from the material becomes evident. Miss Thompson's finely executed drawings—three in number—will, of course, attract attention. *Choosing Models in Rome* is very true and somewhat humorous. "*Halt!*" a *Reminiscence of Aldershot* has concentration and composition which are lacking to the third; and yet the third, which is called "*Gallop!*" a *Reminiscence of Woolwich*, contains what is her best work in this exhibition: nay, it contains, I think, the best work she has yet done, and saves her quite unmistakably from the dangerous honour of painting only one famous picture. This *Gallop* is remarkable on several grounds, for though I say it has not got the composition of the second subject—suffers, in a word, as a whole, from being a little scattered and straggling—yet the group of horses' heads, all close together, all so variously turned and held and lifted, and all so strong, is really an excellent achievement; and besides this, the vigour of the drawing of certain horses in action—the strain upon these fiery beasts, that are furiously dragging the light artillery to the field—is not, I think, very easily to be matched in modern work.

Rapidly jotting down one or two comments by the way, one should notice the character in Mr. Hennessy's contribution and in Mr. Macnab's *Cigarette*: a lazy fellow, not too lazy, however, to be critical in his enjoyment. One should notice the truth of reflected light in shadow in Miss Ellen Hill's large chalk drawing of Mr. Edwin Hill, and the grave landscape subjects of Mr. Joseph Knight. One should notice, as not quite worthy of him, T. G. Vibert's drawing of *An Actor learning his Part*; and one should pause before the complete and large accomplishment of François Millet's *Potato Harvest*: a group of two peasants, with a long barrow, and a potato sack held between them, in the wide and open field. Among a crowd of less significant things, here at last is a great and manly one.

One would gladly spare oneself the task of wholly unfavourable comment; and there is so much work that is by no means strong that the task of enumerating it would be a long and a useless one. Mr. Holt's drawing of *The Foundling*

may be good in sentiment, but it is weak in execution; and an allegorical subject by Mr. Walter Crane is among the most conspicuous, and (dare I not add?) among the most strangely unaccountable of the failures. The heaviness of the drapery is pitiable: an artist who can do much better, ought not to send this work.

Turning now to Etching, it may be said that the greatest English etchers are almost wholly missing. There is nothing here of Mr. Seymour Haden's, and that is an absence which we can ill endure. One etching like the *Agamemnon*, or one like the *Shere Mill Pond*, would be worth any dozen chosen at a hazard among those that are here. Mr. Whistler, too, does not exhibit a stroke; he reserves everything for Pall Mall. And among the English etchers who promise us the most, Mr. Chattock is absent—he is exhibiting at the Academy—and Mr. Heseltine has found nothing to send. Nor is this absence of contributions from the best English etchers even attempted to be compensated for by any unusual show of the work of the French. Nothing could have been more appropriate (since one observes upon the walls the work of some men not now living) than to have displayed the whole series of the master modern etcher of architecture, Charles Méryon; and it is difficult to believe that impressions of his work, had they been sought for, would not have been forthcoming. But we must be content without them; and in looking round upon the English work, it is pleasant to notice that, though much of it is insufficient as to result, it is most of it worthy in aim, and it is most of it done by the methods of the genuine etcher, with no confusion between the proper work of etching and the proper work of steel engraving. Here and there, of course, is an exception; but on the whole it may be said that, thanks partly to the plainly-worded counsel of Mr. Hamerton, and thanks partly to the study of the great old etchers, of whom Rembrandt, of course, is chief, and thanks partly too to study of Mr. Haden's work (which by subject and sentiment has more in common with the efforts natural to etchers now living and learning), the old fault and weakness of the *prostitution* of Etching has now well nigh ceased. The independence of the art is recognised and remembered; and though the work is sometimes hard, sometimes wanting tone, it is on the whole manly and promising. Dr. Propert's *Chiswick*, No. 108, is a favourable example of recent work. There is perhaps some lack of feeling for air and space in Mr. Slocombe's *Margate Cliffs and Jetty*, No. 167. Another Mr. Slocombe's *Quiet Retreat at Pinner*, while being as good in drawing, has certainly more artistic charm. Of the best French work that is original, some account happens to have already been given in this journal, but one recognises again with pleasure the work of M. Lalanne and of M. Feyen Perrin.

Coming to work that interprets not Nature, or the artist's original conception, but the work of other men, one finds that one is wholly among the Frenchmen; though almost the greatest of these French interpreters is absent. That is Flameng, who has won fame by copying the prints of Rembrandt. But Flameng is, after all, and with all his greatness, entirely a copyist: he copies line for line. Jacquemart is more properly an interpreter. He does almost what a fine actor does for a good author. He identifies himself with the spirit of the work: reproducing the spirit with greater truth than the letter. Thus in the magnificent impression on the door screen at the Dudley Gallery, of his etching after the *Mrs. Seaforth and Child*, or *Widow and Child* in Mr. Wilson's famous collection—picture now exhibiting by-the-by at the Alsace-Lorraine Exhibition in Paris—Jacquemart has contrived to indicate, nay, I think actually to realise, all the quality of Sir Joshua—Sir Joshua as known to Jacquemart by many a work, and not alone by this one. The etching is a quite charming and perfect thing; the original, it may be remembered, is rather

heavy and thick in its painting—it is one of the works in which the great painter went furthest (and he was generally far) from the lighter handling of Gainsborough.

FREDERICK WEDMORE.

RE-OPENING OF THE EXHIBITION AT THE CORPS LÉGISLATIF.

Paris: June 22, 1874.

TO-DAY is re-opened, after remaining closed a week for almost entire reorganisation, the Exhibition which was formed two months ago in the rooms of the Corps Législatif for the benefit of the emigrants from Alsace and Lorraine who have left their native provinces to settle in Algeria.

Two motives have jointly contributed to the success of this Exhibition—curiosity to see rare and beautiful works of art, and patriotic charity. The idea was first started in M. d'Haussonville's drawing-room; it was most favourably received in high Orleanist society, and the Duc d'Aumale consented to lend part of his gallery, which a few years ago was the ornament of his mansion at Twickenham. It has been quite the fashion to meet in these rooms, especially on Monday, which is a five-franc day, the charge for admission on the other plebeian days being one franc. Journals of all shades have gratuitously placed their advertising columns at the disposal of the organising committee, and the first campaign has already produced above 200,000 francs, while more than half that sum is expected from the second, which will last till September 1. The exhibition therefore will have brought in the net sum of over 300,000 francs, besides furnishing the public and the critics with an opportunity of recreation and of interesting study.

I shall confine myself to-day to a few general hints or reflections. I have not been able as yet to verify with certainty what has been removed, and what is entirely novel, and do not wish to expose myself to the risk of mentioning objects which might no longer be found by any reader who should be induced by my letter to pay a visit to Paris. I shall, however, call attention with great regret to two works of the first rank, which have had a great success. One was the head of Michel-Angelo in bronze, modelled by one of his pupils in beautiful style and with a deep feeling of melancholy; of this, I believe, there exist replicas. The other is a leg in bronze, found in the course of some excavations in Magna Græcia, which belonged to a life-size statue; the foot and leg are bare, while the rest is covered with a kind of stocking, which must have been of leather, as it shows the lines of the muscles with great precision; it is ornamented on the knee with an admirably characterised Medusa's head, and the tint is greyish yellow, as delicate in tone as it is uncommon. The two bronzes belong to M. Eugène Piot, an amateur of most cultivated taste, who has edited and almost entirely written, except during an interval, a periodical entitled *le Cabinet de l'Antiquaire et de l'Amateur*. He has also at various times sold off objects which he was tired of, or which he thought unworthy of a place in his cabinets. The South Kensington Museum has several Italian bronzes of the Renaissance period derived from this source.

The catalogue of the first exhibition comprised 708 paintings, ancient and modern, of the French and foreign schools. Ancient and modern works of art, statues, drawings, bronzes, arms, porcelain, tapestry, furniture, curiosities, watches, &c., filled almost the whole of ten rooms. The Rothschild family had one to itself, in which there was a collection of Boule furniture, and, in the centre, a fine bronze statue, a nude Prometheus, with the arms raised, brandishing flames as he goes; in the cases, Limoges enamels, portraits, or dinner-services; rock-crystals cut and engraved; specimens of maiolica and plates with figures of reptiles by Bernard Palissy; ten of those precious objects in inlaid earthenware, long called "*pièces de service*"

de Henri II." and now known to have been manufactured at Oléron, in Vendée, under the superintendence of a widow lady of high culture and position, Hélène d'Angest; specimens of Venetian glass; a great number of French or Italian jewels, representing monsters or mythological heroes, the bodies formed of the grotesque projections of the so-called "baroque" pearls. This room also contained, beside some busts of the time of Louis XIV., two iron goads for driving elephants, Indian work of exquisite beauty, expressing the force and grace, the wealth and genius of a whole civilisation: mythical personages and fabulous lions appear in the midst of foliage; the reliefs, contrasting with the blackness of the depths of the open-worked iron, catch a thousand flashes of light; while the point and handle of the goads are clear and polished, and allow the spectator to enjoy the glittering and compact beauty of this metal, second in quality of tone to gold only.

The place of this room is now supplied by Sir Richard Wallace, not with curiosities or pictures as choice as those which he has lent you at Bethnal Green, but with pictures of the French school and French furniture which adorn the rooms of his country-seat at Bagatelle. The intention is good, and we must thank the owner for not forgetting that it was in France that he passed the best and most peaceful years of his life. The somewhat dark and narrow glazed gallery, built by Morny, in the garden of the Presidency of the Corps Législatif, and still preserved, contains a great number of modern Dutch and Flemish pictures. I will give a list of them, but I shall not devote much attention to them. It seems to me more interesting to study certain changes in the public estimate of contemporary masters, such as Paul Delaroche, Decamps, and Ingres.

This Exhibition is from all points of view very important. It would be still more so if the committee which organised it, and which superintends it so zealously, were not finally to dissolve, but to form itself into a permanent society. It would then have gained experience as to the faults it has committed, the difficulties it has had to surmount, the amateurs it has had to accept or reject. The arrangement of the pictures, though better than during the first Exhibition, yet leaves something to be desired. We still find too many tares mingled with the wheat. Mr. Rossetti's remarks, which I read in the last number of the ACADEMY, as to the ever-extending inundation of mediocre or worthless foreign works in your International Exhibition, are even more strikingly applicable here. Quality is everything for the enjoyment of amateurs, for the instruction of critics or the working classes. Quantity is like the course of feeding that we force upon certain geese, to produce a liver disease in the poor birds for our own profit. We are entering into the scientific period, at least as regards the revision of the things of the past. We have a right to choose the materials for this great historic suit, which will modify many points of view and displace many reputations. Since people of the world are anxious to bring us the help of their influence, their connexions, and even their energies, it would be well that they should accept a kind of programme, whose principal points should be drawn up in common. One French institution, of which I shall speak hereafter, the "Central Union of the Fine Arts applied to Industry," has already devoted its attention to subjects of the same kind. But as you do me the honour of letting me speak in an English paper, allow me to overstep my bounds, and to suggest to your readers a kind of international agreement, which should sanction the annual exchange of choice exhibitions of works of art. The scheme is worth your consideration. In a future letter I shall introduce you to the gallery, from which, very wisely, it has been determined not to exclude our great dealers. The Empire has, it is true, so singularly modified traditional notions in France, that it is now a matter of some difficulty to distinguish a

pure amateur, devoted to his passion, from a collector who buys only to sell again.

PH. BURY.

THE MUNICH GALLERY.

UNDER this name a suite of rooms at No. 48, Great Marlborough Street has been opened. The catalogue speaks of "Exhibition of Pictures by Kaulbach, and other celebrated artists of the Munich school:" in fact, however, there are not as yet on view any coloured works by Kaulbach, only cartoon or monochrome compositions, and the other celebrated artists would seem to have found a royal road to celebrity. It appears that some more works are to follow: among them Kaulbach's *Faust and Mephistopheles*, and *The Emperor Charles V. in a Monastery*, by Piloty. The interest of the exhibition centres in the productions of Kaulbach, whose justly honoured name has perhaps been put forward to give currency to other stock of a far from pre-eminent kind. The minor pictures are in a high degree both poor and unattractive.

Kaulbach undoubtedly had capacity of a high order; a large range of invention, in which imagination was one constituent, and strong sardonic pungency another; a striking power of enforcement; able combination, composition, and grouping; knowledge of design, and, generally, the qualities which distinguish an intellectual from a purely artistic, or a mere trained and professional painter. What he lacked was that "purely artistic" element—the love or instinct of executive beauty, the exquisite balance between mastery and suavity of hand. This, in the long run, is a deficiency never to be compensated. The inner hierarchy of art is composed of painters who possess that faculty; while the others—however wide-minded, however skilled and learned—have to remain in the outer courts of the temple.

In the present collection we find three works by Kaulbach. The finest in manner is by far the least large of the three—*Amor and Psyche*, executed in 1828, and imbued to some considerable extent with the style of Cornelius. The most important in matter and composition is *Peter Arbus, Inquisitor of Saragossa, condemns a Family of Heretics to be burnt*—a work which used to be well-known to the many visitors at the studio of this highly distinguished and (as we found him in 1870) most courteous and genial painter. The catalogue gives some account of the subject; but omits the one central and primary point—namely, that the ghostly old Inquisitor, the vampire over the population of a whole city, mind and body, is blind: he has to touch with his staff those for whom the flames are to be lit, and his hand is guided by sordid wretches more loathsome than himself. This horrid story is realised to the mind with great power, and to the eye with excellent force of arrangement and perspicuity of subsidiary detail. The other large cartoon is of the scenic class, and of course much less interesting—*King James V. of Scotland opening the Parliament of 1532 in Edinburgh*. The painter has evidently aimed at giving something of Scottish character to the faces, but not with more than moderate success.

The one remaining work in the gallery that has some prominent degree of merit is the *Last Moments of Joseph II., Emperor of Austria*, by Professor Conrader. This is a very large work, of a vigorous but still a commonplace order; it contains some forcibly painted heads. Very large again, but altogether of the dead-alive academical kind, is *The Triumph of Bacchus*, by Professor Otto. On such work as *The Battle of Granicus*, by Gunkel; *The Ratcatcher* (from Göthe's poem), by Teichlein; *King Lear rejecting Cordelia*, by Heckel; *The Finding of Moses*, by Zimmermann; or the *Landscape*, by Bamberger—all of them pretentious productions, big or biggish—we need not dwell. *The Flood*, by Schorn, which was to have been repeated in the Munich Pinacothek, has more in it as a composition, but evinces neither sense of nature nor sense of execution. Among the smaller

pictures, Winkler's *Scene from the Franco-German War*, 1870—a snow-subject hung somewhat out of sight—appears to be one of the best.

W. M. ROSSETTI.

ART SALES.

THE collection of M. J. F. Leturcq, of Paris, was disposed of by auction by Messrs. Sotheby, Wilkinson, and Hodge, on Wednesday week and the three following days. Among the principal lots in the modern part we may mention a sardonyx cameo of two strata, set in brilliants, representing a full-faced head of Jupiter Serapis, 50*l.* (Salviati); another, obverse, helmeted head of Minerva; reverse, head of a Negro King, 35*l.* (Salviati); another, laureated head of Augustus, inscribed with his name in relief, 32*l.* (Castellani); an emerald intaglio, Venus Anadyomene, drawn by two dolphins, 43*l.* (Phillips); Amazonian stone, full-faced head of a monster with ruby eyes, probably Mexican, 12 *gs.*; agate onyx, Sabina wife of Hadrian, 32 *gs.*; agate onyx, head of Omphale attired in the lion's skin, 10 *gs.*; sardonyx Imperial head crowned with laurel, 14*l.* 10*s.* (Castellani). Among the antique specimens we note a sardonyx intaglio representing Jupiter grasping the thunder, with an eagle at his feet, 50*l.* (Salviati); a cameo of the same stone, engraved with a curious allegory representing an annular eclipse of the sun, 51*l.* (Jackson); another, Polyhymnia seated, meditating, before her a little column surmounted by a figure of a child, 78*l.*; a cornelian intaglio, Terpsichore tuning her lyre, with a figure of a deity on a pillar, the name of the engraver, Heine, engraved in the stone, a very fine work, 45*l.* (Salviati); a cornelian intaglio, Cupid coming from a broken egg, inscribed with the engraver's name, 39*l.* (Williams); an emerald cameo, full-faced head of Neptune, 47*l.* (Schmidt); sardonyx intaglio, Mars armed, 21*l.*; Nicolo intaglio, Indian Bacchus, 30*l.*; sard intaglio, a Faun, 23*l.*; a Greek cylinder of hematite, engraved as an intaglio, with a Bacchanalian subject, a Menade holding a thyrsus and dancing, a remarkable work, 190*l.* (Jackson); onyx cameo, sacrifice to Pan, 21*l.*; a sardonyx cameo (pierced), Sileus and a nymph seated on a stool, making young Bacchus dance, the whole overshadowed by a tree, 50*l.* (Schmidt); another, head of young Hercules, with a lion passant on the reverse, 31*l.* (Schmidt); an onyx cameo, Hercules carrying a small column on his shoulder, with an inscription by a modern hand, 118*l.* (Jackson); a cornelian intaglio, Achilles wounded, 81*l.*; a profile head of Julia Donna, in beryl, 22*l.* 10*s.* (Castellani); a sardonyx cameo, a helmeted and bearded head (perhaps of Julian the Apostate), 60*l.* (Riach); a sard intaglio, a wounded warrior, seated, 35*l.* (Fenardint); onyx cameo, Victory winged, with a fruit tree and a she-goat, 180*l.*; an onyx cameo, full-faced head of Medusa, 100*l.*; sard; a bearded mask, 23*l.* In the series of gems inscribed with the names of modern artists, we may mention a dark sard intaglio, representing Parnassus, by Berini, 24*l.*; a rock turquoise cameo, by Scarletti, with figures of Mercury and Paris, 27*l.*; garnet, head of Henry IV., 23*l.*; the heads of Henri IV. and Marie de Medicis, face to face, in sapphire, inscribed by Colderé and dated 1605, 80*l.* The collection produced 3,740*l.*

THE objects of art belonging to the late Madame Lenoir were sold at the end of last month, at the Hôtel Drouot, and the following prices obtained: Boucher, *The Mill*, 7,200 *fr.*; painting after Boucher, *Cupids Flying*, a pair, 1,750 *fr.*; Van Dael, *Flowers in a Marble Vase*, 2,960 *fr.*; Demarne, *The Wounded Soldier*, 3,100 *fr.*; Gleyre, *The Bath of Diana*, 9,700 *fr.*, and *The Nubian Slave*, 7,000 *fr.*; Janneck, *Concert after Supper*, and *Dancers*, the pair, 5,200 *fr.*; Pater, *The Fortune-Teller*, 28,000 *fr.*, and *The Encampment*, 9,950 *fr.*; A. v. Ostade, *Smokers*, a water-colour drawing, 1,020 *fr.* The diamond rivière, consisting of 103 brilliants, in three rows, sold for

48,110 fr.; a large brooch or stomacher, 15,805 fr.; a pair of earrings, 15,050 fr.; five little brooches with a single pearl, surrounded by a double row of brilliants, 22,450 fr.; female portrait on enamel, by Petitot, 3,400 fr.; portrait of Queen Marie Antoinette, enamel, 3,235 fr.; portraits of Adrienne Lecouvreur and of Lekain, on enamel, 1,550 fr.; Indian poignard, with jade handle encrusted with precious stones, 1,600 fr.; Cupid standing, marble, of Louis XV. period, 2,000 fr.; Venus, standing, marble, of Louis XVI. period, 5,400 fr.; equestrian statue of Louis XIV., 2,000 fr.; double light held by a Cupid, 3,400 fr.; clock and barometer in carved and gilt wood frames, 3,500 fr.; Florentine mosaic table, 2,200 fr.

NOTES AND NEWS.

THERE has been on view, at Phillip's, in Bond-street, last week, a most beautiful suite of Turkish embroidery, consisting of the whole furniture of a drawing-room, a carpet 21 feet square, with curtains, portières, covers for tables, sofas, divan, chairs, and stools. The work is entirely executed by hand on black satin; the embroidery in coloured silks, gold and silver, done in "laid" work, that is, the silks are laid upon the black satin ground, and fastened down by means of stitches made at short intervals with a fine, invisible silk, the whole outlined with gold braid. The effect is most brilliant, the patterns in the geometric, kaleidoscopic style of Oriental design, the conventional leafage perhaps more trailing and more pointed than in the Indian or Persian patterns. The silks probably are the produce of Broussa, the embroidery executed at Constantinople—an order for some imperial palace. The whole was put up to sale on Monday, but no bidder appeared, and it will probably be sent to Paris, the best mart for objects such as these. The price asked is 2,000*l*.

WE may refer our readers to the *Sicle* of June 22, for an able article in which M. Charles Bigot, *à propos* of the Alsace-Lorraine Exhibition at the Palais Bourbon, has set himself to demolish some of the fame of Decamps. After analysing many of Decamps's highly-praised works, M. Bigot points out somewhat elaborately in what way they fail to really represent that local colour of the East, which their admirers imagine that they represent so well; and after further shrewd criticisms, he ends by stating without prejudice such good qualities as Decamps actually possessed.

THE French Union of Fine Arts applied to Industry will open its fourth exhibition on August 10, at the Palais de l'Industrie, soon after the closing of the Salon. As we have before stated, the speciality of this exhibition will be a collection of costumes, either original or copies, dating from the earliest times when man assumed the dignity of a clothes-wearing animal, to the eighteenth century, when, according to the great Clothes-Philosopher, he became a mere human clothes-peg.

A NEW method of casting statues in bronze is reported as having been discovered by a Venetian founder, named Giordani. The advantage of the method consists in the cast being effected in a single operation, no matter how large the model or how complicated in its forms. A Leda cast by this process is now being exhibited in Venice.

THE *Architect* understands that the painting on which Miss Thompson is at present engaged has for its subject a charge of French cavalry against an English infantry regiment, formed in hollow square—a scene from the battle of Waterloo.

A FINE Art and Industrial Exhibition will be held at Cherbourg in August, from the 20th to the 30th of the month. Contributions must be sent in before July 15 to the President of the Société Artistique et Industrielle à Cherbourg. Medals will be awarded at the close of the exhibition.

THE four panels that have been painted by M. G. Boulanger for the new French Opera-house are now exhibiting at the Ecole des Beaux-Arts. M. Baudry's panels will be exhibited in August.

THE town of Saint-Malo is about to erect a bronze statue to Chateaubriand.

THE tomb of Abelard and Héloïse, in Père-la-Chaise, is to be restored. The present tomb was constructed about fifty years ago by a M. Lenoir, but it has fallen into a deplorable state of dilapidation. These celebrated lovers have not been allowed to rest in peace even in death. Six times have their remains been removed from place to place, and now, as a last persecution, they must, forsooth, be "restored."

FINE art exhibitions are really becoming as plentiful as blackberries. Even the Chilean Government must needs follow the fashion, and announce an exhibition of works of art, manufactured articles, and agricultural implements, to be held at Santiago on September 10, 1875.

THE beautiful parish church of Hythe is to be restored. It is one of the most perfect specimens of Early English architecture that we have in Kent. Mr. G. E. Street, who has prepared the plans and estimates for the restoration, says of it in his report:—

"For its size I think it almost, if not quite, the most artistically designed building in England. It is not only the rich details with which it is adorned make it interesting, but also the extreme skill with which its architect has combined the simplest sort of nave with the most sumptuous and splendid chancel."

Its crypt also is remarkable: in it a large collection of human bones has been preserved since the time of a memorable battle between the men of Kent and the Danes.

THE Archaeological Society of Athens has taken steps to prevent further spoliation of the tombs at Tanagra, in Boeotia, which for some time now have been supplying the market with large numbers of the most exquisite terra-cotta statuettes. Not to mention those which have passed into private hands in all directions, the Louvre alone is said to have acquired over sixty specimens. The tombs in question range in three parallel lines along the foot of a small hill near the modern village of Skimatri, and on the site of the ancient Tanagra. They are mostly formed of large blocks of stone coated in the inside with stucco. Those of the first line, nearest the hill, appear to be the most ancient, some of them being cut in the rock. Others are clearly not earlier than the Macedonian period, while some are as late as Roman times. In nearly all have been found terra-cotta figures painted with bright fresh colours, such as would be attractive in a household, and, thanks to their having been placed within strong vases, they have been found in almost perfect preservation. In point of artistic merit they vary much, though all have a oneness of character which, when compared with that of the terra-cottas from Athens, Corinth, or Cyrene, will show that Tanagra must have had a style of its own in work of this class, if not also in a higher art. Mythological subjects are exceedingly rare. We have instead figures of old nurses with children in their laps, beautiful youths and maidens dressed in bright colours, an aged beggar, a group representing a scene in a barber's shop, figures of animals, and in short just such subjects as the experience of to-day shows to be most attractive to those who furnish household ornaments. Besides these statuettes and groups there have also been found several specimens of what is still a very rare class of ancient vases, viz.: of green glazed ware, with moulded ornaments in the manner of the Samian ware. M. Otto Lüders, writing from Athens (*Bullettino dell' Inst. corrisp. Arch.*, May), is of opinion, from what he has seen of these terra-cottas, that they belong to that period of Macedonian or Hellenistic art the influence of which

Helbig has so clearly traced in the wall-paintings of Pompeii and the other Campanian towns destroyed by Vesuvius. Asevidence of this he points to seven figures of winged Cupids, which strikingly resemble in treatment the figures of Cupids in Pompeian paintings. But the final solution of this problem depends on the care bestowed on future excavations among these tombs. Several inscriptions, which from palaeographical grounds might have gone far to determine the date of the objects found beside them, have already come to light, but apparently without any note having been made of the precise place where they were discovered.

THE treasures of the cathedral of Monza are about to be shown for the first time to the public. On the 9th instant, a deputation from the historic exhibition of the industrial arts went to Monza to receive them from the chapter of the cathedral, where they have been carefully preserved for centuries. The arch-priest and his staff formally consigned them to their keeping, and an escort of carabinieri accompanied them to Milan, preceded by a carriage containing the members of the committee, and the cathedral authorities who have the charge of the precious relics. They will be guarded by the military during their absence from the sacristy of Monza.

These interesting specimens of goldsmith's work, some of the sixth century, consist of the famed iron crown of the Lombards, gift of Pope Gregory the Great to Queen Theolinda, a kind of carcanet or jointed circlet of gold, loaded with precious stones, and the "santo chiodo," or nail of the cross, whence it derives its name, hammered into a thin fillet of the iron within. Her cup of gold, said to be hollowed out of a single sapphire (probably glass, as the emerald of the "sacro catino" of Genoa). Her comb of gold filagree and emeralds, and her fan, or flabellum, of painted leather, the handle encrusted with jewels. The Gregorian present of the Gospels enclosed in a rich box ornamented with precious stones, and the cover of an Evangeliary with similar decoration. Her pectoral cross of rock crystal, used at the coronation of the Emperor of Germany. Her celebrated "chioccia," the hen and seven chickens of gold, with ruby eyes, picking up corn, on a kind of tray or plateau, said by some to bear a symbolic signification, by others to be simply a table ornament. Among the treasures are also the cross of King Berenger, a silver monstrance resplendent with diamonds and other precious stones. The chalice of Archbishop Giovanni Visconti, and the iron sword of Ettore Visconti, to which the Italian journal which gives this enumeration adds the crown of Theolinda's husband, Agilulf; but that was carried to Paris, and stolen, in 1803, from the Imperial Library.

WE learn from the *Times* that an "Exposition rétrospective d'Art religieux," containing upwards of 3,000 items, has been opened in the Town Hall at Lille. Twenty-five rooms are filled with illuminated missals and manuscripts, tapestry, embroidery, priestly ornaments in gold, silver, and enamels. The oldest and richest families and communities in the north of France, emulating the spirit which has collected the treasures now exhibited in Paris, in the rooms of the Corps Législatif, have lent their most valuable articles in ivory, wood, or marble, in pottery and terra cotta, church furniture, and devotional objects used in private life. A feature most appropriate in an age of pilgrimages and rambling devotions from across the narrow and the broad seas is a very complete display of ancient pilgrims' tokens and badges, in lateen, lead, and pewter.

THE well-known Italian painter, Arnold Corrodi, died at Rome on June 9, at the early age of twenty-eight.

DR. MORDTMANN, in a letter to the *Allgemeine Zeitung*, strongly expresses his conviction of the genuineness of the Moabite antiquities, and of the integrity of their discoverers. He is of opinion

that M. Clermont-Ganneau has not exercised his usual circumspection in the manner in which he endeavoured to throw discredit on their presumed antiquity; and he mentions that although the result of the investigation lately instituted at Jerusalem to test the trustworthiness of M. Ganneau's informants has not yet been made public, the opinion is very prevalent in that city that the persons in question are wholly unworthy of credit, while the character of M. Shapira, through whom the Moabite antiquities passed into the possession of the German Government, is universally regarded as unimpeachable with regard to general integrity and trustworthiness.

THE German papers report that Herr Küsthardt has nearly completed the copy which he has been engaged to make for the South Kensington Museum of the great lantern of Hildesheim. This curious relic of early German art, of which Herr Küsthardt's copy is to be a perfect fac-simile, except only in regard to some injudicious restorations of 1818, dates from the eleventh century, having been begun under the celebrated Bishop Bernward, of Hildesheim, who died in 1022, and completed under Bishop Hiezilo, whose episcopal rule ends with the close of 1079. The lantern, which is intended to symbolize the New Jerusalem, consists of a large gold ball, from which diverge four iron rods, which again ramify into the twelve branches that support the elaborately carved and massive crown intended to carry the lights. The main ornamentation of this expansive circle, which measures nearly 60 feet round, consists in twenty-four turrets, between which seventy-two sockets for candles are inserted into an iron framework, which shows the same design as the *à jour* fretwork of the turrets. As the "New Jerusalem lantern" of the cathedral at Hildesheim has long ranked as one of the most interesting of the numerous relics of mediæval German art, in which the ancient city of the Hildesheimer Prince-Bishops is so exceptionally rich, the authorities of South Kensington Museum must be commended for the commission which they have given to Herr Küsthardt, whose reputation has been established by the success with which he has made casts and copies of the ancient silver plate belonging to his native city.

THE STAGE.

THE COMEDY AT THE VAUDEVILLE.

THE career of Mr. Boucicault teaches a lesson to our younger writers, and to many a *dilettante* critic, if they will but choose to profit by it; and by nothing in the work of that career is the lesson more forcibly brought home than by the particular comedy now acted at the Vaudeville—*Old Heads and Young Hearts*—revived a few days since. Written in the days of the elegance of Vestris, the days when Planché made scholarly fun, and then accepted as a comedy of value, it is hardly likely that this early piece of Mr. Boucicault's could have been wanting in finish, in brightness, and at all events in the appearance of art. Nor is it indeed found, whatever may be its faults, to be wanting in these things. But Mr. Boucicault had the sagacity to understand that literary art is not sufficient for the Theatre. He saw that the acted drama, though it needs style, needs also emotions and situations. He set himself closely to observe what is effective for the stage, and to reproduce it with accuracy. He took care that his work was ornamental, but he took care first that it was closely knit. He planned a compact story, and sprinkled it over with epigrams. And if at last the epigrams did only look like Sheridan by candle-light, there was work beneath them which would stand the test of time and any light.

Not indeed that his construction was faultless; nor that his later work is equal to the promise of the beginning. Very likely he looked at things too much from the purely theatrical point of view, and instead of being, as Joubert said of himself, careless of fame so that he reached

perfection, he was probably careless of perfection so that he reached fame. The chief praise for him is that he was intensely practical and intensely sagacious. He was a gifted man, and like a far more gifted man—Charles Dickens—he was determined that his gifts should "tell." Where men as good as Schiller and as great as Goethe failed in their stage experience—and that Weimar history may be read with infinite profit—a man like Mr. Boucicault succeeded. Men of genius, but of genius not dramatic, produced their work to empty theatres or chilly audiences. A sagacious man of talent, unburdened by theories, produced stage work which, seen in the peculiar light of the theatre, delighted our fathers and delights us to-day.

One or two points in the play itself it may be well to notice, before we chat on the performance. Young Mr. Littleton Coke is a barrister of an age when fiction still represented it to be possible to impose upon a sharp public and sharper attorneys by carrying crammed-full bags with the busiest of airs. He means very well; he is given at last that money which is the final reward of merit; and he is paired off, too, before the curtain drops, with a young woman of much geniality of heart and uncommon freedom of manner. Why, then, in the first act, is his talk made so disagreeably cynical? The cynicism does not there appear to be superficial—does not appear to be assumed, because it is pleasanter to be witty than dull, and easier to be witty when one is malicious and incredulous than when one is quite amiable and confiding. That would have been entirely natural; but the deeply-rooted cynicism of Mr. Littleton Coke is a sacrifice of truth to effect. Then, again, the first act shows some weak construction—a device more plausible than probable. The well-disposed country brother—the coal-owner—is too easily allowed to deceive himself into the belief that the town brother—the barrister—is set against him, and will refuse his good offices; though the means, the mistakes, by which in the subsequent acts the estrangement is continued are adroitly and not unnaturally contrived. The characters themselves are individual, but not great. They are not quite new, yet are not too familiar. That is true of Boucicault which M. Legouvé lately said of Scribe—he was occupied not so much in creating characters as in tracing rôles for the stage.

Had it not been that one or two excellent actors had not had full time to learn their parts, and that accordingly in the first act of the play there was more prompting than is pleasant to listen to if one is near, though not enough to embarrass the action of the personages, the performance of Friday week would have been wholly satisfactory, and a result attained such as is rarely reached in a London theatre. As it was, the success was undoubted, and the reception enthusiastic. The two great parts are those of Tom Coke, the honest country fellow, who doesn't enjoy the fortune that was meant for his brother, and Lady Alice Hawthorn—a near relative of Lady Gay Spanker, of *London Assurance*—a young woman who flirts through four acts, and vows constancy at the end of the fifth. These parts were played by Mr. David James and Miss Amy Roselle—the lady being one of two additions (Mr. Righton was the other) which the shrewdness of the management had prompted them, in the absence of Miss Fawcitt and of any actor specially fitted for the part of the lawyer's servant, to secure for these performances. If one says that Mr. David James's acting was excellent, one may perhaps be allowed to add that its excellence was a surprise. He has played some parts indifferently, and many well, but nothing half so well; and moreover there had not previously been reason to suppose him master of so genuine, and reserved, and manly a pathos. He had learnt the northern accent very truly, and so was able to be rough enough to satisfy the popular superstition as to the appearance of a man who is to turn out full of self-sacrifice and honesty. The general conception was good; the detail was good; but that which was best was

the moment of declaration to Lady Alice of his love—the moment of his reception of her quick refusal of him. Here Mr. James's acting called forth applause which was entirely merited.

Lady Alice was played long ago by Madame Vestris. Doubtless it was a happiness to see her in the part. But there is good fortune also for those who never saw Madame Vestris—they are in a position to be satisfied with Miss Amy Roselle. There are certain drawbacks to Miss Roselle's talent. She is inclined to be imitative, and she has been much with Mrs. Kendal; and an impressionable artist—imitative now and then, whether she will or no—is more likely to catch Mrs. Kendal's mannerisms than Mrs. Kendal's artistic excellence. And to these Miss Roselle has added, quite unnecessarily, some little mannerism of her own. She has also one grave deficiency—she has not yet found any adequate expression for strong personal feeling. But the sort of courteous good feeling which comes naturally to us about the sorrows of other people who are near to us, she expresses with peculiar and exceptional truth, and there are one or two opportunities for observing this in the performance now under notice. Observe, too, how just before the close of the second act—a close, by-the-by, made singularly effective through Mr. Charles Warner's gathering impatience, irritability, and rage—Miss Roselle indicates, at Littleton Coke's refusal to shake hands with his brother, a subdued disappointment, which is half the result of good feeling and half the result of good manners. That feeling, and all the lighter feelings that are akin to it—the emotions of the drawing-room as distinguished from the emotions of the heart—are expressed as well as it is possible to express them. In the third act, her bearing to Mr. Littleton Coke, with whom Lady Alice is secretly in love, is that of an already accomplished *comédienne*. The attitude is admirable, and so is the slight satire in the tone—"rather a warm correspondence—that of yours." And in the fourth act, where she surprises her lover with the information that the love-letter she has dictated to him is in truth destined for himself, there is on the part of the actress a most frank and merry abandonment to the requirements of the scene; and, as some of the foregoing remarks should have implied, the character is throughout presented by Miss Roselle with an elegance and distinction now rare upon the stage.

Mr. Charles Warner does his best with a character with which it is not easy to sympathise. You may forgive the man's extravagance and recklessness, but not so easily his bitterness and resentment. But Mr. Warner makes him endurable when it is possible to do so; and when he is unendurable, then, at all events, he is forcible. "Shall I ring for your dog, or my brother?" asks Littleton Coke once in the piece, and he asks that with just the irritation of a man who is wrought upon by disappointment, jealousy, and scorn. The moment is worthy of notice, along with that other which has been already particularised. The parts performed by Mr. Farren and Mr. Thomas Thorne are in a sense secondary, but they have the greatest influence, conscious and unconscious, on the fortunes of the young people in the piece. Mr. Farren represents the Reverend Jesse Rural, an aged country clergyman, whose heart is in the other world, but whose head is hardly in this. The benignity of the man, and his infirmity, his mental confusion, his peacefulness of heart—all are indicated by Mr. Farren with skill, and the appearance of the actor is only less picturesque than in his part in the *Road to Ruin*. Colonel Rocket is played by Mr. Thorne with much energy and effect. The part is something of a caricature; yet at the bottom of it there is the truth that gives it point. On the occasion of the benefit, when the piece was produced, Mr. Righton, of the Olympic, played Mr. Coke's faithful servant with great crispness, precision, and *bonhomie*. Lady Pom-pion's is a character to which Miss Larkin does much justice; and, coming to the representatives

of parts which are not of high importance, one may say that Mr. Horace Wigan is satisfactory as Lord Pompion; that Mr. Teesdale as Lord Charles Roebuck would be competent did he not threaten to make a mannerism of haste and jerkiness; and that Miss K. Bishop—a very orderly village schoolmistress in *Pride*—has not quite the spirit required for the due presentment of the adopted daughter of Colonel Rocket and the regiment.

FREDERICK WEDMORE.

WE understand that the Lyceum company goes to the Standard Theatre very soon after the close of the season in Wellington Street; and that Mr. Irving will also act in the country during a part of the recess.

ON Saturday next, and for a short while afterwards, the Queen's Theatre will be tenanted by the Paris Vaudeville Company, headed by their great *comédienne*, Madame Fargueil. Sardou's *L'Oncle Sam* is the first piece to be played. It will be followed by *Les Pattes de Mouche*.

NEW YORK is promising itself that when Mr. Sothern comes back to the Haymarket, at Christmas, it will have Mr. and Mrs. Kendal in his place.

THERE is a rumour to the effect that Mr. W. B. Donne is going to resign his office in the Lord Chamberlain's department.

MR. J. CLARKE has appeared at the Criterion Theatre in his favourite part in *The Bonnie Fishwife*.

MR. ARTHUR CECIL, whose first appearance at a regular theatre we spoke of two or three months ago, has passed over, at all events for the time, from the Globe to the Gaiety, and has appeared, along with Mr. Charles Mathews, in a little piece of Mr. Tom Taylor's, called *A Nice Firm*. This was last week, when we should have chronicled it, had space permitted; for the performance was a good one, showing the actor's advance in his art. Mr. Cecil is an exceedingly intelligent comedian, whose progress it will be interesting to note.

THERE have been three new pieces at the Gymnase Theatre, all of them of the kind known as "summer pieces"; that is, they are pieces which the manager couldn't surely count upon, but thought worthy of producing as an experiment. An experiment of this sort, when the work produced is that of inexperienced or unknown men, is sometimes successful and interesting. Every now and then a new talent comes to light by this means; but on the present occasion that has not been the case. *Dubois d'Australie* is a two-act comedy by M. Gustave Nadaud. He is a new writer, but the subject of his piece is old, though he has dressed it in very modern dialogue: in the Paris talk of eighteen seventy-four. Thirty years ago Alphonse Karr narrated the same history, a good deal better. *Le Chevalier Baptiste* is also the production of a new man, or of new men, rather; for though one man is generally enough to write a tragedy, it generally takes two, and sometimes three, to write a vaudeville. The two have not succeeded very well, though they have not absolutely failed. The third piece is the work of a middle-aged man who is a known author. M. Edouard Plouvier wrote a four-act drama for the Odéon, a couple of years ago. It was voted dull, and withdrawn after a few performances; but it was recognised that in it there were ideas which the author apparently had not had the skill to work out. He needed, it was said, a collaborator. And the new piece—a piece with only two characters—fails for the same reason. Without being commonplace, *La Dragonne* is not successful. The heroine is believed by the audience to be as faultless as she is first of all believed by the man whom she loves, and the revelation, when it comes, is a shock too unskillfully given. Moreover, the piece is not very well acted. No artist of high distinction appears in any of these summer productions.

THE judgment pronounced by M. Francisque Sarcey—the keenest and severest of French dramatic critics—on M. Paul Ferrier's *Tabarin* is in accord with a statement we made about the piece when the piece was yet in manuscript. It bears upon it too evidently the signs that it was written for one actor—that actor the elder Coquelin. Against this practice invading the Théâtre Français, M. Sarcey makes a well-merited protest. Let it be kept, he says, to the *théâtres de genre*. And it is bad enough there. In intellectual interest, if not in a material sense, our Haymarket—a house of comedy—has suffered severely by its one-part pieces written for Mr. Sothern. To write a piece to display a given actor is no doubt, under many circumstances, a very excusable, sometimes even a very advantageous act; but to do so at a great theatre like the Français, existing as much for the encouragement of high dramatic literature as for the encouragement of good acting, is to reverse the natural order of things. M. Francisque Sarcey may well ask where this can stop, if once it is allowed in good earnest to begin. Where, he enquires, is the piece for Got?—the piece for Mdlle. Sarah Bernhardt? "Let Meilhac and Halévy write a scene for Chaumont at the Varieties, or Noriac contrive a monologue for Judic at the Bouffes. But in the house of Molière pains should be taken to write a piece, actually a piece, and not a monologue broken only by occasional replies."

MR. HENRY IRVING took a benefit at the Lyceum Theatre on Monday, when he appeared, before a very large and very distinguished audience, in two characters: in that of Eugene Aram, in Mr. W. G. Wills's poetical setting of the famous story; and as Jeremy Diddler, in the farce of *Raising the Wind*—a farce written in days when farces were sometimes funny. The performance of *Eugene Aram* has been repeated during the week, and Mr. Irving, on his resumption of the character created by him on the stage a year or so ago, has done more than sustain the reputation then achieved in it. His performance is still beset with little faults—the mannerisms that are his own—but on the whole it is not too much to say that no performance of equal impressiveness has been seen of late in England. It is, if possible, even more remarkable than his acting in *The Bells*; for it is more delicately toned and measured, and it ends with a scene which calls for and does actually display greater intellectual and imaginative power than that which is shown in the famous last scene of the Erckmann-Chatrian's weird story; and it includes no such physical horror as that which, in the performance of *The Bells*, mars even while it impresses. Certainly the death scene is too long drawn out, and in the hands of any but an extraordinarily gifted actor, would become monotonous in its weary expression of helplessness and hopelessness, remorse and misery. The play about the cross verges on melodrama; or if it does not verge on melodrama, then it is a lesson too distinctly religious to be quite fitting for a theatre. But the scene affords many opportunities for the presentation of the strongest emotion, and hardly one of these does Mr. Irving let slip. More than this, he is singularly varied. Thought chases thought, and the track of each is seen upon his face. He is equally true and remarkable when expressing his penitence in solitude, and narrating to his betrothed, Ruth Meadows, the earlier incidents of the story of so many years ago, and passing on to a most vivid presentment of the passion and rage which led (in Mr. Wills's version) to the actual murder; and though easy, yet it is not more easy to Mr. Irving to put before his audience with curious vividness the one moment of the deed and the bodily horror of it, than to put before them the burden on the mind of its perpetual presence—the sense that this one act, though the work of a minute, is yet, in its far-reaching influences, an eternal thing. But perhaps it is in the second scene that the dramatic

effects produced by Mr. Irving are most immediately striking. It is the evening before Eugene Aram's marriage with the Vicar's daughter, and the quiet of the parsonage is interrupted by the advent of Houseman, the old accomplice of the schoolmaster—an accomplice who has come for money as the price of silence. Mr. Irving's bearing towards this man is conceived with high imaginative power, and carried out with such a command of the resources of intonation, gesture, and facial expression, as is but seldom to be seen. The sudden rage at the treachery of the accomplice, the quite murderous violence, the instant coolness, the calm defiance that follows on reflection—he, Eugene Aram, being safe now, behind his "rampart of love and honour"—this is all shown with the means of a great though uncertain artist: means which can be used, however, in this way at the dictation of genius alone. More might have been done, we think, to support the life-likeness of the performance. It is not well to trust so exclusively to the art and genius of one exceptional man. Miss Isabel Bateman, it is true, makes a graceful figure as Ruth Meadows, and Mr. Edgar's Richard Houseman is not without force; but even these performances are open to improvement—Mr. Edgar's force being a little too stagey, and Miss Bateman's delivery being, though always intelligent, a little too measured for simplicity—while the representatives of the Knaresborough Parson and his free-spoken gardener appear wanting in the power to present definite characters, which need not be the less finished because their words are few.

MUSIC.

THE HANDEL FESTIVAL.

THE triennial commemoration of Handel by a performance of his music at the Crystal Palace on the grandest possible scale has now become an established institution. It is needless to do more than remind our readers that the idea of a great Handel Festival first suggested itself as the centenary of the composer's death approached. A preliminary festival was held at the Crystal Palace in 1857 as an experiment to determine its fitness as the place for the proposed celebration; and the success, though less in a musical point of view than some of the festivals which have since been held in the same building, was sufficient to establish beyond doubt that the great transept at Sydenham was, with such acoustic improvements as experience suggested, the place of all places for musical performances on the scale intended. The chief alterations made since the first festival have been the enclosing of the sides and back of the enormous orchestra, and the erection of the solid boarded roof, which largely prevents the dispersion of the sound so noticeable at the earlier performances.

The actual centenary festival took place in 1859, and it was attended with such success—upwards of 81,000 persons being present on the four days which it occupied—that it was resolved to establish a Triennial Festival of a similar character, a resolution which has since been regularly carried out. The one which was brought to a close yesterday is therefore the fifth of the series.

The number of performers at the Festival was advertised as four thousand. This, however, is a very rough estimate, as the list of the band and chorus given in the book of words includes 3,428 names, and if to these are added the soloists, with the most liberal allowance for "supers," the aggregate force can hardly exceed 3,500. For the sake of those who take an interest in statistics, we will add that the performers are thus distributed: 371 stringed and 84 wind and percussion instrument players, and 2,972 chorus singers; besides these there are the organist, the principal vocalists, &c., numbering in all, perhaps, some 30 more.

There is probably no music in existence except that of Handel which would bear advantageously

so enormous a reduplication of force as that to be found at one of these festivals. Indeed the experiment has been tried and (comparatively speaking) has failed. Mendelssohn's *Elijah* (with the exception of the same composer's *St. Paul*, the greatest oratorio since Handel) was performed some years since at the Crystal Palace on nearly, if not quite, the same scale as that of the triennial festivals; but the result showed that while in isolated portions magnificent results were realised, the work as a whole did not, and could not, produce such an effect, under such circumstances, as the *Messiah* or *Israel*. Nor is the cause far to seek. Undoubtedly the pieces which produce most effect at Sydenham are the choruses. And in his choruses Handel stands alone. We are not unmindful of the grandeur of Bach's *Passion*, of certain movements (such as the "Holy, holy") of the *Elijah*, or of Beethoven's great Mass in D; but for a certain solid and massive simplicity, Handel is, and probably always will remain, unrivalled. Beethoven is reported to have said of him, "Handel is the great master of all masters. Go, learn from him how with such simple means to produce such great effects." This is, in fact, the true secret of the stupendous effect of many of Handel's choruses. He lays on his colours, so to speak, with a thick brush. A few broad touches, and the whole picture is finished. We find hardly any of the delicacies and intricacies of modern instrumentation. Some of his grandest movements—such, for example, as "He trusted in God"—consist of nothing but a plain four-part harmony for voices and strings; but for this very reason they will bear the reduplication of the parts to any extent; for there is no fear of destroying the "balance of power," as would inevitably be the result were much of our modern music subjected to the same process.

It is not difficult to see why a "Handel" Festival should, from another point of view, be a greater success than a "Beethoven" or "Mendelssohn" Festival would be. Handel is pre-eminently a popular composer. His music can always be understood on a first hearing, while many of Mendelssohn's works, and still more of Beethoven's, require a certain amount of musical education for their proper appreciation. Moreover, Handel's music is much better known. It would be difficult to find an educated person in this country who never heard of the *Messiah*, while there are probably hundreds who know nothing about *Elijah* or the *Mount of Olives*.

With respect to the programmes it may be said that the festivals pass and resemble one another. Each begins with a full public rehearsal; the first and third days are invariably devoted respectively to the *Messiah* and *Israel in Egypt*; and the second day to a miscellaneous selection. Thus, on only one of the three days of the festival is any variety to be looked for. While this may be regretted, it can hardly be wondered at. No festival would be considered complete without Handel's *chef d'œuvre*, the *Messiah*; while the *Israel in Egypt*, being beyond all comparison his greatest choral work, is especially adapted for performance under such circumstances.

The full rehearsal, which took place yesterday week, commenced with the "Hallelujah" and "Amen" choruses from the *Messiah*, comprised nearly the whole of the Selection, and concluded with several numbers from the *Israel*. Being merely a rehearsal, a detailed criticism would be out of place. We shall therefore reserve any remarks upon the Selection till we come to speak of the Wednesday's performance, merely saying here that in several of the less familiar choruses the voices showed a painful uncertainty in their "attack," many of the points being most feebly taken up. On the other hand, some of the better-known movements were most effectively given. The greater number of the principal vocalists announced to perform at the festival took part in the rehearsal.

The festival itself began on Monday with the

Messiah. As usual on these occasions, the National Anthem, in Sir Michael Costa's effective arrangement, preceded the oratorio. It is next to impossible to write anything about Handel's masterpiece which has not been said scores of times before; but there are one or two points connected with such a performance which may be worth mentioning. And, first, as to the tone. It is a very common idea among those who have never heard a Handel Festival, that so many voices and instruments must "make a most tremendous noise." Nothing can be more erroneous. The mere noise in the enormous area of the Crystal Palace is far less than we have often felt it in Exeter Hall; but on the other hand the quality of tone resulting from the immense reduplication of parts is rich, full, and sonorous to an extent to be heard nowhere else. Most people know that if twenty violinists play a passage in unison, the effect, though each one separately may be but a very indifferent performer, is almost sure to be good; and at these festivals we have the same principle carried out to its extreme limit. Voices or instruments, by themselves harsh or poor in tone, become blended with the general mass, and aid in producing an ensemble which is unique.

Another point suggested by the performance on Monday is the comparative ineffectiveness of the solo voices in so vast a space. True, the magnificent organ of Mdle. Titiens rang through the central transept like the sound of a trumpet; but this was the exception; and although the directors of the Crystal Palace have done all that is possible towards rendering it acoustically perfect, and the press gallery is undoubtedly the best place for hearing in the whole building, many of the softer parts of the songs were, if not altogether lost, at least but indistinctly heard there.

Mr. Sims Reeves's absence on Monday, though not surprising to those who knew how much he had lately been out of health, was none the less a cause of great regret. Among living tenors he undoubtedly holds the first place as a Handelian singer, and Mr. Vernon Rigby, who took his place, though a most efficient substitute, could hardly make us forget his absence.

Taking it as a whole, the performance of the *Messiah* was one of the finest within our recollection. It was not free from occasional slips, as for instance in the chorus "And he shall purify," where the basses were in one place very uncertain about their key. On the other hand, some of the choruses, such as "For unto us," "Lift up your heads," and the "Hallelujah," were given with an effect and precision which were quite overpowering.

The soprano solos were divided between Mdle. Titiens and Mdme. Sinico, the former taking the first part, and the latter the second and third of the work. Mdle. Titiens' greatest success was made in the air "Rejoice greatly;" in "Come unto him" she was less happy, as she spoilt its close by a very tasteless *cadenza*, introducing the high B flat—a note her possession of which no one probably doubted, but which certainly no one wished proved in that place. We were the more surprised at its bad taste, as Mdle. Titiens is beyond all doubt a great artist. Mdme. Sinico's two songs, "How beautiful are the feet," and "I know that my Redeemer liveth," were both exceedingly well given. Mdme. Trebelli-Bettini gave an admirable reading of the alto solos in the first part, her rendering of the difficult air "But who may abide" calling for especial notice; she was replaced in the latter half of the oratorio by Mdme. Patey, whose chaste and tasteful singing of "He was despised" should not pass without mention.

With the exception of two short recitatives in the second part, and the tenor parts in the quartetts in the third part, which were carefully sung by Mr. Kerr Gedge, the whole of the tenor music (in the absence of Mr. Sims Reeves already referred to) fell into the hands of Mr. Vernon Rigby. His light voice failed at times to make

itself heard at a distance; but he sang extremely well, the "Passion" music being given with much taste, and the trying air, "Thou shalt break them," being declaimed with great fire. It is to be regretted that at the close of this song Mr. Rigby, following Mr. Reeves's example, brought in his "high A." Of course the note brings down tremendous applause; but it is none the less inartistic.

The bass music could not possibly have been in better hands than those of Signor Agnesi (for the first part) and Mr. Santley (for the second and third). Two more finished singers are not at present before the public. We can only mention the Signor's fine reading of "The people that walked in darkness," and Mr. Santley's rendering of "Why do the nations" and "The trumpet shall sound," in the latter of which Mr. Harper's trumpet *obbligato* was an important feature.

In speaking of the "Selection" given on Wednesday, it is our duty, in the first place, to enter the strongest possible protest against Sir Michael Costa's arbitrary and preposterous tampering in several places with Handel's text. We are not referring here at all to the additional accompaniments, which are not only a necessity for such a performance, but which, in the present instance, are cleverly and frequently very judiciously written. We speak of actual alterations of passages, and additions in some cases of whole bars to Handel's music. The very first piece in Wednesday's programme—the overture to the *Occasional Oratorio*—gave an instance of this. In the march with which it concludes, the conductor not only altered the rhythm in the latter half, but, with a bad taste which is almost inconceivable, positively added three chords of his own at the end! Had he designedly set himself to try how far it was possible to vulgarise and degrade a noble piece of music, he could hardly have been more completely successful. It is unpleasant to have to speak so strongly; but there are occasions when to be silent is to become a *particeps criminis*; and we should be failing in our duty both towards our readers and towards our art did we not condemn in the most unqualified language such musical vandalisms. The great influence of Sir Michael Costa in this country, and the weight of his authority, only render the protest the more needful.

To the *Occasional* overture, a considerable portion of which, owing to the alterations made in it, was a mere burlesque, succeeded a selection from *Saul*. This included the fine opening chorus, "How excellent thy name, O Lord;" the song "O Lord, whose mercies numberless," charmingly sung by Madame Trebelli-Bettini; the well-known "Envy, eldest born of hell"—one of the finest examples of the employment of a "ground bass" to be found in music; the "Dead March," which was spoilt, as far as it was possible to spoil it, by the conductor's arbitrary alterations of Handel's drum parts, and the splendid final chorus, "Gird on thy sword." All these pieces were exceedingly well given, the last-named showing a marked improvement on the performance at the rehearsal, when it was very unsteady. After Mr. Santley had sung "How willing my paternal love," from *Samson*, a most magnificent performance of the chorus "When his loud voice," from *Jephtha*, succeeded. The next item in the programme was the "Deeper and deeper still" and "Waft her, angels," from the same oratorio, for which Mr. Sims Reeves was announced. Considerable doubt was, however, felt about his appearance, and when he ascended the orchestra his reception was such as very seldom falls to the lot of a public performer. Though his voice was at times evidently not entirely under his control, he has perhaps never given a grander reading of this great scene than on this occasion. Mdle. Titiens should receive special thanks for her selection of the fine song from *Susanna*, "If guiltless blood be your intent." She might have chosen many pieces more showy; but, like a true artist, she preferred bringing forward Handel to bringing forward her-

self. The splendid chorus from the same oratorio, "Righteous heaven beholds their guile" was another great treat, though it hardly went so steadily as some of the more familiar pieces. Mme. Trebelli-Bettini then sang "Lord, to thee each night and day," from *Theodora*; and the massive chorus "Glory be to the Father," from the Utrecht *Jubilate*, concluded the first part, which, it should be mentioned, consisted entirely of sacred music.

Space will only allow a brief mention of the second (secular) part of the selection. It opened with the fourth Organ Concerto, the organ part being in the hands of Mr. Best, than whom no finer executant on his instrument could be named. The performance, however, was on the whole disappointing, partly because the organ and orchestra were in places not perfectly together, and partly because Mr. Best, being unable to hear properly the effect he was producing, was not always happy in his choice of stops. He certainly can have had no idea how harsh and "screamy" some of his combinations sounded at a distance, or he would most assuredly have modified them. In saying this, not the slightest reflection on Mr. Best is intended; for it was simply impossible for him to hear the organ as we heard it. His execution, it need hardly be added, was as masterly as ever.

The choruses in the second part were "O the pleasures of the plains," from *Acis and Galatea*, the opening of which was extraordinarily confused. "Wretched lovers," from the same work (to which Sir Michael Costa prefixed a prelude of several bars for the orchestra!); two choruses, "From Harmony," and "The trumpet's loud clangour" from *Dryden's Ode*; "The many rend the skies," from *Alexander's Feast*; and, for a *finale*, the ever-popular "See the conquering hero." Mme. Lemmens-Sherrington sang "Hush, ye pretty warbling choir;" Mlle. Titien gave the fine song "Ah, mio cor!" from *Alcina*; Mr. E. Lloyd sang with exquisite taste and finish "Love in her eyes sits playing," from *Acis*; Mr. Cummings gave with good effect "Where'er you walk," from *Semele*; Mr. Vernon Rigby declaimed the solo part in "The trumpet's loud clangour" with great force and spirit; and Mr. Santley sang his favourite "O ruddier than the cherry"—a masterly performance, the close of which was spoilt by the introduction, in very doubtful taste, of his "high G." It will be seen that the solo music needs but little comment. The whole selection, though somewhat too long, was highly enjoyable.

Of yesterday's performance of *Israel* the notice must be deferred till next week.

EBENEZER PROUT.

WE call attention to the announcement of Mr. Sims Reeves's Benefit Concert at the Albert Hall, which is to take place on Monday evening, feeling sure that all true lovers of music will be glad to avail themselves, if possible, of the opportunity of expressing their sympathy with one of our greatest and most genuine artists, whom indisposition has so long disabled from appearing in public.

At the unveiling of the statue of Hans Sachs at Nuremberg, which takes place (we believe) this week—the German papers do not give the exact date—among other festivities, two dramatic pieces by the old Meistersinger are to be performed.

On the occasion of Max Bruch's recent visit to Düsseldorf a grand concert was arranged in his honour, at which not only the choral societies of that town, but also choirs from Elberfeld, Barmen, Crefeld, and Neuss took part. The performers numbered some 500 voices, with a proportionately numerous orchestra, and Herr Bruch conducted. The programme consisted chiefly of his own compositions, including a Romance for violin, the "Schön Ellen," a scene from *Odysseus*, the "Frithjof-Sage," and the "Dithyrambe." Brahms's "Rhapsodie," and compositions by Gluck and Mozart were also given.

THE first performance at Weimar of Wagner's *Tristan and Isolde* took place on the 14th inst. The parts of Tristan and Isolde were filled respectively by Herr Vogl and his wife, whose interpretation of the excessively difficult music is spoken of in terms of the highest praise. Weimar now shares with Munich the honour of alone having ventured to produce this remarkable work.

It is stated that Wagner has invited Fräulein Oppenheim, of Frankfort-on-the-Maine, and Frau Blume-Santer to take part in his "Nibelungen" performance at Bayreuth.

It is gratifying to note the increasing popularity of really good music in France. At a recent concert in Caen, given by the Société des Beaux-arts, the programme included Beethoven's Pastoral Symphony, a symphony by Haydn, the overtures to *Guillaume Tell* and *Mosè in Egitto*, the larghetto from Mozart's Clarinet quintet, movements from Beethoven's Septet, and a selection from the *Midsummer Night's Dream* music.

THEODORE THOMAS, the well-known orchestral conductor at New York, has lately received a pleasing testimonial from his admirers. At one of his symphony concerts, at the Steinway Hall, he was presented, during a pause in the performance, with an elegant silver casket, containing a cheque for 3,500 dollars.

FROM a letter from Dr. Hanslick, of Vienna, which a townsman of his now in this country has just received, we learn with regret that this excellent critic has been for some time seriously ill, and is still unable to fulfil the duties of the post he discharges with such marked ability. Dr. Hanslick is at present staying near Klosterneuburg, on the Danube, and will shortly go to a watering-place, where it is to be hoped he will perfectly recover his health.

We regret to learn that the great bell for the cathedral of Cologne, in the casting and construction of which so much labour and skill had been expended, has been found so imperfect that the musical commission appointed to decide upon its merits have found it necessary, after their last and decisive test, to condemn it *in toto*. It was hoped that by repolishing certain portions of the interior the tone might be brought to the required note of C, from which it deviated very slightly, although quite appreciably; but the alterations, instead of bringing about the required result, have produced different inharmonious tones, and have, moreover, made apparent three distinct layers in the entire mass. The bell will, therefore, forthwith be broken up, and recast in the foundry of the original constructor, Herr Hamm, of Frankenthal.

POSTSCRIPT.

A REUTER'S telegram states that Professor Gneist will leave in about a week for Washington, for the purpose of making researches in the State archives for a history of the Constitution of the American Union. During his stay in Washington he will be the guest of President Grant.

THE *Athenæum* announces the death of Mr. Howard Staunton, the distinguished Shaksperian scholar, which occurred on Monday last.

THE *Times* is informed that M. Rochefort is preparing an account of events dating from the discontinuance of *La Lanterne*, with especial reference to their bearing upon the present political situation in France.

THE *Levant Herald* learns that Dr. Dethier, director of the Imperial Museum, who has recently returned from Greece, has been commissioned by the Porte to proceed to the Dardanelles for the purpose of visiting and inspecting the excavations made by Dr. Schliemann at Hisarlik. Meanwhile, the Government has directed a post of zaptiehs to be stationed on the spot in order to prevent any clandestine abstraction of antiquities and any further excavations without special permission of the authorities.

As a natural sequence to the late war, we find everywhere in Germany huge figures of Germania, with laurel crown and other insignia of victory, hoisted upon commemorative pedestals. So great indeed seems to be the demand for these national memorials, that the Fatherland finds it difficult to get artists competent to carry out its exultant ideas.

After two unsatisfactory competitions, the design of Professor Johannes Schilling, of Dresden, has at last been chosen, *faut de mieux* it would almost seem, for a national monument in the Niederwald. This monument, it is stated, is not intended merely as a memorial of the past war, but is meant to be a symbol in future ages of the national unity of Germany. No one less than a German Michael Angelo could hope to achieve such ambitious aims, and we doubt whether Germany has a Michael Angelo just now to perpetuate her greatness in marble and bronze. The only idea of German sculptors seems to be to make their figures of Germania bigger and bigger, as occasion requires.

Professor Schilling's Germania is a giantess forty feet in height. At the base of the pedestal on which she stands are groups representing the Rhine and the Moselle. Father Rhine is a mediaeval giant leaning against the conventional urn, and offering to the water-nymph who does duty for the Moselle, a watch-horn, as symbol of military service. Higher up on the four sides are tablets with figures of life-size or nearly, carved in such high relief that some of them are quite detached from the background. This mode of relief is effective enough in smaller subjects; we have a splendid example of it in Ghiberti's celebrated gates for instance; but such a picturesque style of sculpture does not seem appropriate on so large a scale as this. It is perhaps unfair to judge of the work before it is carried out, and at present it is only the design for it, now exhibiting in the Royal Art Academy of Berlin, that can be studied; but a nation cannot be too careful lest it saddle future generations with a national monument which, however well it may satisfy national pride, may yet be unsatisfactory as a work of art.
